Garvey's power and influence began to decline soon after the convention. In 1920–21, the United States suffered through an economic recession. As unemployment rose among African Americans, sales of Black Star Line stock plummeted. In addition to its financial troubles, Garvey faced harsh criticism from established African-American leaders, including A. Philip Randolph and W. E. B. DuBois. Critics questioned his financing of the Black Star Line. They charged that he was selling more stock than he legally could. In 1922, Garvey provided further fuel to the fire when he met with the second-in-command of the KU KLUX KLAN. His critics charged that he had made a deal with the Klan to remove African Americans from the United States, leaving it as the white man's country that Garvey had always claimed it was. Garvey responded to these charges by purging his critics from UNIA's leadership, but he did not last long enough to take advantage of this situation. He was convicted of mail fraud in a federal court in New York City in June of 1923. The court sentenced Garvey to five years in prison and a \$1,000 fine. After losing his appeal, he began to serve his sentence in 1925. In 1927, President Calvin Coolidge commuted his sentence, and Garvey was deported to Jamaica. Garvey attempted to re-create UNIA in Jamaica; but by the mid-1930s, both UNIA and Garvey had fallen into obscurity. He died in obscurity in 1940.

### Gastonia Strike (1929)

In the spring of 1929, 3,500 textile operators at the Loray Mill in Gastonia, North Carolina, went on strike against the company. Under the leadership of Fred Beale, the National Textile Workers Union, a union allied with the Communist Party, had been organizing in Gastonia for months. Low wages, the stretch-out system of assigning looms to workers, and long hours were among the workers' chief griev-

ances. On April 1, workers from both shifts walked out, demanding employers meet their demands and give the union recognition. They were met with a well-organized resistance. Local employers formed a Committee of One Hundred to break the strike, and the governor of the state sent in the National Guard to keep the mill open.

Within weeks of the walkout, thousands of workers in the Piedmont South joined the Gastonia workers in massive strikes in protest against employer decisions to increase their workload and lower wages. Impoverished not simply by a low-wage economy but also by a decade of recession in the textile industry, mill workers had been silent when employers speeded up the machines at which they worked. By 1929, however, the industry was showing some signs of revival. With that upturn, workers organized throughout the Piedmont region in North Carolina, South Carolina, and Georgia. While the campaign benefited from outside funding and leadership, some of its most visible labor activists were long-term employees with roots in local communities.

In Gastonia, labor violence escalated. Police and National Guardsmen harassed those walking the picket line, and a local crowd destroyed the union office. Employers then ordered the workers evicted from company housing. In an exchange of gunfire one night, the local chief of police was killed. Sixteen strikers and leaders, including Beale, were charged with the murder. Seven were eventually convicted of second-degree murder. They fled to the Soviet Union while out on bail. Locally, one worker, Ella Mae Wiggins, had caught the attention of the press with her songs written from her mill experience, such as the "Mill Mother's Lament." Wiggins became another victim of the violence. She was killed on September 14, when the car she was riding in was ambushed on the way to a strike meeting. Although five Loray Mill employees were charged, no one was convicted of her murder.

The fierceness of conflict between local workers and local police caught the attention of labor reformers nationwide. Reporters from labor and radical newspapers and organizers, some of whom belonged to the Communist Party, went south to support the strike. Newspaper reporters told the powerful story of how textile workers, long viewed as passive, stood up to employers. The strike also made it into radical literature as the subject of six novels, including MARY HEATON VORSE's *Strike!* (1930) and Fielding Burke's *Call Home the Heart* (1932). Still, the workers fought an uphill battle. Evictions from mill housing and lack of resources made it difficult for strikers to sustain the conflict. Although the conflict lasted throughout the summer, in Gastonia, as throughout the region, the strike was lost.

### General Electric (GE)

Created in 1892, the General Electric Company (GE) invented and produced numerous products that changed the way ordinary Americans lived their lives. GE's formation in 1892 was an attempt to manufacture and distribute many of the new electrical products that had been invented by Thomas Alva Edison and others. Edison had formed his own corporation, the Edison Electrical Light Company, in 1878, which then became the Edison General Electric Company. Engineered by financier J. P. Morgan, General Electric merged the competing manufacturers, Edison General and the Thomson-Houston Electric Company.

In 1900, GE created a research lab in Schenectady, New York, with the hope that it would be able to duplicate the kind of creative environment Edison had established at his famed Menlo Park. GE president Edwin Rice set out to hire leading scientists from around the world. According to Rice, "It has been deemed wise during the past year to establish a laboratory devoted exclusively to original research. It is hoped by this means that many profitable fields may be discovered." The idea of committing a large amount of money to research and development, with no guarantee that anything profitable or marketable would come from it, revolutionized American industry. Prior to the development of industrial research labs, innovations were the domain of individual scientists and inventors. Corporations emerged only after new products or new ideas were developed. GE spared no expense in building the labs, developed close ties with university science departments, and hired some of the leading scientists of the day, including Charles Steinmetz, William Coolidge, Irving Langmuir (who won the Nobel Prize in chemistry in 1932), and Willis Whitney. Whitney, who had been a chemistry professor at MIT prior to joining GE, served as head of the company's research lab between 1900 and 1928.

From the very beginning, the work of GE's research laboratory was extremely productive and profitable. Early triumphs included innovations in the incandescent light bulb, vacuum tubes, and an X-ray machine. Improvements in lighting allowed GE to play an important role in the emerging electrification and lighting industry as communities and individuals brought electricity and electric lighting into their towns and homes. By 1930, GE had become one of the most prominent and profitable companies in the country; and its products, including radios, refrigerators, and stoves, began appearing in every household.

### Gentlemen's Agreement (1907)

Following on decades of racial hostility toward Asians, the Gentlemen's Agreement of 1907 was an informal pact between the United States and Japan to slow emigration from Japan. Between the 1880s and the onset of WORLD WAR I, there was a steady increase in the number of immigrants to the United States. In 1907, at its height, some 1,285,349 immigrants entered the country. Asian immigration was a specific area of concern. By 1882, the federal government responded to the demands of white workers in California and enacted legislation that prohibited the entry of emigrants from China, in the Chinese Exclusion Act. While this legislation effectively halted the major source of Asian immigrants, it did not close the door to Asians. In 1885, the emperor of Japan lifted that country's prohibition on emigration, and a steady flow of Japanese laborers entered the United States. Their primary destination was the sovereign island kingdom Hawaii, where Japanese immigrants found employment on American sugar cane plantations. With the subsequent annexation of Hawaii by the United States in 1898, Japanese migrants were free to move to the continental United States. In the early part of the 20th century, Japanese immigrants entered the country at a rate of about 10,000 per year.

Although the number of immigrants reaching the United States from Japan and other Asiatic countries remained relatively small, opposition to Chinese, Japanese, and other Asian immigrants steadily mounted in places like California. In 1906, opposition to Japanese immigrants in California had reached a point where the San Francisco school board ordered the segregation of Japanese and other Asian schoolchildren. The school board and many white residents of San Francisco did not hide racist attitudes toward the Japanese. They argued for the segregation of the schools in order to prevent the "contamination" of white children. In addition to segregation, anti-Asian riots erupted in several California cities during 1906, including San Francisco and Los Angeles. California's anti-Asian prejudices were encouraged and fed by hysterical stories in the press about the "Yellow Peril" of Asian immigration. This so-called Yellow Peril caused outrage in Japan, and pro-military elements within the Tokyo government began calling for a war with the United States.

To calm tensions between the two countries and quiet public sentiment, President THEODORE ROOSEVELT sought to work out a solution with the Japanese government. The Gentlemen's Agreement with Japan in 1907 resolved the mounting tension between the two nations. In exchange for Japan agreeing to refuse passports to unskilled laborers seeking to immigrate to the United States, Roosevelt promised to have the San Francisco school board rescind its segregation order. While the agreement halted most migration between Japan and the United States, it did not bar Japanese residents already in the country from sending for their wives. Accordingly, thousands of Japanese women continued to enter the United States. Many of these immigrants were actually so-called picture brides who had been married by proxy in Japan in order to gain entry into the United States. Fearing that he would be attacked for being soft with the Japanese, President Roosevelt subsequently ordered the GREAT WHITE FLEET on its world tour late in 1907.

**Gershwin, George** (1898–1937) *composer, songwriter, pianist*

An important American composer, George Gershwin is remembered for his musical comedies, popular songs, orchestral works, and an opera, *Porgy and Bess*. Combining jazz and classical composition, Gershwin had many successes that crossed the line between classical and popular MUSIC, including *Rhapsody in Blue*, among the most frequently played pieces of American classical music.

George Gershwin (Jacob Gershovitz) was born in Brooklyn, New York, on September 26, 1898, the son of immigrant Russian Jewish parents. At the age of 12, he began to study the piano, and at age 15 wrote his first compositions. Gershwin studied with American composers Rubin Goldmark, Henry Cowell, and Wallingford Riegger and the Russian-born composer Joseph Schillinger. An accomplished pianist, Gershwin began his career in 1918 as a musician and song promoter for Jerome Remick Company, a TIN PAN ALLEY music publisher. In his songs, Gershwin drew upon the idioms and rhythms of JAZZ and BLUES music, as revealed in his first popular success, “Swanee.”

By the 1920s, Tin Pan Alley was declining in musical influence as sheet music gradually lost its popularity. It had fostered much new talent, including Gershwin and composer Irving Berlin, but Broadway theater companies

George Gershwin (Library of Congress)

slowly took its place as venues for introducing and distributing popular music. Both in New York and on tour, Broadway plays and reviews publicized new songs and composers. Starting off as a rehearsal pianist, Gershwin began composing for Broadway shows. In 1920, he wrote the entire score for the review *George White's Scandals*, which introduced him to theater audiences. Gershwin followed with a string of hit shows, including *Lady, Be Good* (1924), *Tip-Toes* (1925), *Oh, Kay!* (1926), *Funny Face* (1927), and *Girl Crazy* (1930). Working with his brother Ira, George produced such classic anthems as “S Wonderful,” “Someone to Watch Over Me,” and “I Got Rhythm.” Like Cole Porter, another great popular composer of the time, Gershwin benefited from the use of his tunes in movie musicals of the 1930s, most memorably those starring dance duo Fred Astaire and Ginger Rogers. Such exposure led to national recognition. In the 1930s, Gershwin moved into political satire and spoofs with such comedies such as *Strike Up the Band* (1930) and George S. Kaufman's *Of Thee I Sing* (1931), which won the Pulitzer Prize.

Along with popular music, Gershwin began experimenting with classical symphonic works in the 1920s. At the request of band leader Paul Whiteman, in 1924 he

wrote his now-famous *Rhapsody in Blue*, a piece for piano and jazz band, scored by American composer Ferde Grofé. Gershwin composed a longer piece, *Concerto in F*, for piano and orchestra in 1925. His symphonic poem, *An American in Paris*, written in 1928, was rhythmically and harmonically challenging. In 1935, Gershwin completed *Porgy and Bess*, an opera based on DuBose Heyward's book about life on Catfish Row in Charleston, South Carolina. Using African-American themes and jazz and blues rhythms in classical forms, the opera reached popular audiences with its evocative and haunting music, especially the memorable song, "Summertime." On July 11, 1937, at the age of 38, Gershwin died in Beverly Hills, California. His music remains a vital part of the popular music repertoire in the United States and internationally.

**Gilman, Charlotte Perkins** (1860–1935) *feminist theorist and writer*

One of the most creative social thinkers of the Progressive Era, socialist feminist Charlotte Perkins Gilman wrote extensively in journals and magazines and authored several important books, including her first major work, *Women and Economics* (1898). Born into a well-known family in Providence, Rhode Island, Gilman's childhood abruptly changed after her mother and father separated. She grew up in genteel poverty. She attended Rhode Island School of Design for a few years and then worked as a teacher and commercial artist. After she married artist Charles Stetson, she grew increasingly unhappy. Her depression only increased after the birth of a daughter, Katherine. After undergoing unsuccessful psychological treatment, an episode she later dramatized in the short story, "The Yellow Wallpaper," Gilman divorced her husband and sent her daughter to live with him. She chose to live independently, supporting herself with journalism, fiction, and public speaking. In 1900, at age 40, she married George Houghton Gilman, a cousin who was more accepting of her public career. They remained married until his death in 1934.

Gilman's career took off with the publication of *Women and Economics* in 1898. Heavily influenced by sociologist Lester Frank Ward, the study took on the challenge of analyzing women's status and work in society. In it, Gilman argued that women had been socially and emotionally disabled by their isolation in the home. Their absence from the public world of work devalued them in an increasingly materialist society. As a remedy, Gilman advocated that women enter the workforce and the profes-

sions. In subsequent books, she argued for revolutionary new arrangements for domestic life, including the creation of day nurseries and shared household work. *Women and Economics* was published and later translated in several editions in the United States and abroad. Less well known were her books *Concerning Children* (1900) and *The Home* (1903), which further explored collective housekeeping and childcare. *Human Work* (1904) offered a social Darwinist perspective on the social division of labor.

From 1909 to 1916, Gilman published the independent socialist journal, *The Forerunner*. In *The Forerunner*, she serialized a number of novels, including *Herland*. The utopian novel, which is now widely read as a socialist feminist work, imagined an isolated society organized along maternal lines. Three earnest young men, one a sociologist and the other two adventurers, discover a secluded mountain community of women. There, motherhood is the highest good, and all efforts are bent toward developing moral and cultural values in children and adults. As a satire, the novel targeted the relationship between the sexes of the day, in particular its disregard of women's productive and creative powers. Such neglect, Gilman suggested, rendered women helpless victims of men's egotism. For all its touting of female and maternal values and critique of masculine and patriarchal power, the novel implied that cooperation and the absence of "male" values had made Herland's society stagnant. The end of the novel foresaw a progressive integration of masculine and feminine values.

With the end of WORLD WAR I and the RED SCARE, feminism and socialism fell into disrepute. Old-fashioned women's rights advocates like Gilman fell out of favor. The growing popularity of SIGMUND FREUD's sexual theories changed socialism, but Gilman stayed her own course to the end and continued to advocate social evolutionary ideas. Her autobiography, *The Living of Charlotte Perkins Gilman* (1935), gave testimony to the importance of women's individual emancipation within the framework of progressive social reform. Gilman died in 1935, having contracted breast cancer and taken her own life.

**Goldman, Emma** (1869–1940) *anarchist leader, activist*

One of the most famous radicals of the 20th century, anarchist Emma Goldman promoted the causes of labor, free love, free speech, and revolution throughout her life. She was born on June 27, 1869, in Russian Kovno (now Kaunas, Lithuania), to Abraham and Taube Bienowitch Goldman. Financial difficulties prompted the family to move to

Königsberg in Prussia, where Emma attended school for three and a half years. In 1881, the family moved to Saint Petersburg, Russia.

The political repression following the assassination of Czar Alexander II outraged Goldman, who was already sensitized to injustice by Russian anti-Semitism and the brutality of her own father. Participation in underground discussion groups exposed her to radical literature, which she eagerly absorbed. Her political activities and sexual adventures, however, increased turmoil at home, which she escaped by migrating to America with her half-sister, Helena, in 1885.

The events surrounding the Haymarket Riot in 1886 rekindled her interest in radical literature. She soon became an avid reader of *Die Freiheit*, an anarchist newspaper published by Johann Most. She was intrigued by his support of violence and his emphasis on the individual, rather than the state. In 1889 she moved to New York, where she met Most. He quickly became her mentor and lover. Under his direction, she embarked on a lecture tour, speaking in Yiddish to immigrant audiences.

Emma Goldman, 1934 (Library of Congress)

As Goldman's relationship with Most cooled, she became involved with Alexander Berkman, another anarchist. Berkman, incensed by the Homestead Strike, decided to assassinate Henry C. Frick. Goldman endorsed the plan and helped raise money to purchase a revolver and a new suit so her lover could gain access to Frick's office. Berkman only wounded Frick, but he received a 20-year prison sentence. Her role in the plot undiscovered, Goldman publicly defended her lover, declaring that the use of violence is justified when one is pushed to extremes by injustice. Her argument enraged most people. Indeed, public harassment was so great that, for a time, she could find lodging only in a brothel.

Although neither she nor Berkman acknowledged her role in the assassination plot, she was a target for police surveillance. At a speech to the unemployed, she was arrested for inciting to riot, found guilty, and sentenced to one year in prison. While in jail she served as an assistant to the prison's physician and became fluent in English.

Upon her release, she worked for a while as a practical nurse and midwife in the slums of New York, an experience that convinced her of the necessity for BIRTH CONTROL. In 1895 she traveled to Europe where she took the nursing course at the Allgemeines Krankenhaus in Vienna, Austria. While there she attended lectures by Sigmund Freud that clarified her ideas on sexuality. She then returned to the United States, where she became notorious for expounding such radical ideas as anarchy, free love, and birth control.

Goldman was best known for her activism after 1910. On her lecture tours, she spoke on topics that ranged from modern drama, anarchist philosophy, free love, and women's emancipation to the evils of capitalism. From 1906 to 1917, she published a monthly journal, *Mother Earth*, which incorporated a similar mix of culture and anarchist thought. During WORLD WAR I, both Goldman and Berkman were arrested for counseling young men to resist the draft. After serving in prison for two years, they were both deported as radicals to Soviet Russia during the RED SCARE. Critical of the Bolshevik government, Goldman left the Soviet Union to spend the last 20 years of her life in exile from the United States, which she had long regarded as her home. She published her two-volume autobiography, *Living My Life*, in 1931 and died in Toronto in 1940. She is buried in Waldheim Cemetery in Chicago.

—Harold W. Aurand

**Goldmark, Josephine Clara** (1877–1950) *social worker*

Known for her social investigations into industrial hygiene, fatigue, child labor, and education, Josephine Goldmark

was born on October 13, 1877, the daughter of Joseph and Regina Goldmark. Born in Poland, her father went to school in Hungary and pursued his medical education at the University of Vienna, where he became involved in the political ferment of 1848. Immigrating to the United States, Joseph Goldmark became a doctor. Doing chemical research in explosives, he took out patents on safety caps and cartridges. The Union Army in the Civil War used his inventions extensively. He died in 1881, when Josephine was three. Josephine grew up in a political household. Her older sister Helen married Felix Adler, of the Society for Ethical Culture, who acted as surrogate father for Josephine. Her sister Alice married LOUIS D. BRANDEIS, who eventually became a Supreme Court justice.

Josephine went to private school and then Bryn Mawr College. Graduating in 1898, she undertook graduate work at Barnard. She was working there as a tutor in 1903 when she met FLORENCE KELLEY of the National Consumers League (NCL). The NCL was a national organization that served as a watchdog on working conditions in the United States. It lobbied for protective labor legislation, including maximum hour and minimum wage laws, and for state and federal laws prohibiting or regulating child labor. It also gave its resources to defend protective labor laws against court challenges.

Hired as Kelley's assistant at the league, Goldmark wrote several publications, including *Child Labor Legislation Handbook* (1907). Her most important work for the league, however, was to compile the massive social data her brother-in-law Louis Brandeis used in several of his most important cases, including *MULLER V. OREGON* (1908). In that landmark case, the Supreme Court decided in favor of Brandeis. Arguing for the rights of states to limit women's working hours because of the state's interest in protecting the health of mothers and children, Brandeis had argued that long hours and fatigue endangered women's health and, what was more, eroded their efficiency as workers. Goldmark later compiled her research on work in the book, *Fatigue and Efficiency: A Study in Industry* (1912). The product of five years of research, the study made an eloquent case for progressive social legislation. Goldmark used social statistics from American and European health officers and factory inspectors, labor bureaus and investigative commissions, to demonstrate that long hours not only eroded workers' health but also undermined their productivity. On the strength of her growing reputation, Goldmark was appointed to serve on the committee investigating the TRIANGLE SHIRTWAIST FIRE (1911).

Later in her career, Goldmark became involved in surveying and improving nursing education. Serving on the Rockefeller Foundation's Committee for the Study of Nursing Education, Goldmark contributed to its 1923 report, *Nursing and Nursing Education in the United*

*States*. The committee's recommendations for higher standards in nursing education and more academic training led to the founding of nursing schools at Yale, Vanderbilt, and Case Western Reserve. Nursing schools also developed new university affiliations. Goldmark pursued her interests in public health and hygiene through the rest of her career. She died in 1950.

## Great Migration

From WORLD WAR I through the 1920s, over a million African Americans migrated from the South to northern industrial cities. Known as the Great Migration, their movement marked a crucial transition in the history of African Americans, cities, and the working class. The causes of the migration were complex and involved factors that pushed the migrants out of the South and others that attracted them to the North. It is important to remember, however, that at the base of the migration were millions of individual African Americans who decided that their hopes for full citizenship lay in the northern cities.

African Americans had been migrating since the end of the Civil War in their search for independence. Traditionally they sought freedom from white control through land ownership, moving anywhere that whites did not restrict their actions and rights. By the 20th century, with the enactment of SEGREGATION laws throughout the South and efforts by whites to control African-American labor, dreams of independence through land ownership were fleeting. Many farmers who did own their own land were at the mercy of white-owned banks and businesses to which they owed money. When hard times hit, African-American farmers who were already living on the edge of subsistence found it increasingly difficult to make ends meet. Many were forced to sell their farms at discounted prices in order to pay off their debts. The African-American farmers were hit particularly hard when the cotton crops were destroyed by the boll weevil in the first decade of the century.

Farmers forced off the land had few choices about where to work. They could join other African Americans who already farmed as sharecroppers and tenant farmers, or they could move to southern cities. Sharecropping and tenant farming were uncertain ways of making a living

Men shoveling snow onto a wagon after a storm, Washington, D.C., ca. 1915 (*Library of Congress*)

from farming. In both, African-American farmers rented land from white landowners. In sharecropping they paid their rent with a share of the crop produced, while in tenant farming they paid their rent through cash payments. In the case of many small farmers, the value of their crops never exceeded their rent, so every year they fell further and further into debt. The process forced them to remain on the same farm because local laws made it illegal to move if one owed a debt. Those African Americans who lived in southern cities faced similar restrictions on their actions. Only the jobs lowest on the occupational hierarchy were available to them.

In addition to their economic plight, African Americans living in the South suffered from legal, physical, and social exploitation. The denial of voting rights was at the center of the efforts by southern whites to exert control

over African Americans. After Reconstruction ended, white-controlled state legislatures disenfranchised African-American voters throughout the South. Whites also created a segregated social order determined by a strict set of racial protocols. Separate facilities for whites and African Americans were created. Individual relationships were determined by these racial customs based on the subservience of African Americans to whites at all times. If African Americans overstepped social boundaries, they often faced a violent backlash. Whites used lynching to punish African Americans who overstepped racial bounds.

It was not until changes occurred in the industrial North that large numbers of African Americans seized the opportunity to migrate. Blacks in the North had experienced many of the same restrictions on their occupational choices prior to World War I. They were relegated

to domestic services or to work as laborers. Higher paying industrial jobs were closed to them. This changed during the war. Immigration from Europe, one of the major sources of industrial labor, slowed to a trickle. Whereas a few years earlier approximately one million immigrants annually entered the United States, the flow slowed to around 100,000 each year during the war. In addition, when America entered the war, many white workers left their jobs to join the Armed Forces. Without a labor supply from abroad, American industrial corporations began to hire African Americans for the first time. These new economic opportunities were integral to the decisions of many African Americans to migrate North.

Many southern African Americans learned of the new opportunities from friends, relatives, and neighbors who had traveled north. Some migrants remember their communities being struck with migration fever, as they called it. As more people migrated, the news spread, which served to attract more migrants. Pullman car porters and other African-American railroad workers made up another network communicating the news. Many of these men lived in Chicago, and spread the news as they traveled from town to town. They also played another significant role by distributing African-American newspapers, such as the *Chicago Defender*. The papers served as militant voices for black aspirations. Many migrants drew their images of life in the urban North from the pages of these newspapers.

Despite reports of migrant fever, most African Americans undertook the migration with a great deal of planning. They sought out information about their destinations, and many patiently waited for their chance by saving up enough money to make the trip. Many of those living in the Deep South made the migration in steps, moving first to a nearby city and then city by city until they reached their final destination. This way they earned enough money at each step to continue to the next one.

Upon reaching their destination, migrants found an environment that provided them with new possibilities but fell far short of full citizenship and personal independence. The jobs in Chicago's meat-packing houses and Pittsburgh's steel mills that had lured many North paid two to three times what African Americans could earn in the South. There was little chance, however, for promotion beyond entry-level positions. Schools were almost incomparably better than those provided for African Americans in the South, but even with a high school education, many graduates faced difficulty finding a job that afforded them a chance to use their skills. Migrants soon realized that the right to vote did not automatically give them political power. They also found that they faced discrimination in housing. African Americans were forced to live in segregated areas of the cities. This segregation was imposed in many ways. Realtors and landowners refused to rent or sell property

to African Americans in certain sections of cities. In addition, whites often physically attacked African Americans who moved outside the prescribed boundaries. With their choices restricted, African Americans were forced to live in areas that became defined by overcrowding and high rents. African Americans also faced racial violence in northern cities. In East St. Louis in 1917 and Chicago in 1919, to name two examples, race riots occurred that left 39 African Americans dead in St. Louis and 23 in Chicago.

Despite all these restrictions, African Americans managed to create vibrant urban communities that played significant roles in America's cultural history. Without the migration to the North, for example, BLUES music would never have made the contribution that it has. Only by gaining access to urban audiences and the RADIO could blues musicians popularize their work. Other contributions in literature, art, and music such as the HARLEM RENAISSANCE grew directly out of the urban communities created by the Great Migration.

The Great Migration thus marked a crucial transition in the history of America. For African Americans, it marked the end of their reliance on agricultural independence as the means for gaining full citizenship and shifted the center of African-American population to the northern cities. The African-American communities became the driving force in the freedom struggles. The migration also reshaped the political, social, economic, and demographic landscapes of America's cities. Finally, the migration reshaped the history of the American working class as African Americans entered the industrial workforce in large numbers for the first time.

### Great White Fleet (1907–1909)

President THEODORE ROOSEVELT often said that the United States needed to “Speak softly and carry a big stick.” While Roosevelt on several occasions used the American military to directly intervene in Caribbean and Latin American nations, he approached foreign policy issues in a very different way when it came to Asia. Competing with European nations in that sphere, his policy was more nuanced. Indeed, in 1907 Roosevelt ordered the main part of the U.S. Navy's fleet, the so-called Great White Fleet, which

included 16 battleships, to embark on a 45,000-mile world tour. He hoped that the show, rather than the use, of American seapower would preserve American interests in Asia.

In Asia, Roosevelt's main foreign policy objective was to maintain the OPEN DOOR POLICY in China. He also was concerned about maintaining the balance of power that existed in East Asia. The chief threats to the balance of power in the region came from Russia and Japan, both of which wanted to control a greater share of China. In 1904, these two nations—Russia and Japan—had gone to war with each other as they were attempting to build a stronger sphere of influence in Asia. For the most part, President Roosevelt supported Japan's efforts to obtain world-power status, which he recognized could not be prevented. He thought, however, that such status could be obtained through peaceful means, rather than war and conflict.

Accordingly, with the outbreak of the RUSSO-JAPANESE WAR, President Roosevelt initiated secret negotiations to arrange a peace. These efforts to negotiate an end to this conflict resulted in Roosevelt's winning of the Nobel Prize for Peace in 1906, the first American to earn that award. Roosevelt's goal in supporting the Japanese was to allow them to secure a sphere of influence in East Asia (similar to what Roosevelt had done in Central America, the Caribbean, and Latin America), and second, to secure a tighter link between Japan and the United States. While Roosevelt sought to build a lasting relationship with Japan, his efforts were frustrated by the anti-Asian nativism rampant in the United States in the early part of the 20th century. This controversy was particularly played out in California where the state legislature debated laws to bar further Japanese immigration and local school boards ordered the segregation of Asian schoolchildren so that they would not "contaminate" white children. The so-called Yellow Peril caused outrage in Japan, and pro-military elements within the Tokyo government began calling for a possible war with the United States. To calm this growing sentiment, President Roosevelt put aside his own racist tendencies to find a solution to this growing controversy. Roosevelt's GENTLEMEN'S AGREEMENT with Japan in 1907 resolved the mounting tension between the two nations as Japan agreed to halt immigration to the United States and the San Francisco school board agreed to rescind its segregation order.

Fearing that he would be attacked for appeasing the Japanese, President Roosevelt subsequently ordered the Great White Fleet on its world tour late in the year. The fleet would make many stops across the globe, but perhaps most significantly, it made an appearance in Tokyo Bay. While many in the United States, including members of Congress, feared that this show of American military strength might rekindle the militarist sentiment in Japan, Japan instead responded in a calm fashion that emphasized its recognition of American military strength. President

Roosevelt demonstrated skill in his dealings with Japan. His policies are credited with staving off direct conflict with Japan while at the same time preserving a strong United States presence in East Asia.

## Greenwich Village

Greenwich Village is a neighborhood on the lower west side of Manhattan. Bounded on the east by Washington Square and Fifth Avenue, it is marked on the west by the Hudson River, and on the south and north by Houston Street and Tenth Street. At the turn of the century, the Village, as insiders know it, was home to both working-class immigrants and young middle-class professionals, who were looking for inexpensive housing in New York City. Soon, however, Greenwich Village became nationally known for its bohemian atmosphere and modern ways. Artists, actors, journalists, writers, labor organizers, and radicals patronized its cafés and participated in its street life. Anarchists and suffragists were found drinking coffee and arguing about the revolution. A center of modernist art and culture, the Village became the place where young talent migrated and flourished. Surrounded by the cosmopolitan influences of European immigrant radicals and intellectuals, a new generation of writers and activists challenged the relations between the sexes, class inequality, and the cultural establishment. Through their art and politics, they sought to refashion American identity in the modern mode.

During this period, the core group of intellectuals and artists identified with Greenwich Village were those associated with the journal, *THE MASSES*. Edited by Max Eastman, *The Masses* published work from radical thinkers and writers such as JOHN REED, Floyd Dell, and MARY HEATON VORSE. Its sheer range dazzled readers, for in any issue could be found articles on the class struggle, art criticism, feminism, and birth control. Having broken with the narrow legacy of the Left, *The Masses* writers connected sexual equality with the class struggle, art with politics. These same writers crossed class lines to support the LAWRENCE STRIKE of 1912 and the PATERSON STRIKE of 1913 and allied themselves with the INDUSTRIAL WORKERS OF THE WORLD (IWW). From this group as well came support for MODERNISM IN ART. John Sloan, one of the primary figures in the ASHCAN SCHOOL and a contributor to the ARMORY SHOW of 1913, also engaged in strike support. His wife, Dolly, helped organize the children's exodus during the Lawrence Strike. Among those in the Village were the core of the Provincetown Players, an experimental theater group

that fostered the talents of playwrights Susan Glaspell and Eugene O'Neill. Writers Hutchins Hapgood, Neith Boyce, Mary Heaton Vorse, Jack Reed, and Louise Bryant participated in the Provincetown plays.

For the Greenwich Village intellectuals as well as for the labor movement, the central issue of the day was free speech. The crisis of culture at the turn of the century put civil liberties and, indirectly, the role of the state into relief. The Comstock Laws, passed in 1873 to outlaw the mailing of printed matter judged obscene, including information on contraception, silenced the press and kept many literary works under wraps. Vigilante violence and civil ordinances prohibiting political meetings, used against unions in many locales, called into question the role of the state in suppressing dissent. When the Wilson administration during WORLD WAR I further regulated newspapers, books, and speeches under the TRADING WITH THE ENEMY ACT and ESPIONAGE ACT government interference became an immediate threat. Greenwich Village was the center of this maelstrom, as many of its residents—including anarchist EMMA GOLDMAN, birth control advocate MARGARET SANGER, and Margaret Anderson, editor of the *Little Review*, and *The Masses* group itself—were subjected to arrest under various censorship laws.

The influence of Greenwich Village went far beyond the bounds of New York. While modernist artists and writers could be found in artist colonies in San Francisco, Chicago, and Taos, New Mexico, Greenwich Village became the national center of modern culture. It also became a Mecca for independent book publishers and radical literary magazines and political journals. Along with *The Masses*, the *Little Review*, *Seven Arts*, Sanger's *Woman Rebel* and Goldman's *Mother Earth* had their editorial offices in Greenwich Village. With an eclectic range and respect for diverse cultures and ideas, the Village helped to foster modern American art and LITERATURE. Yet the Village's reputation for bohemianism remained one of its lasting legacies. By the 1920s, it had become a stop for both city newcomers and tourists curious to see the place where modern art flourished, the NEW WOMAN walked, radicals spoke on street corners, and free love reigned.

**Griffith, David Wark (D. W. Griffith)** (1875–1948)  
director, writer, producer

D. W. Griffith, the celebrated director and producer, was born in 1875 in Kentucky. Being born in the South during

the Reconstruction era had a profound impact on his life-and art. Equally influential was Griffith's father. Best known as Colonel "Roaring Jake" Griffith, he had been a Confederate cavalry officer during the Civil War. His vision of American society had a profound influence on his son. This influence would appear in a number of D. W. Griffith's productions.

Griffith was first introduced to the motion picture industry in 1907 when he played the hero's father in Edwin S. Porter's *Rescued from an Eagle's Nest*. Griffith had no intention of embarking upon a career as an actor. He envisioned himself as a playwright. To save his name for the stage, he acted under the alias Lawrence Griffith. His dreams of a career as a playwright proved illusive. He produced only one play, and it was a flop. Success in the emerging motion picture industry came much easier. Griffith's career as an actor soon provided him with the opportunity to write and direct. He learned that, while he could earn only \$5 a day as an actor, he could receive \$10 to \$15 for story ideas. In 1908 he directed his first film, *The Adventures of Dollie*.

Griffith's most important insight was that the shot, and not the scene, was the basic unit of film language. He moved the camera up close to gain a level of intimacy that was previously unknown. He integrated the close-up with the medium shot and the distant scene to tell a more complete and intimate story. He also challenged the idea that motion pictures needed to be short. In 1913 he completed *Judith of Bethulia*. The four reel-long film was twice as long as any picture he had previously released. He wanted to produce even longer films, but his employer, the American Biograph Company, was hesitant to finance the production of larger film projects. As a result, Griffith left the firm.

After joining a small independent company called Mutual, Griffith directed a number of routine productions. At that point, he produced his classic film, *BIRTH OF A NATION*. *Birth of a Nation* transformed the motion picture industry. It was longer and more costly than any project previously attempted in the United States. In 1915 it opened as *The Clansman* in Los Angeles and later as *Birth of a Nation* in New York. The change of name was suggested by Thomas Dixon, author of the racist novel on which the movie was based, who wanted the film to symbolize not only the rise of the KU KLUX KLAN but also the development of America.

*Birth* attempted to tell a story of the Civil War and Reconstruction. The scale and scope of the movie were enough to make the release a noteworthy event, but *Birth of a Nation* was far more than just the first full-length American feature film. It was a cultural event of tremendous proportion. The movie defined American history in such a way that it caused celebration in some cities and rioting in others. Aware of the impact that the film would likely have, Griffith took out a number of the more objectionable

D. W. Griffith on location of a film shoot, 1923 (Library of Congress)

scenes. The film's premise, that the Reconstruction era was a time of fraud and revenge, was based upon the assumption that blacks were inferior. It also portrayed the Ku Klux Klan as a just organization, dedicated to saving the South.

The reception that *Birth of a Nation* received was unprecedented. The movie's message was even brought before the Senate. In an attempt to challenge those who had attacked his work, Griffith published the pamphlet, "The Rise and Fall of Free Speech in America." He thought that attacks upon him and his movie should be viewed as assaults on freedom of speech and expression. He believed that it was his obligation to defend not only himself, but the right of free speech. His next work, *Intolerance*, was an attempt to launch this crusade.

After *Birth* was completed, Griffith produced *The Mother and the Law*. Its opening sequences were based on an incident of conflict and violence in the American labor movement. The movie was a sound piece of work; but in the shadow of *Birth*, it was a disappointment. Griffith decided to make the movie into something more ambitious. To do so, he added three other stories to *The Mother and the Law* to make one grand movie, *Intolerance*. The film presented Griffith's

vision of a historical battle against ignorance and intolerance. To finance the undertaking Griffith spent all of the proceeds from *Birth* and was even forced to buy out his fellow backers. The picture cost \$1.9 million. The movie ran for nearly four hours. After being released in Los Angeles and New York to disappointing audiences, Griffith began a long series of edits. Even after the edits, the film was not well received. Desperate for money, Griffith divided the work into two films, *The Mother and the Law* and *The Fall of Babylon*.

After *Intolerance*, Griffith directed a number of other movies. In 1919 he released *Broken Blossoms*, the next year he made *Way Down East*, and two years later he released *Orphans of the Storm*. All were of considerable skill and charm, but they paled in comparison to his two great epics. Griffith will be known best for his production of *Birth of a Nation*.

**Hamilton, Alice** (1869–1970) *physician, industrial health advocate*

One of the foremost proponents of OCCUPATIONAL HEALTH AND SAFETY and an expert in industrial toxicology, Alice Hamilton was born in Fort Wayne, Indiana, in 1869, the daughter of Montgomery and Gertrude Pond Hamilton. Hamilton graduated from the University of Michigan Medical School in 1893. She served medical internships in Minneapolis and Boston and studied bacteriology at the University of Leipzig and Munich and at Johns Hopkins Medical School. In 1897, she took a position teaching pathology at the Woman's Medical School of Northwestern University in Chicago.

While in Chicago, Hamilton became a resident of Hull-House. She soon immersed herself in the study of industrial medicine, or the study of occupational disease and injury, in the lives of immigrant workers in the Hull-House community. The dangers of the workplace were everywhere in evidence as injured workers and the widows and orphans of workers killed on the job were among the poorest residents of the neighborhood. Hamilton studied the problem through the existing European literature on the subject, since it was largely ignored at American medical schools. In 1908, she published her first article on occupational health. By 1910 she had become a recognized expert, employed by various state and federal health committees. Her investigations into industrial poisoning in the lead, rubber, and munitions industries and the connection between the use of lead, rayon, and nitrate in manufacturing and their serious side effects of loss of vision, paralysis, and death led to WORKER'S COMPENSATION laws.

In 1919 Hamilton was hired as an assistant professor of industrial medicine and the first woman faculty member at Harvard Medical School. While she was discriminated against as a woman at the university, she also was pursued by national and international organizations concerned with industrial disease. Hamilton served as a member of the League of Nations Health Committee and as a consultant

to the U.S. Division of Labor Standards. Her research supported the movement for greater workplace regulation and the protection of workers, especially child workers, from the hazards of industry. Her role in the case of women dial painters called attention to the dangers of radium in manufacturing. Her books, *Industrial Poisons in the United States* (1925) and *Industrial Toxicology* (1934), became the standard texts in the field.

In addition to her work on occupational disease, Alice Hamilton continued to play a role in labor reform in the NATIONAL WOMEN'S TRADE UNION LEAGUE, the NATIONAL CONSUMERS LEAGUE, and in the PEACE MOVEMENT. She was one of the founders of the Woman's Peace Party in 1915, along with her Hull-House associates JANE ADDAMS, GRACE ABBOTT, and FLORENCE KELLEY, and woman suffragists CARRIE CHAPMAN CATT and JEANNETTE RANKIN. Hamilton also participated in the founding of the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM and as a member of the FELLOWSHIP OF RECONCILIATION and the AMERICAN CIVIL LIBERTIES UNION. Hamilton continued her political activism on the behalf of workers, women, and peace throughout her life. She died at the age of 101 in 1970.

**Harding, Warren Gamaliel** (1865–1923) *president of the United States*

Born in 1865, in Blooming Grove, Ohio, Warren Harding was the son of George and Phoebe Dickerson Harding. Warren attended school and then Ohio Central College. In 1882, the family moved to Marion, Ohio, where Warren

studied law and sold insurance. He also taught school. After working a stint for the *Caledonia Argus*, he took a job as a printer and reporter for the Marion *Democratic Mirror*. He seized an opportunity in 1884 to buy out a small local newspaper, the Marion *Star*. In 1891, Harding married Florence Kling De Wolfe, a widow. Harding invested her money in the weekly *Star* and made it a success.

As his newspaper flourished, Harding developed a strong interest in public affairs. He joined the state Republican Party and served in the Ohio State Senate from 1898 to 1902. In 1903, with the help of his friend, lawyer Harry Daugherty, Harding was elected lieutenant governor. After a brief retreat from public life, Harding ran for the U.S. Senate in 1914. He won the election by a large margin. In the Senate, he supported a high protective tariff, supported the U.S. entry into WORLD WAR I, opposed high taxes, and voted against American participation in the LEAGUE OF NATIONS. Having served only one term in the Senate, Harding won the Republican nomination for president. Unlike more recent presidential candidates, he maintained his distance from newspaper reporters throughout the campaign.

Warren G. Harding (Library of Congress)

Protected by the media's acceptance of public officials' right to privacy, Harding had a tumultuous personal life. Not only had he married Florence De Wolfe, a woman who had been divorced and bore a child out of wedlock, but Harding also was known in the language of the time as a "womanizer." Long-term affairs with a family friend and a younger woman surfaced after his death, as did reports of other liaisons. At the same time, Harding's public persona was almost that of a grandfather figure. His white mane and patrician good looks seemed assurance of his moral standing and personal responsibility.

During the 1920 campaign, Harding ran on a platform of a return to "normalcy." Normalcy signified, in the words of editor William Allen White, that Americans were "tired of the issues, sick at heart of ideals, and weary of being noble." Throughout the campaign, Harding played the role of an elder statesman. He had, in fact, an undistinguished senatorial career. Yet his profile was likened to that of a Roman senator, and he enjoyed posing for reporters. Harding barely left his hometown during the presidential campaign. Instead, he spoke from his front porch, allowing his ornate speech to carry the day. His language revealed that he was a consummate politician of the old school. Writer H. L. MENCKEN said that Harding's political speech was like "a string of wet sponges. . . . It is rumble and bumble. It is flap and doodle. It is balder and dash. . . . It is so bad that a kind of grandeur creeps into it." In one famous speech, Harding proclaimed that, "America's present need is not heroics but healing . . . not agitation, but adjustment. . . . not the dramatic, but the dispassionate. . . . not submergence in internationality, but sustainment in triumphant nationality." The speech captured the core of the campaign. Voters were asked to abandon the reforming impulse of PROGRESSIVISM and attend to business.

Defeating DEMOCRATIC PARTY candidate James Cox by an overwhelming margin of 16 million votes to 9 million, Harding became the 29th president of the United States. For those in the Republican administration, Harding's election expressed a public desire for normalcy. The majority of voters believed that the government should cut back and limit its functions but also wanted it to address the social and economic disorder of the war years. The foremost example of this impulse was the passage of the BUDGET AND ACCOUNTING ACT (1921) in Harding's first year as president. It set up the structure for the federal budget system by creating the Budget Bureau in the executive branch. Before its passage, government allocations were haphazard, divided among different pieces of legislation, with no overall plan or intended balance. With the creation of the Budget Office under its original head, CHARLES GATES DAWES, the U.S. government was to develop an overall budget plan that limited deficits such as those accumulated during World War I and began to pay

off federal debts. Over the course of the 1920s, even with new expenditures to enlarge the Commerce Department and the VETERANS BUREAU and the loss of revenue from tax cuts, the national debt declined from \$25.5 billion in 1919 to \$16.9 billion in 1929.

Harding's administration was committed to other programs that would return the country to normalcy. Seeking to disentangle the United States from foreign involvement, Harding encouraged arms reduction negotiations that culminated in the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT in 1921–22. He also signed peace treaties with Germany, Austria, and Turkey. In agriculture, his administration supported moderate measures to address the farm crisis through the CAPPER-VOLSTEAD ACT. And in the area of labor relations, Harding pushed for and held an unemployment conference. At the same time, many workers held his administration personally responsible for the loss of the RAILROAD SHOPMEN'S STRIKE of 1922 and the blows dealt to labor as employers filed repeated strike injunctions.

Despite the trend toward more rational government, Harding's administration revealed a talent for habits of patronage and corruption. In the first year of Harding's term, post office positions, which had been given over to civil service, were reclaimed as political appointments. Harding also appointed a number of his old political cronies from "the Ohio gang" to major cabinet offices. Dependent on the advice and aid of his political network, Harding found many of his political appointees entangled in massive graft, bribery, and corruption. His selection of Harry Daugherty as attorney general, Charles Forbes as director of the Veterans Bureau, and Albert Fall as secretary of the interior opened the door to major scandals in government. Daugherty's appointments to the Prohibition Bureau led to widespread corruption among its agents, and he was implicated in other scandals. Forbes was convicted of having stolen more than \$33 million from the Veterans Bureau in fraudulent land deals and purchasing schemes. As secretary of the interior, Albert Fall was responsible for the illegal leasing of naval oil reserves to oil industry magnates Harry Sinclair and Edward Doheny in what became known as TEAPOT DOME. Investigations of the Veterans Bureau and Teapot Dome were just under way in 1923, but they led to the indictment and conviction of some of the major officers of Harding's administration.

On a trip to Alaska and California in 1923, Warren G. Harding died suddenly as a result of poor medical treatment and a heart attack. He was buried quickly and without an autopsy, a fact that engaged the public imagination for years. Harding's administration, then under investigation, was in chaos. As his chief defender, his widow Florence Harding saw to it that many of his papers were burned. That act cast permanent doubt about Harding's culpabil-

ity in the scandals and about the cause of his death. CALVIN COOLIDGE, nicknamed "Silent Cal," succeeded to the presidency after Harding's death, but his distance from Harding's administration saved the REPUBLICAN PARTY from repercussions of the scandals.

The legacy of the Harding administration is hard to assess. His unexpected death in 1923 shortened his term in office and kept him from fulfilling his ambitious program of conservative retrenchment. Harding's successor, Coolidge, became even more committed to a business-oriented government. He was, as journalist Walter Lippmann wrote, "a frugal little man who in his personal life is the very antithesis of the flamboyant ideal that everybody is frantically pursuing." Although he had a much quieter presence than Harding, Coolidge followed up on many of his political promises. Peace and prosperity, the two bywords of the Harding era, were the hallmark of Coolidge's presidency as well.

Sferrazza, *Florence Harding: The First Lady, the Jazz Age, and the Death of America's Most Scandalous President* (New York: William Morrow, 1998).

## Harlem Renaissance

One of the most important cultural movements of the 20th century, the Harlem Renaissance was a movement in LITERATURE, MUSIC, ART, and performance that celebrated the African-American heritage and revitalized American arts through its incorporation of African traditions and themes. Reaching its peak in the years between 1923 and 1929, the movement fostered an emerging generation of African-American writers, musicians, and composers and formed the center of a more general cultural revival centered in New York City. National in scope, this explosion of creativity was not so much a rebirth of African-American cultural expression as its integration into modern literature and art. For most of the 19th century, African-American music and literature had been excluded from mainstream culture. Beginning in the 1920s, audiences across the racial divide were given new access to the mythology, language, and musical traditions of African Americans.

The Harlem Renaissance was the product of the social movement of African Americans from the rural South to northern cities in the GREAT MIGRATION. Southern migrants brought with them musical forms derived from gospel and secular songs and helped to create new genres of JAZZ and urban BLUES. New migration from the West Indies to New York in particular introduced new African and West Indian elements into the mix. The growth of Harlem set the stage

Langston Hughes (Library of Congress)

for a cultural revival among African Americans and the diffusion of their ideas to a national stage.

Revitalized political organizations also furthered the cultural revival. First, the creation of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP) brought African Americans and white supporters into a coalition to protest discrimination and open the door for expanded civil rights. Their political coalition became a cultural one, as white patrons of African-American education and art supported new cultural institutions and individual careers. Second, the NAACP, the Urban League, and the UNIVERSAL NEGRO IMPROVEMENT ASSOCIATION (UNIA) under leader MARCUS GARVEY fueled social and cultural activism in African-American communities. The UNIA also contributed to the spread of race pride and fostering of African-American traditions. Finally, the publication of new journals, including the NAACP's *Crisis*, the Urban League's *Opportunity*, and the Brotherhood of Sleeping Car Porters' *Messenger*, opened up new venues of publication for literature, criticism, and communication. Literary editor Jessie Fauset of the *Crisis* played a significant role in sponsoring new authors.

African-American novels, plays, and art proliferated with the spread of black journals and newspapers and a growing white audience and white patronage for African-American artists. ALAIN LOCKE captured this ferment in his 1925 book, *The New Negro*. Among the writers associated with this cultural flowering were Langston Hughes, Jean Toomer, Countee Cullen, Claude McKay, Nella Larsen, and Zora Neale Hurston. Hughes in particular became the voice of the black community, moving from cultural modernism in the 1920s to sharper social and political critique in his later work. All of the writers shared the concern of defining African-American identity as dualistic, a product of both African and American experience. They came to explore the dimensions of racial life and consciousness in Toomer's *Cane* (1923), Alain Locke's *The New Negro* (1925), Larsen's *Passing* (1929), and Hughes's *Weary Blues* (1925) and *Not without Laughter* (1930).

Visual artists were an important part of the Renaissance. For the first time, numbers of African-American artists attended art schools, often with the support of white patrons. Painters Aaron Douglas, Palmer Hayden, Malven Johnson, William H. Johnson, and sculptor Augusta Savage developed artistic styles that incorporated African elements with European techniques. Musicians and composers of blues and jazz similarly developed styles that incorporated the diverse elements of African-American and popular American culture into a music of growing popularity. In recordings that crossed race lines, African-American music reached white audiences as well as African-American ones. Their influence was seen in the work of white composers, songwriters, and musicians who adopted elements of jazz into their work.

Unlike the white counterparts of the LOST GENERATION to whom they might be compared, African-American writers and artists of the Harlem Renaissance neither repudiated religion as a formative and critical force in their culture, nor embraced a postwar pessimism about the future. Ironically, WORLD WAR I, which had been followed by severe racial conflicts, also opened the doors for African-American participation in American life in economic, cultural, and political terms. Rather than a lost generation, the Harlem Renaissance writers were a "found" one, newly discovered or recovered by the white cultural establishment. The influence of the Harlem Renaissance continued through the decade of the Great Depression.

**Haywood, William Dudley** (1869–1928) *labor organizer*

One of the major labor leaders of the early 20th century, Haywood was associated with the upsurge in labor militancy, first in the WESTERN FEDERATION OF MINERS (WFM) and later in the INDUSTRIAL WORKERS OF THE WORLD (IWW). An advocate of industrial unionism, he organized workers by industry and not by specific trade or occupation. Haywood was born in Salt Lake City, Utah, on February 4, 1869, as the son of a one-time Pony Express rider who died when Bill Haywood was three. He began work in the mines at 15, then married Nevada Jane Minor, the daughter of a rancher, and filed for and then lost a homestead claim. After returning to the mines, Haywood joined the WFM. His organizing skills brought him to the forefront of labor struggles in Idaho and Colorado, especially the violent Cripple Creek strike of 1904. In 1905, Haywood led the WFM into the newly formed Industrial Workers of the World, a militant labor organization. Like the WFM, the IWW advocated organizing the unorganized into industrial unions and stood in contrast to the trade unionist AMERICAN FEDERATION OF LABOR. Haywood opened the founding convention of the IWW in Chicago by proclaiming it “the Continental Congress of the working class.” A year later, the boisterously militant Haywood was accused of conspiracy in the 1905 murder of Frank Steunenberg, former governor of Idaho. Ably defended by CLARENCE DARROW, Haywood was tried and acquitted in a showcase trial.

Having left the WFM and the Socialist Party, Haywood became an organizer at large for the IWW and participated in some of the major strikes of his era. In the LAWRENCE STRIKE of 1912 and the PATERSON STRIKE of 1913, his persuasive oratory and personal skills helped to maintain worker unity and drew public support for the beleaguered strikers. For his role in these strikes, he earned the admiration of a new generation of intellectuals and radicals centered in GREENWICH VILLAGE, and the hostility of employers and government officials alike.

During WORLD WAR I, while Haywood cautioned against violating the ESPIONAGE ACT, he argued against the U.S. entry into the war. He advocated resistance to the military draft. For these reasons, he was arrested and jailed during the war. Despite the lack of evidence, Haywood was convicted and received a 20-year prison sentence. Awaiting a new trial, he fled the country on bail and went to the recently formed Soviet Union. He died there on May 18, 1928, and he is buried in the Kremlin Wall, alongside American communist JOHN REED.

Haywood was renowned as a speaker at labor rallies. As he once told ELIZABETH GURLEY FLYNN, words were tools and not every one had access to a full tool chest. He was, therefore, always straightforward in address and spoke at the level of his audience. A proponent of a particular kind of pragmatic unionism, he often counseled workers to use the leverage they had at the workplace, rather than to seek political power through the ballot box. Labeled a dangerous agitator, Haywood knew that the workers’ chief power was in limiting or stopping production. He repeatedly counseled against violence, despite his reputation as an advocate of worker sabotage. Calling for a broad-based unionism that went beyond skilled trade unions and brought in workers in every industry, he understood the importance of worker unity and the cost of divisions between workers, whether by ethnicity, race, skill, or gender.

**Further reading:** William Haywood, *Bill Haywood’s Book* (Westport, Conn.: Greenwood Press, 1983); J. Anthony Lukas, *Big Trouble; A Murder in a Small Western Town Sets Off a Struggle for the Soul of America* (New York: Simon & Schuster, 1997).

**Hearst, William Randolph** (1863–1951) *newspaper magnate*

William Randolph Hearst created the first American media empire by using family money to purchase newspapers and magazines and to found syndicates and movie newsreel companies throughout the United States. Born in San Francisco, California, on April 29, 1863, to millionaire parents who had amassed a fortune in mining properties, Hearst had the best of everything in life, including education. Two years after being expelled from Harvard, he wrote his father, George, “I want the *San Francisco Examiner*,” a newspaper that his politician father had taken for payment of a gambling debt. Granted his request, Hearst returned to California in 1887 and began a decades-long career in newspapers during which he both embraced and furthered the “new journalism” of scandalous stories, gossip, and exposés. Critics questioned Hearst’s brand of reporting on prurient stories and labeled most of his “news” fakery. With the *San Francisco Examiner* as his springboard, he began to build an empire of 42 newspapers.

In 1895, after his father’s death, Hearst moved his headquarters to New York City. He used some of the \$7.5 million his mother, philanthropist Phoebe Apperson Hearst, gave him to purchase the *New York Morning Journal*. Again, he boosted circulation with society gossip, tales of sex and scandal, and sensational stories. The *Journal*’s coverage of atrocities in Cuba aroused the public and helped spark support for the Spanish-American War. He also lowered the price of the paper. In so doing, he began

a newspaper war with Joseph Pulitzer's *New York World*, especially for Sunday circulation. Hearst hired away the *World's* entire Sunday staff, including Richard Outcault, who drew the popular comic strip "The Yellow Kid." Pulitzer hired the artist, George Luks, to continue the comic in the *World*, and both publishers advertised the strip widely, leading to the term "yellow journalism" as shorthand for the sensationalism spawned by newspaper rivalry.

Having made a splash in San Francisco and New York, Hearst moved on. Continuing to acquire major newspapers, he purchased the *Chicago American* in 1900, the *Chicago Examiner* in 1902, the *Boston American* in 1904, and the *Los Angeles Examiner* that same year. Hearst also founded King Features Syndicate and published and acquired magazines, including *Good Housekeeping*, *Cosmopolitan*, and *Harper's Bazaar*. A true multimedia maven of his day, Hearst also made a foray into movie newsreels.

Hearst was a maverick, and his papers took controversial positions. A progressive in his early years, he sup-

ported labor unions and the eight-hour workday, attacked monopolies, favored public ownership of utilities, and a progressive income tax. Although he thought of the Spanish American War as the *Journal's* war and of himself as a flag-waving patriot, Hearst was an isolationist prior to both world wars. Not an ideologue, but an indiscriminating, impulsive admirer of men of action, he at first welcomed the Bolshevik Revolution in Russia, admired Benito Mussolini, initially supported Franklin Roosevelt's New Deal, and published columns by Nazis. He later attacked communism and Roosevelt. Upon meeting Adolf Hitler in 1934, Hearst tried to move him away from anti-Semitism.

Hearst owned gold and silver mines, and at one time he was one of the leading real estate owners in New York City, California, and Mexico. Politically active like his father, who had been a senator, Hearst served two terms in the U.S. House of Representatives from New York City (1903–07) and ran unsuccessfully for mayor of New York City (1905) and governor of New York State (1906). He moved permanently to his 200,000-acre ranch in San Simeon, California, in 1927, where he amassed art and archaeological treasures. As a result of reckless spending in acquiring newspapers, real estate, and art, and investing millions in the movies of his mistress, actress Marion Davies, Hearst's empire came crashing down in 1937. The corporation owning his media conglomerates was \$126 million in debt. Hearst managed to stave off bankruptcy by selling off art, real estate, and 25 newspapers. In 1940 he still had a publishing empire that included 17 newspapers. He died at San Simeon on August 14, 1951, at the age of 88.

### Hepburn Act (1906)

The Hepburn Act of 1906 responded to the growing corporate concentration of the early 20th century by strengthening the regulatory powers of the Interstate Commerce Commission (ICC). The progressive movement, which had emerged from local-and state-level reform efforts in the late 19th century, had begun looking to make more sweeping policy changes to the ways in which Americans lived. The consolidation of economic and political power in the hands of a few, corruption and inefficiency in government, and the cost of industrialization were among the main concerns of reformers. With the opening of the century, and the succession of THEODORE ROOSEVELT to the presidency, the

progressive movement had a new and powerful voice in the administration.

One of Roosevelt's first initiatives as president was an attempt to regulate the trusts or monopoly enterprises that had come to dominate American industry. He did not believe in breaking up all, or even most, large corporations. Instead, he firmly believed that industrial concentration brought the United States wealth, productivity, and a rising standard of living. Accordingly, President Roosevelt advocated that government should be used to regulate these corporate consolidations and mergers, punish those that used their power improperly, and protect individual citizens from the power of industrial giants. He sought to expand government powers to allow for the oversight of economic development. In particular, he wanted to prosecute industries that attempted to monopolize the market, and to negotiate conflicts between capital and labor. The way to address the concentration of economic power, he argued, was not to break up these corporations and return to a simpler economy, but to regulate industry through the good offices of an enlarged and strengthened federal government.

Prior to Theodore Roosevelt's first term in office, the major piece of legislation that regulated industry in the United States was the 1887 Interstate Commerce Act, which created the Interstate Commerce Commission. This commission specifically had been designed to review and regulate shipping rates on American railways in order to protect the interests of individuals against the increasing power of railroads in the late 19th century. The ICC actually was rendered virtually powerless by a combination of weak enforcement powers and a judicial branch that often ruled against the ICC and its regulatory decisions. By the 20th century, there existed little legislation that could be used to effectively regulate any industry, including railroads. Roosevelt responded to this lack by recommending that the ICC be given broader powers to enforce its rulings. In 1906, on Roosevelt's initiative, Congress passed the Hepburn Act. As signed into law, the act gave the ICC specific powers of enforcement. Beyond giving the ICC greater power, the Hepburn Act set a precedent for future federal legislation aimed at regulating various aspects of the American economy.

## history

The writing of history, and historical scholarship in a larger sense, dates back to ancient Greece and the writings of

Herodotus and Thucydides, who retold the myths and chronicled the wars of their society. For centuries, recording of past times was the common pursuit of court chroniclers and political writers, who sought advantage, registered complaints, or sought to explain the origins of their countries and religions. By the 19th century, gifted amateurs and novelists, university teachers and political hacks participated in the business of writing history for both popular and academic audiences. In the late 19th century, however, history began to emerge as one of the central disciplines in the modern university.

Historians who sought the privilege and status of a profession established formal programs of education, formulated new practices, and created a new professional subculture for those in training. The history seminar and the archive took on new form and meaning in professionalizing how the past was recorded, written, and analyzed. In the new academic discipline of history, amateurs, historical novelists, and those who played to a popular audience were no longer historians in the same way as were their professional university-trained counterparts. Further, the dominant leaders in the discipline of history, and the overwhelming majority of its university teachers, were men, specifically white Protestant European and American men. Women, when they did write history, were thought to be amateurish, to engage in “pots and pans” history of ordinary life rather than the noble business of political history. Minority historians were similarly charged with writing either about trivial concerns or with too much personal investment. From the perspective of the new emerging profession, they fell far short of the standards of objective truth.

In the United States, the historical profession was well established in universities by the early years of the 20th century. A handful of prestigious schools, including Johns Hopkins University, Harvard University, Columbia University, and the University of Wisconsin, provided a home for the new generation of “progressive” historians who brought new questions, methods, interpretations, and—above all—a progressive perspective to a historical profession that was wedded to more conservative and narrow readings of the past. They also brought into history the methods and materials of the social sciences as a whole, in particular from economics, sociology, and political science, and reshaped the subject matter and interpretation of history. In many ways, the progressive historians challenged the practices of their own teachers. Capturing the past “wie es eigentliche war” (as it really was), in the words of German historian Von Ranke, was to be the goal of all historians. Other 19th-century historians celebrated history as the story of the nation-state from a supposedly objective perspective.

Progressive historians Charles Beard, Vernon Parrington, Frederick Jackson Turner, and Carl Becker had in mind a different version of history—one in which

objectivity, an ideal already challenged in the philosophy of science, was less important than rigorous analysis and an understanding of history as the story of conflict and contestation over resources in society. Turner in his studies of the frontier and sectionalism, Beard in his retelling of the making of the Constitution, and Parrington in his recounting of American intellectual and cultural life focused on the conflicts that arose during the development of the United States as a nation. While they were imbued with an understanding of scientific history, they also sought to link their history to a new politics and a new understanding of identity. In fact, Carl Becker radically challenged the ideal of objectivity and, implicitly, professional standards when, as president of the American Historical Association, he invoked the idea of “every man his own historian.”

The roster of American historians during the era included not simply the professionals who taught at the great universities but historians like Lucy Maynard Salmon of Vassar College, whose studies of newspapers, material culture, and domestic service offered a radical reimagining of what history might be; W. E. B. DuBois, whose work was located at the crossroads of sociology and history; Carter Woodson, the editor of the *Journal of Negro History*, whose work was pivotal to the recovery and restoration of the African-American past; and Mary Beard, whose *Woman as Force in History* inspired a later generation of women historians and overturned simple narratives of women's oppression to understand women's status and power in real terms. With her husband Charles, Mary Beard wrote important overviews of both American history and the history of Western civilization. She also wrote histories of labor unions and American humor, altering not just the method but expanding the subject matter worthy of historical study. These are but a few names of that generation of historians who merged concern for audience and political consequence in their work with new standards for historical analysis.

By 1930, the historical profession was well established. It had taken its place among the social sciences as a central discipline in higher education and in intellectual life. At the same time, history as a subject for amateur historians, novelists, filmmakers, and museum curators took on new meaning. While “popular” history was the subject of ridicule in the academy, widespread interest in roots, from the American Antiquarian Society and heritage associations, such as the Daughters of the American Revolution and the Daughters of the Confederacy, to the popularity of historical films and mass-market historical fiction, preserved documents, historical sites, and material culture for the use and interpretation of subsequent generations.

### Holmes, Oliver Wendell (1841–1935) *associate justice of the Supreme Court*

One of the American jurists most responsible for the retreat from legal formalism, Oliver Wendell Holmes served on the U.S. SUPREME COURT for more than 30 years. In his career on the bench, Holmes contributed to a growing body of civil liberties and policy law that expanded the role of the federal government. At the same time, he argued for the protection of individuals' rights to free speech, free assembly, and free press. Most of Holmes's influence, ironically, came from his articulate dissents from majority opinion. At a time when judges at both the state and the federal level continued to be enamored of natural law and highly protective of property rights, Holmes ventured into a legal philosophy that saw law and the courts not as a natural and inevitable development but as a response to the needs of society. Arguing for judicial restraint, Holmes envisioned a judiciary that would not heedlessly reject the democratic will. He developed his arguments for flexible and pragmatic application of the law in conversation with a younger generation of legal theorists, including LOUIS D. BRANDEIS and Roscoe Pound. His influence lingered on the Supreme Court with the appointment of Brandeis and later Felix Frankfurter to the bench.

Few of Holmes's achievements could have been predicted from his family background. His father, Oliver Wendell Holmes, Senior, was a doctor and a poet, whose poem on “Old Ironsides” kept the USS *Constitution* from being scrapped. The younger Holmes was born on March 8, 1841, in Boston, Massachusetts. After graduating from Harvard University, he joined the Union Army and served for three years during the Civil War, seeing action in the Union Debacle at Ball's Bluff, at Antietam, where he was left for dead, and at Fredericksburg. He was wounded three times before requesting and receiving a staff job. He left the army with the rank of captain. In 1867, Holmes was admitted to the bar and began to practice law. Holmes married Fanny Bowditch Dixwell in 1872. From 1870 to 1873, he edited the *American Law Review* and publicly lectured on common law. In 1882, while in his first term as law professor at Harvard, Holmes received an appointment to the Massachusetts State Supreme Court. He served on the court for 20 years, the last three as chief

justice. In 1902, THEODORE ROOSEVELT appointed Holmes to the U.S. Supreme Court as an associate justice. In that role, he wrote some of his most significant judicial opinions. In the case of *BUCK v. BELL*, Holmes exhibited some of his conservative social views. As a progressive proponent of EUGENICS, Holmes believed in social engineering and held similar views on human heredity. Carrie Buck's individual rights mattered little, compared to the threat that hereditary criminality and idiocy presented to society. Besides, he famously uttered, "Three generations of imbeciles are enough." In a series of cases after WORLD WAR I, Holmes essentially created the modern theory of civil liberties. Although in the first of these, *SCHENCK v. UNITED STATES*, he argued a more conservative point of view that freedom of speech was not unlimited, his later dissents in *Abrams v. United States* and other cases redefined the First Amendment. Holmes wrote that it was the "theory of our Constitution" that "the ultimate good desired is better reached by the free trade in ideas—that the best test of truth is the power of the thought to get itself accepted in the competition of the market." Democracy, he proclaimed, required us to be "eternally vigilant against attempts to check the expression of opinions that we loathe." Holmes served on the Court until he retired in 1932 at age 91.

### **Houdini, Harry** (1874–1926) *performer*

One of the most renowned magicians of the 20th century, Harry Houdini was born Erik Weisz on March 24, 1874, in Budapest, Hungary. His father brought the Weisz family to Appleton, Wisconsin, when Erik was still a baby. As a young man, he began to go by the name Ehrich. He later called himself Erie and finally settled on Harry. As a teenager, he worked as a cutter in a necktie factory. Working as a cutter proved to be too restrictive. He decided to escape the constraints of his work by becoming a magician.

Houdini's career progressed slowly at first. For many years he lived on the brink of poverty. He soon created a niche for himself. He began to captivate audiences with his own unique form of magic—the dramatic escape. His ability to escape from seemingly inescapable situations earned him a reputation that spread throughout the country and

Harry Houdini (Library of Congress)

eventually the world. Houdini's exploits allowed him not only to build a successful career as an escape artist, but also to redefine the art of illusion in the process. He amazed audiences by escaping from ropes, handcuffs, and locked containers in countless settings. In one show he was suspended, head down, 75 feet in the air. In the next he was submerged under water. Regardless of the setting, he played on the audience's fears and emotions. He was careful not to escape too early or too easily, in order to build excitement and anticipation. By the turn of the century, the act had begun to earn Houdini international acclaim. He performed in front of audiences of thousands. As the new medium of motion pictures developed, Houdini's notoriety spread even further.

Long before Houdini had found professional success, he had fallen in love with a young woman named Wilhelmina Rahner. In 1894 they were married. Thereafter, Houdini's young wife went by the name Beatrice, or Bess,

Houdini. She worked as his stage assistant. Together they captivated millions. Harry Houdini took his stage name from the great French magician Jean-Eugène Robert-Houdin. He did not, however, follow in his predecessor's footsteps. In 1908 Harry challenged the abilities of his namesake in his book, *The Unmasking of Robert-Houdin* as a way of declaring his independence not only from his predecessor but also from others in his profession. Unlike other magicians of his time, Harry claimed no supernatural intervention. His animosity for those who boasted of supernatural powers led him to launch a full-scale campaign against mind-readers, mediums, and others who claimed to have divine or supernatural powers. He wrote *Miracle Mongers and Their Methods* in 1920 and *A Magician among the Spirits* in 1924. Through these works, Houdini tried to expose men and women whom he believed were charlatans using tricks to fool gullible audiences. He argued that astrology and fortune-telling had no scientific basis. But even as Harry Houdini attacked those who claimed to have supernatural abilities, self-proclaimed spiritualists like Arthur Conan Doyle steadfastly maintained that Houdini himself used supernatural abilities to perform his miraculous feats.

On Halloween night in 1926, Houdini died of peritonitis that stemmed from a stomach injury. Years before his death, in an attempt to expose myths about the afterlife, he and his wife Beatrice made a pact. The first to die would do everything in his or her power to contact the survivor. Before her death in 1943, Beatrice declared the experiment a failure.

### **Hughes, Charles Evans** (1862–1948) *chief justice of the Supreme Court*

Charles Evans Hughes had a long and prolific political career in which he served as governor of New York, secretary of state, ran as Republican presidential nominee in 1916, and twice served as a justice on the Supreme Court, the second time as chief justice in the 1930s. Hughes was born in Glens Falls, New York, in April 1862. After completing his undergraduate education, Hughes took a law degree at Columbia University Law School. He began practicing law in New York City.

In 1905, after teaching law for many years at Columbia, New York University, and Cornell, Hughes gained regional notoriety following his appointment by the New York legislature to investigate state utilities and insur-

ance companies. Capitalizing on this exposure, Hughes decided to run for the New York governorship in 1906, at the urging of President THEODORE ROOSEVELT. He handily defeated newspaper magnate WILLIAM RANDOLPH HEARST. Hughes was reelected in 1908. In 1910, Republican president WILLIAM HOWARD TAFT appointed him to the Supreme Court, where he gained a reputation for being a liberal justice. Hughes's first stint on the court was short-lived. In 1916, he resigned and reluctantly accepted the presidential nomination of both the Republican and Progressive parties. Running against incumbent president WOODROW WILSON, Hughes ran a very effective campaign only to lose by fewer than 500,000 votes. Wilson received 277 electoral votes to Hughes' 254.

Hughes's political career was far from over. In 1921 President WARREN G. HARDING appointed Hughes to run the State Department. As secretary of state, he advocated enforcing the OPEN DOOR POLICY in China, negotiated a peace agreement with Germany after the Senate refused to ratify the TREATY OF VERSAILLES, and supported attempts to ensure American entry into the LEAGUE OF NATIONS. Hughes served from 1921 to 1929, first under Harding and then under President CALVIN COOLIDGE. Hughes was rewarded for his long tenure in office when President Herbert Hoover reappointed him to the Supreme Court, this time as chief justice.

As chief justice, Hughes clashed frequently and often publicly with President Franklin Delano Roosevelt (FDR). Hughes attempted to limit some of the more progressive and radical aspects of the New Deal, leading the Court in its rulings against the National Recovery Administration, the Agricultural Adjustment Act, and other New Deal initiatives. Hughes's conflict with FDR came to a head in 1937 when he led the charge against Roosevelt's attempt to "pack" the Court by expanding the number of justices from nine to 15. In order to protect the integrity of the Court, Hughes effectively marshaled public support against the plan. Behind the scenes, he proved willing to compromise and was the decisive vote in support of the National Labor Relations Act and the Social Security Act. Hughes retired from the Supreme Court in 1941. Harlan Stone replaced Hughes as chief justice, by which time FDR had appointed several other pro-New Deal justices. Hughes died in 1948.

## immigration

In terms of immigration, the period from 1900 to 1930 witnessed at least three noticeable trends. The first 14 years of the century brought with them the highest levels of arrival in the long wave of immigration that lasted approximately from 1830 to 1914. During this 80-year period, more than 22 million immigrants arrived in the United States, with some six million alone arriving during the decade from 1900 to 1910. Along with this steady increase in the volume of immigration to the United States between 1900 and 1914 came a dramatic and noticeable shift in the origins of immigrants. The third significant factor in immigration between 1900 and 1930 was that in the two decades after 1910 there was a sharp decline in the total number of immigrants arriving. The ending of the open door for immigration can be attributed first to the onset of WORLD WAR I and, secondly, to the passage of restrictive immigration legislation in the early 1920s. Combined, these two factors effectively closed the door to immigration and brought migration worldwide to a virtual standstill.

The steady stream of immigrants to the United States at the turn of the century were often the victims of nativist attacks, especially during the world war. Despite the common image of immigrants flooding the country, immigrants did not account for the sharp rise in the nation's population by 1930. Instead, natural increase (the excess of births over deaths) represented the main factor contributing to the population gains. From the Civil War to the First World War, only about 13 to 15 percent of the U.S. population were foreign-born. Although the number of newcomers accounted for about 40 percent of the nation's total population growth, the American-born children of immigrants were a major factor in the total population growth. Thus as the United States witnessed major economic changes with the advent of industrialization and urbanization, immigrants, especially given their different origins after 1890, often became the scapegoat for social problems in the growing nation. Without a doubt, immigrants played a central role in the indus-

trialization of the American economy. The availability of industrial work furthered the attraction of the United States to migrants from across the globe. Arriving in urban industrial centers, immigrants often had few other choices but to find employment as unskilled factory workers. The size of the industrial workforce grew dramatically from 4,252,000 in 1889 to 7,036,000 by the eve of World War I.

A family of immigrants looks out to the Statue of Liberty from Ellis Island. (*Library of Congress*)

1921–30	330	198	64	455	925	459

Source: U.S. Bureau of the Census, *Historical Statistics of the United States: Colonial Times to 1970* (Washington, D.C.: GPO, 1975).

Mass production industry brought significant changes to Europe as well. Accordingly, new and more efficient forms of transportation reached further into Europe, allowing eastern and southern Europeans to more easily migrate. In 1854, of the 427,000 immigrants entering the United States, more than 400,000 originated in Northwest Europe (e.g., Germany, Great Britain, and Ireland). By 1907, when some 1.2 million immigrants came to the United States, more than 900,000 were from Russia, Italy, Austria-Hungary, and the Balkans. While overall the percentage of foreign-born individuals in the total population remained virtually unchanged between 1860 and 1914, the percentage of immigrants and their American-born children throughout the Northeast and Midwest often exceeded 70 percent in cities like Chicago, New York, Milwaukee, and Detroit.

The new immigration faced hostility from nativist organizations like the Immigration Restriction League in 1894. Under its influence, members of Congress proposed various grounds for excluding immigrants, ranging from radical political views (e.g., anarchists) to illiteracy. Arguing that “the coming of Chinese laborers to this country endangers the good order of certain localities,” Congress in 1902 indefinitely extended the Chinese Exclusion Act’s ban on Chinese immigration. Other laws soon followed that established new grounds, ranging from radical political views (implemented in the ANARCHIST IMMIGRATION ACT of 1903) to marriage, on which to restrict entry and even rescind citizenship rights. The EXPATRIATION ACT of 1907, for example, stripped citizenship status from women, whether they were native-born or naturalized, if they married foreign nationals. An Asiatic Barred Zone, which cemented into place bars to immigration from all Asian countries except Japan and the Philippines, then an American protectorate, was declared in 1917. With this legislation, the federal government set the precedent of using race, as determined by nationality, as the basis for denying entry to the United States.

The vocal anti-immigrant sentiments of this time period ultimately pushed Congress in 1907 to appoint a commission to investigate issues related to immigration. Headed by Senator William P. Dillingham of Vermont, a

moderate restrictionist, the committee ultimately issued a 42-volume report. Playing on growing anti-immigrant sentiment, the report’s conclusions were not supported by the evidence amassed by immigration officials across the United States. The commission argued that the so-called new immigrants were racially inferior to the old immigrants from northern and western Europe. Manipulating statistical data, it provided a “scientific” argument calling for legislation to restrict entry to the United States. In essence, the commission’s contention that the “new” immigrants from southern and eastern Europe were incapable of becoming Americans found a welcome audience, especially as hostilities in Europe broke out in 1914. The IMMIGRATION ACT OF 1917, passed during World War I, was the first in a series of increasingly restrictive immigration policies that the Congress ultimately adopted in response to the DILLINGHAM COMMISSION. The 1921 QUOTA ACT and the 1924 NATIONAL ORIGINS ACT, with their use of restrictive quotas, cemented the commission’s recommendations into national policy.

Although the main focus of immigration policy after 1900 was on restricting entry from Europe and Asia, countries within the Western Hemisphere also contributed significant numbers of newcomers. Because the borders between Canada, Mexico, and the United States remained open, they allowed for the relatively easy movement of migrants among the nations. Only with the passage of the 1924 National Origins Act did the federal government create an agency (the Border Patrol) specifically charged with the policing of the land borders between the United States and its northern and southern neighbors. Although today the border between Mexico and the United States receives far more attention, between 1900 and 1930 more immigrants entered the United States from Canada than from Mexico. Nonetheless, both nations became more important as sources of immigration after the passage of the 1924 National Origins Act, which excluded them from its restrictions.

### Immigration Act of 1917

The Immigration Act of 1917 was the first immigration law to employ a literacy test. Passed in reaction to the high tide of immigration between the 1880s and the onset of WORLD WAR I, it sought to limit the number of immigrants, particularly those from southern and eastern Europe. The number of immigrants was 788,922 in 1882 and reached 1,285,349 in 1907. Not only did the number of immigrants steadily increase, but the countries of origin for immigrants dramatically shifted as well. Although emigrants from Austria-Hungary, Italy, Russia, and the Balkans were nonexistent in the 19th century, combined these countries sent nearly 75 percent of the immigrants who arrived in the United States in 1907. By this time, vocal opposition already challenged earlier “open door” immigration policies, but the nativist movement in the United States failed to enact any major pieces of legislation affecting the migration of individuals into the country.

The context for immigration policy changed with the entry of the United States into World War I. Patriotic and national unity efforts, and fears of immigrant subversion, culminated in increasing and systematic efforts at the “Americanization” of immigrants. The champions of immigrant restriction reached their first significant victory in 1917 with the passage of the Immigration Act, also known as the Alien Exclusion Act. It was the first in a series of restrictive immigration laws based on the findings of the DILLINGHAM COMMISSION. The cornerstone of the 1917 act was a literacy test. All immigrants over 16 years of age who could not pass were denied entry to the United States. The Immigration Act also banned the immigration of laborers from India, Indochina, Afghanistan, Arabia, the East Indies, and several other countries within an Asiatic Barred Zone. The act did not explicitly prohibit the entry of emigrants from China and Japan, because other laws already restricted emigration from these two countries. The 1917 legislation was the first step in establishing restrictive federal immigration policies based on a rank order of eligible immigrants that favored national groups thought to be most assimilable—primarily emigrants from northwest Europe. When President Wilson received the legislation, he declared the act was a violation of American ideals

and traditional open door immigration and vetoed the law. Congress overrode his veto. The Immigration Act of 1917 would stand as the major piece of federal policy governing immigration to the United States until more restrictive policies were enacted in the 1920s.

### Industrial Relations Commission (USCIR)

Congress created the Industrial Relations Commission in 1912 to study the rise in labor violence. As the labor movement grew steadily between 1900 and 1910, some unions adopted more aggressive methods for gaining recognition and concessions. Many employers met the new growth and militancy of the labor movement with rigid opposition. They were willing to adopt more aggressive means for defeating strikes and keeping unions out of the workplace. Their methods included industrial spying, private security forces, and using local police forces and state militias to physically remove striking employees. When employers launched a counteroffensive against the labor movement, violent confrontations escalated. The incident that prompted Congress to take action was the October 1, 1910, bombing of the antiunion newspaper, the *Los Angeles Times*. The commission was created as one of the last actions of WILLIAM HOWARD TAFT’s presidency.

The new president, WOODROW WILSON, had developed ties with the AMERICAN FEDERATION OF LABOR (AFL). In 1912, he was the first U.S. president elected with the backing of organized labor. Looking to strengthen government’s labor ties and concerned that the spread of labor violence would spill over into a larger class conflict, Wilson named labor progressive Frank Walsh to head the Commission on Industrial Relations. As chair of the commission, Walsh had strong ideas about the plight of American workers.

Under Walsh’s direction, the Industrial Relations Commission went beyond its original mandate of uncovering the reasons behind the recent rise in labor violence. In its report, the commission laid most of the blame at the feet of employers and the growth of economic inequality. The final report of the commission argued that workers found it increasingly difficult to organize unions and conduct successful strikes. Employers fired suspected union sympathizers, secured court injunctions against strikes and boycotts, hired replacement workers to break strikes, created company controlled unions, and forced employees to sign yellow-dog contracts agreeing not to join an independent union. Workers and unions felt frustrated at every

turn. This situation was exacerbated, the commission concluded, by the use of spies, private security forces, and state and federal troops, which intimidated, harassed, and even killed union members. The commission also pointed out that the turn-of-the-century boom in industrial production had created tremendous poverty and suffering.

Although the commission covered numerous labor disputes, it spent much of its time examining the causes of the LUDLOW MASSACRE of 1914. During a routine mining strike, private security forces and local National Guard troops fired upon striking miners and their families, resulting in 32 deaths. In investigating the causes of the violence, the commission called dozens of witnesses, including mine owner John D. Rockefeller, Jr. The commission's final report was extremely critical of Rockefeller's handling of the strike and held him personally responsible for the miners' deaths. Released in the summer of 1915, the report was a scathing indictment of Rockefeller in particular and antiunion employers in general. It set off a political firestorm. Antiunion employers and conservative politicians were outraged. Arguing that Walsh was in the pocket of the labor movement, they maintained that the report should be ignored. Conversely, the generally divided and contentious labor movement greeted the Industrial Relations Commission's findings with universal support and enthusiasm. Many in the labor movement agreed with commission chair Walsh when he concluded that the only viable way to prevent future labor violence was for employers, the courts, and government to adopt a policy of industrial democracy. Workers should be allowed to form unions, he argued, free from employer interference and company violence. Under such a system, wealth would be distributed more equitably and social peace would reign. In the long run, both politicians and industrialists ignored the commission's recommendations, and violent clashes between workers and employers continued to occur.

### Industrial Workers of the World (IWW)

The Industrial Workers of the World (IWW) was a union movement that surfaced in the first decade of the 20th century as a more radical alternative to the AMERICAN FEDERATION OF LABOR (AFL). Also known as the Wobblies, the IWW emerged in response to changing social, economic, and political circumstances. The post–Civil War industrial revolution and the growth of trusts and giant national corporations

resulted in tremendous social inequality. The new industrial working class that emerged in these years was much more ethnically and racially diverse than ever before, as millions of eastern and southern European immigrants entered the country and found employment in urban factories.

The industrial working class was expanding at the same time that the nature of work was changing. Building on the principles of SCIENTIFIC MANAGEMENT introduced by FREDERICK WINSLOW TAYLOR and others, corporations began to break down the production process into specialized tasks. Each separate motion was studied and analyzed, so it could be performed with maximum speed and minimum training. The new machine operators were not the kind of workers that the AFL had helped organize in the past. Between 1880 and 1900, the labor federation had been successful in organizing white craft workers. Because they often shared similar ethnic and regional backgrounds and, moreover, had specialized knowledge that employers could not easily replace, skilled workers were easier to organize. The decision of employers to de-skill and diversify the industrial workforce was directed at undermining the power of skilled workers and preventing them from forming unions.

Under the leadership of Samuel Gompers, the AFL had built a solid base of support among skilled white workers. Adhering to “pure and simple” unionism, the AFL avoided mass organizing tactics and did not seek control over employers' profits. Between 1880 and 1900, the labor federation did little to oppose these efforts in mass production industry. In exchange, the AFL often secured guaranteed contracts, pay increases, and shorter workdays for its trade union members. This cautious strategy led to important gains for skilled white workers, but it did little for dislocated farm laborers and unskilled African-American and foreign-born workingmen and women.

The IWW attempted to fill the void left by the AFL. Officially organized in 1905, it traced its origins to the labor organizations of silver, copper, and gold miners in the West. By 1890, mine workers were engaging in frequent conflicts with mine owners determined to maximize their profits. Disgruntled and militant miners formed the Western Federation of Miners (WFM) in 1892 and began demanding better pay and working conditions. Between 1894 and 1905, conflicts between the WFM and mine owners grew increasingly common and violent. Often strikes were defeated when mining companies convinced state and federal officials to use military troops to arrest strikers and keep the mines open. When the state militia brutally put down a 1904 strike in Cripple Creek, Colorado, leaders of the WFM concluded that a national movement of industrial workers, miners, and migratory farm laborers was necessary to challenge the dominance of antiunion employers, state legislators, and federal officials.

Cartoon lampooning the Industrial Workers of the World  
(Library of Congress)

In 1905, the WFM joined with over 40 labor organizations to form the IWW. Some of its leaders included WILLIAM “Big Bill” HAYWOOD, EUGENE V. DEBS, ELIZABETH GURLEY FLYNN, Mary Harris “Mother” Jones, Joe Hill, WILLIAM Z. FOSTER, Lucy Parsons, and Daniel De Leon. Highly critical of the conservative AFL, the IWW committed itself to organizing semiskilled and unskilled workers, regardless of their race, ethnicity, or gender. In contrast to the AFL’s cooperative approach, the IWW advocated socialism and syndicalism. Reluctant to sign union contracts, it preferred to pursue goals through work stoppages, general strikes, boycotts, strikes and other forms of direct action.

Championing the slogan “One Big Union,” the Wobblies had limited success organizing western miners, semi-skilled and unskilled factory workers, lumber workers, farmers, and western shipyard workers between 1905 and the outbreak of WORLD WAR I in 1914. Internally, the IWW was racked by conflicting ideological viewpoints. One faction, led by De Leon and Debs, advocated political action and close ties with the Socialist Party of America. Led by Big Bill Haywood, the rival faction championed syndicalism, or the theory of industrial organization. As syndicalists, they advocated the use of strikes, boycotts, general strikes, and even industrial sabotage to improve workers’

conditions. These internal divisions came to a head in 1908 when the more radical syndicalists gained control of the IWW, and Debs, De Leon, and other socialists left the organization.

Under Haywood’s leadership, the IWW aggressively pursued direct action against antiunion employers. In 1912, textile workers in Lawrence, Massachusetts, the majority of whom were women and underaged children, walked off the job when managers at the American Woolen Company announced a plan to reduce wages. Company officials had intentionally hired an ethnically diverse workforce, believing that ethnic animosity would prevent workers from forming a union or conducting an effective strike. The IWW’s commitment to organizing all workers bridged the ethnic divide in the workforce and created a unified front. Several striking workers were killed before public pressure persuaded the company to agree to the IWW’s demands. A year later, the IWW backed a strike by silk workers in Paterson, New Jersey. Almost immediately, the strike turned violent. Private security forces hired by the company killed several strikers, and local police arrested over 3,000 workers. The Paterson strike ended in defeat when the union was unable to provide pay or food for striking workers.

The IWW was most successful in organizing miners and migrant farm and timber workers in the West and Northwest, many of them through the Agricultural Workers Organization. Although the organization never achieved the level of success of the AFL or seriously challenged corporate power, the IWW remained an anathema to many employers and politicians. With the outbreak of World War I, the IWW came into greater national prominence when it publicly opposed American entry into the war. Many Wobblies were jailed under state criminal syndicalism laws. Haywood and 165 other IWW leaders were arrested and convicted under the ESPIONAGE ACT of 1917 for hindering the war effort. Haywood received the harshest sentence, a 20-year prison term. He fled the country when released pending an appeal of the sentence. Between 1917 and 1920, the IWW was the target of coordinated attacks led by the federal government. In May 1918, IWW offices in Centralia, Washington, were raided by a local mob led by prominent political and business leaders. In November of the following year, a mob once again attempted to raid the IWW’s offices in Centralia only to be met by armed resistance. When the fighting was over, five people had been killed, including the IWW’s Wesley Everest, who had been castrated and lynched by the mob. Similar repression took place throughout the Northwest where the IWW had been strongest. By the end of the year, the union was in total disarray, and it ceased to be an effective force in the labor movement. As an organization committed to organizing workers regardless of their skill level, gender, race, or

ethnicity, the IWW represented a radical alternative to the conservative trade unionism of the AFL.

## intelligence tests

Intelligence tests emerged in the Progressive Era as a means for evaluating individual abilities, channeling individuals into particular lines of education and work, and restricting immigration. Battles over the nature of intelligence, however, had been waged for centuries. In the middle of the 19th century, two prominent scientists formally structured the terms of the debate. John Stuart Mill and Francis Galton promoted two diametrically opposed theses regarding the development of behavior and intelligence. Where Galton saw nature, Mill saw nurture. Galton was convinced that genetics were the predominant force in the development of intelligence. Mill, on the other hand, championed the idea that social conditioning was the prevailing force. Galton used his idea of the supremacy of nature to develop the first intelligence tests, which were hindered by his preconceptions. He saw a direct correlation between intelligence and motor functions. Thus, his tests assessed motor skills and not intelligence.

Dozens of scientists followed in Galton's footsteps. It was not until Alfred Binet (1857–1911) developed his theories, based on assumptions closer to Mill than to Galton, that real progress was made at charting human intelligence. Binet pioneered the method of analysis that is still prevalent in many intelligence tests today. When Binet's theories were fully developed, the resulting tests were far superior to anything that Galton or his followers had offered. Tests that followed Binet's fundamental assumptions attempted, and to a degree succeeded, in ascertaining some of the roots of intelligence.

As variations of the Binet intelligence tests became the norm in the early 20th century, they were used to distinguish differences. The first major distinction made was based on sex. Men and women scored differently on the test. As a result, assumptions were made regarding the relative intelligence of men and women. The tests also were used in an attempt to determine who was more likely to commit a crime, and it was discovered that prisons were filled with men and women who tested low on the Binet

Scale. The term “feeble-minded” was used to describe adults who tested at a level below that of a 13-year-old child. Both of these theories were challenged soon after they were presented. Despite advancements in testing methods, the test was culturally biased in its measurements.

During WORLD WAR I the U.S. Army used the best available test, the Stanford-Binet intelligence test, to determine the mental competency of soldiers. The tests, like those before them, relied on assumptions that those tested would have a firm understanding of American history as well as social and cultural norms. As a result, testees without the requisite background were deemed less intelligent. The army dropped the tests in 1919, but alternative intelligence tests were soon developed and implemented to measure intelligence both in and out of the Armed Forces.

During the 1920s, intelligence testing became closely associated with ethnic, racial, and class-based stereotypes. During that decade of ethnic and racial division, intelligence tests were used to support limits on the rights and liberties of ethnic and racial minorities. They provided support for legal restrictions on immigration. While ethnic and racial minorities were the primary targets, these were not the only stereotypes to be reinforced through intelligence testing. It became an effective tool in reinforcing the political, social, and economic systems. Simply put, intelligence tests provided the rationale for social inequality. But when wealthy rural Americans scored poorly on the tests, the idea that the rich were naturally smarter than the poor was undermined.

Intelligence tests presented more new questions than they answered. The nature of intelligence, whether determined by nature or nurture, was not solved by the tests. In fact, IQ tests provided ammunition for proponents of both schools. Those who supported the idea that intelligence was rooted in heredity could use the scores as proof. Those who championed nurture over nature also employed them as evidence of the importance of environment in cultivating intelligence.

## International Ladies' Garment Workers Union (ILGWU)

A semi-industrial union of workers in the women's and children's clothing industry, the ILGWU was formed in New York in 1901. Influenced heavily by Jewish radi-

icals, it combined conservative craft unionism with industrial organization in an industry that was predominantly female. Primarily a union of skilled workers such as cutters and pressers, the ILGWU expanded its membership in a series of dramatic strikes in 1909–10 and later in 1913–15 in the clothing industry. The chief of these strikes, the SHIRTWAIST MAKERS STRIKE, or Uprising of the 20,000, involved garment operatives in sweatshops in the New York shirtwaist trade. Begun by skilled male workers, the strike came to involve tens of thousands of young women garment workers. The industry's labor force, mostly Eastern European Jews and Italians, with a small contingent of native-born American women, went on strike when garment manufacturers refused to sign union contracts. While many smaller garment shops negotiated with the union, the majority of large garment companies simply waited out the protest. That same year, the Cloak Makers' Strike of 50,000 successfully concluded with the Protocols of Peace, an agreement that provided for increased wages and a 50-hour week. It also promised to end strikes in the industry, in exchange for concessions from employers. A year later, in 1911, the tragedy of the TRIANGLE SHIRTWAIST FIRE brought thousands to join the union in protest of the conditions that had led to the fire, namely locked doors, flimsy fire escapes, and hazardous working conditions. From 1913 to 1915, the ILGWU once again led strikes that made it the dominant union in the garment trade and a major player in union politics in the 1920s.

In the 1920s, factional fighting between socialists and communists weakened the union. The socialist leadership, under president Benjamin Schlesinger, later suspended ILGWU members who belonged to the communist Trade Union Education League. The loss of union negotiating power was largely attributable, however, to the ability of clothing shops to leave union strongholds for other areas. Runaway shops were almost impossible to organize, as they were easily moved and had little capital invested. Finally, fundamental differences between the older men who ran the union and the women who constituted the majority of the workforce contributed to the ILGWU's declining membership. The union's predominantly male leadership paid little attention to the more than 75 percent of the membership that was female. It preferred to negotiate contracts without reference to women workers whom it believed were temporary sojourners in the garment trade. Male union leaders saw their work as a route to political influence and upward mobility and excluded all but a few women from their ranks.

During the 1920s, the union spent much of its time and resources building a range of benefits and institutions to retain members' loyalty. The ILGWU had a strong workers' educational program. It trained workers in union leadership and in basic cultural and citizenship skills. It supported

special programs for workers' health and Unity House, a summer retreat for workers. It also had its own newspaper, called the *Ladies' Garment Worker*. These resources and programs helped the union survive the decline in its membership and aided the union in its rebirth in the 1930s.

## invention and technology

Technology—things human beings invent, discover, manufacture, and use—has been part of humanity as long as humanity itself. We may think of ourselves as living in a technological age, but machines and systems, tools and artifacts, have affected Americans in profound ways. The 20th century is often referred to as “the American Century,” largely because the growth of big business, sophisticated industrialized systems, and a powerful military complex made the United States a leading superpower. Technological change and advance were central to America's maturity.

Inventions introduced during the early 1900s have now become hallmarks of American culture. Individual examples include crayons, the ice cream cone, Life Savers® candy, and liquid paper. African-American inventor Garrett Morgan invented the traffic light in 1920; and in 1930, Ruth Wakefield introduced Toll House Cookies. But the technological vitality of the United States in the first three decades of the 20th century is demonstrated less by particular inventions than by new technological systems that were embraced and reshaped American society.

Although there were many important advances in science and technology prior to the 20th century, the development of complex technological systems after 1900 changed the nature of humankind's relationship with machines. Advances in technology coincided with the rise of an industrial economy at the turn of the century, as Americans witnessed a technological explosion unprecedented in recorded history. Improvements on an earlier “American System” of manufacturing standardized, interchangeable parts culminated in a system of MASS PRODUCTION in the early 1900s. It opened the way for technology to play a central role in the modern consumer economy. The application of ELECTRICITY to such areas as public lighting and urban streetcars spread into the domestic sphere to include the powering of household appliances by public utilities, a change that shaped people's lives perhaps more than any other technology. Electrodynamical principles applied within the communications industry also resulted in major advances such as wireless telegraphy, the amplification of sound, and broadcasting. Between 1900 and

1930, technological development increasingly became the domain of corporations competing for patent rights and control of the market, resulting in a shift of emphasis in American invention from machine shop to industrial laboratory. Early 20th-century advances in transportation and industrial manufacturing, the rise of “big SCIENCE,” and advances in communications constitute some of the most crucial examples of systems building in American history.

Achievements in transportation included the introduction of powered flight and the mass production of gas-powered automobiles during the first decades after 1900. The WRIGHT BROTHERS, Wilbur and Orville, are probably the most famous of aerodynamic designers to achieve controlled, powered flight in the United States. On December 17, 1903, the Wright Brothers demonstrated their success with their *Flyer I* in North Carolina, and by 1908 they took their airplane across the Atlantic to give demonstrations in Europe. WORLD WAR I was a powerful impetus for all industrialized nations to pursue technological improvements on airplanes. By 1920, the National Advisory Committee on Aeronautics convinced Congress to establish

facilities for developing aircraft in the United States, integrating civilian and military aircraft manufacture into a major industry.

While the automobile was not a uniquely American invention, development of a moving assembly line to mass-produce affordable cars was pioneered by entrepreneur HENRY FORD. Ford revolutionized automobiles and industrial manufacturing with the production of his Model T. Designed in 1908, the Model T first was produced on an assembly line in Highland Park, Michigan, in 1913. By 1923, production of the Ford Model T had risen to nearly 2,000,000 a year. The simplified design of the car, the decision to freeze the design and stick with one model, and the use of specialized machines allowed Ford to build an enterprise that forever changed American industrial manufacturing.

Ford's application of the moving assembly line to the production of his motorcars integrated the principles of the American System of Manufactures, a 19th-century technology, with the modern principles of SCIENTIFIC MANAGEMENT, championed in the 20th century by American engineer FREDERICK WINSLOW TAYLOR. Scientific management rationalized the entire system of manufacturing as a whole and sought to eliminate wasted movement through the use of single-purpose machines and automated assembly lines. The drive for efficiency reduced labor to the bare minimum, as single-purpose machines created single-movement jobs for unskilled workers, resulting in a reorganization of shop culture. One of Ford's major innovations was his decision to shift the production layout to a sequential arrangement, so that parts and machines could be set up in the order they were assembled. His introduction of a system of vertical integration at his River Rouge plant in the 1920s allowed scientific management and mass production to reach their logical extremes. It set a precedent for modern industrial ARCHITECTURE and manufacturing in the United States.

Scientific management and a drive for order, efficiency, and control within a free-market economy influenced the rise of scientific industrial research laboratories within large corporations. Whereas independent inventors operating in small machine shops created the bulk of new technology, economic growth and expansion changed the nature of invention, speeding the transformation from small-scale, isolated experimentation to large research industries. The stipulations and time limits imposed by the American patent system, coupled with strict enforcement of antitrust laws, fostered competition among corporations who sought to control new technologies and the market. Corporations such as GENERAL ELECTRIC, DuPont, Westinghouse, and Dow Chemical developed model industrial research labs between 1900 and 1930. These companies invested large budgets on high salaries

**Down where Nature cannot send her cooling breezes Science sends the Electric Fan**

Down in the caverns of steel and stone where armies of office workers are meeting the strenuous problems of a business day—where excessive heat tends to retard the productive power of human energy—there electrical science carries the refreshing help Nature finds it so difficult to give.

The G-E ELECTRIC FAN, the result of twenty years' experience in the great factories and laboratories of the General Electric Company, is one of Electricity's most effective means of increasing man-power by increasing man-comfort—of raising the standard marked by that magic word Efficiency. In the home, as in the office and factory, the G-E Electric Fan is efficiency's "first aid"—summer comfort's best assurance.

And it gives both with a truly modern economy. It can be operated four hours for a cent—in reality attached to any lampsocket—gives a lifetime of satisfactory service.

**THE GUARANTEE OF EXCELLENCE on Goodie Electrical**

The EDISON MAZDA LAMP is another proof of Electricity's great service to efficiency and to comfort. This wonderful lamp has scratched electricity from the luxury list by giving more light for less money. In fact, it uses but one-third the current required by the old-style carbon lamps.

With the current you save by using Edison Mazdas, you can run your G-E FAN or any of the many G-E devices for increasing the comfort of the home. With the G-E ELECTRIC PLATIRON, for example, you can do the family ironing, indoors or out, in less time, with less labor, and less physical discomfort than ever was possible with the old-fashioned stove-heated iron.

Any electrical dealer or lighting company will gladly show you the various styles and sizes of G-E Fans, Platinons and Edison Mazda Lamps.

**GENERAL ELECTRIC COMPANY**  
Sole Offices in all Large Cities The largest Electrical Manufacturer in the world Agencies Everywhere

Cool bedrooms on beautiful nights by means of G-E Fans.  
Make your drink your living room this summer with Edison Mazda Lamp and G-E Fan.  
An evening family sitting for 15 cents with the G-E Platinon, \$1.25.

New technology such as the electric fan helped cool down the hot summer months. (Library of Congress)

and almost unlimited resources for the best minds to collaborate and apply scientific techniques to technological problems. Despite the heroic myth of the lone inventor, technological development in the 20th century has largely resulted from the collaborative efforts of engineers, scientists, and entrepreneurs working in industries sponsored by business and government. While the independent inventor did not disappear, the first three decades of the 20th century laid the foundation for the development of a military-academic-industrial complex. Military and wartime strategies have largely influenced collaborative technological development since World War I.

Research and development was driven by efforts to increase productivity and profits. Largely successful, it resulted in a new type of technological partnership between private industry, universities, and the federal government. Government technological leadership included the establishment of the National Bureau of Standards in 1901, introduced with the mission of “working with industry to develop and apply technology, measurements, and standards in the national interest.”

Attempts to standardize tools and processes within the context of “big science” have no doubt altered industrial and social organization. But even as experimentation led to new improvements in old products and processes, the market ultimately controlled the development and spread of new technologies. Advances in chemistry, electric power, and electronic communications have been the result of a race to make new technologies better through a combination of scientific theory and application.

The rise of big science—collaboration between corporations, universities, and the military—was significantly shaped by the race to control technological development in the area of communications. Photography had already become a familiar technique by the end of the 19th century, but the 1900s witnessed the introduction of George Eastman’s portable, handheld camera. Cinematography also evolved into a popular medium during this period. But the race to control the communications industry really involved research and development in electronics. Major advances in wireless communications between 1900 and 1930 included Italian-American inventor Guglielmo Marconi’s successful achievements in wireless telegraphy; achievements in the transmission of real sounds, pioneered by Americans Lee De Forest and Edwin Armstrong; progress in wireless RADIO broadcasting, sponsored by corporations such as RCA, GE, Westinghouse, and AT&T; and Philo Farnsworth and Vladimir Zworykin’s experiments with cathode-ray tubes, which led to the development of television. Control of these new mechanisms and systems was sought through the buying and selling of patent rights, and legislative regulations such as the Radio Acts of 1912 and 1927, which established the Federal Communica-

tions Commission. Once the American Navy, in particular, became increasingly dependent upon wireless communications and had a vested interest in the development of vacuum tube technology, military research and development demanded federal regulation.

Throughout the 20th century, no one individual or institution has been able to control the market for electronic technologies. Isolated amateur inventors outside the military-academic-industrial complex, the federal government’s strict regulations against monopolies, and the competitive nature of the American free market have ensured rapid changes in communication technologies.

The most profound American technological developments from this period involved the creation of complex systems that have produced useful products, but also created an interconnected technological society, thereby truly transforming the United States into a modern industrial society. The unintended consequences of the implementation of these developments are crucial to assessing American technology’s far-reaching impact.

## investments, foreign

The international movement of capital has played a critical role in the economic development of the United States. Prior to the early 1890s, American investors’ sustained capital investment abroad was minuscule. Between 1890 and 1914, however, the United States became a major exporter of foreign capital, particularly to Canada, Latin America, and Europe. Well into the 1930s, U.S. investments in countries of the Western Hemisphere accounted for an estimated 65 percent of all American investments abroad.

Prior to the 1890s, Great Britain long had been the chief source of foreign capital investments, even in the Western Hemisphere. As the manufacturing base of the United States matured in the 1890s, American investors had additional capital available for export. Great Britain’s dominant form of capital investment had been loans to

governments and to railway companies. In contrast, the dominant way that the United States exported capital was in the form of direct investments abroad.

Although the United States did loan capital to foreign governments, especially during WORLD WAR I, the creation of branch plants that manufactured goods for foreign markets characterized most of its economic expansion abroad. While the United States and Great Britain competed with one another at the turn of the century, the onset of the war in Europe brought a dramatic shift to the international capital market. Because Great Britain had to expend much of its surplus capital on the war effort the United States had new opportunities to further expand its industrial production and thus had additional surplus capital for investment abroad.

Prior to the onset of war in 1914, the United States imported more goods from Europe than it had exported to the European continent. The destructive war severely crippled the European economy, both in terms of its factories and cities and the availability of labor. The United States benefited both by exporting more goods to Europe and by changing the balance of trade and investment. After the war, European citizens owed private Americans \$3 billion, and their governments owed another \$10 billion. Wartime loans from the United States to Europe constituted the primary source of this capital imbalance. The increasing level of American capital invested abroad reflected the changing position of the United States in the international economy between 1900 and 1914. Between 1897 and 1914, American direct investments abroad more than quadrupled, increasing from an estimated \$634 million to \$2.6 billion. Although investments abroad took many different forms, investing directly in manufacturing operations in Europe and Canada tended to be the major form. By contrast, American investments in Latin America tended to be in transportation and raw materials.

During the early part of the 20th century, promoters of American economic expansion abroad contended that this activity promoted development and not economic dependence. President THEODORE ROOSEVELT's secretary of state, Elihu Root, argued, "Our surplus energy is beginning to look beyond our own borders, throughout the world, to find opportunity for the profitable use of our surplus capital." Along with investors, the federal government played an active role in promoting the export of American capital. In particular, such agencies as the U.S. Consular Service, an office of the State Department, provided manufacturers and merchants with regular information about investment and market opportunities in locations across the globe. The monthly reports submitted by the Consular Service were published in the State Department's *Monthly Consular and Trade Reports*. They were further disseminated as numer-

ous newspapers and trade journals reprinted various parts in their own publications. To further assist manufacturers with their plans for economic expansion, the Departments of State and Commerce often requested specific information from various consulates. For example, they would ask that consulates provide information on the condition of a particular industry or presence of a commodity in various markets around the world.

While foreign capital investments found much support in the United States, they had a profound effect on the development of the nations that received much of this capital. In particular, American manufacturers owned some 60 percent of Canada's industries by 1919. This meant that the Canadian standard of living was indirectly set by the United States. American-owned companies determined wages, output, and investment strategies for a significant segment of the Canadian economy.

The investment in manufacturing enterprises abroad was made in various ways, ranging from the transfer of patent rights to the investment of actual dollars in the company. In 1904, Gordon MacGregor founded the Ford Motor Company of Canada, not with a direct capital investment from Ford in the United States, but rather by granting the latter 51 percent equity in the new company in exchange for all Ford rights and processes in Canada, New Zealand, Australia, India, South Africa, and British Malaya. Often the impetus to set up manufacturing in another country was motivated by high tariffs in that country. In Canada, a high tariff had prevented many American companies from exporting to the Dominion, so investing in branch plants that manufactured for the Canadian market provided a means to bypass the high tariff wall constructed by the Canadian government.

Because the United States had emerged from World War I as the dominant nation, its economic expansion would have far-reaching ramifications. The international economy had increasingly become integrated, and the United States relied heavily on foreign trade and foreign investments. In particular, given that European nations owed substantial amounts to the United States, there was a vested interest in the open movement of capital and goods through the international economy. The collapse of the stock market in 1929 would, accordingly, have profound effects not only on the American economy but also on the world.

## jazz

A uniquely American genre of music, jazz had its origins in New Orleans and in the urban North, where musicians and more recent migrants brought together diverse elements of African-American and European music into a new form. In music clubs, musicians drew upon their cultural traditions of down-home blues, minstrelsy, and brass band music, while others brought in elements from their formal European musical training. Jazz was and remains an amorphous music that is both rhythmically driven and at the same time open to the freedom of individual improvisation and interpretation. Syncopation, blue or indeterminate notes, rough vocal style, and improvisation form the boundaries of the genre. Within these lines, there is a multitude of styles. GEORGE GERSHWIN, whose music was a hybrid of TIN PAN ALLEY and jazz influences along with classical technique, wrote, "It is difficult to determine just what enduring values, aesthetically, jazz has contributed, because 'jazz' is a word which has been used for at least five or six different types of music." Expatriate musician Sidney Bechet, a native of New Orleans, claimed that jazz was "a name the white people have given to the music."

Whatever jazz was, it drew from a range of cultural influences. In New Orleans, diverse musical traditions first began to reshape musical idiom into what became recognizable as jazz. By the 1890s, ragtime, a syncopated jazz music, emerged and became popular with African-American listeners and increasingly with white audiences. By 1906, Jelly Roll Morton started touring nationally with his new jazz piano compositions. Dixieland jazz, ragtime's first heir, first made its appearance in recording in 1917. Other innovators, such as Chicago's Joe "King" Oliver, New Orleans' Sidney Bechet, and New York's Fletcher Henderson began to work out arrangements that combined blue notes with ragtime rhythm for a "hot" sound. In 1923,

King Oliver's band recruited New Orleans jazz trumpeter Louis Armstrong to make recordings for a broader audience. Armstrong moved on to make his own mark with the classic Hot Five and Hot Seven recordings (1925–28) that featured jazz solo improvisations. In New York, jazz music became, with African-American literature, one of the lasting elements of the cultural rebirth known as the HARLEM RENAISSANCE and greatly contributed to the emergent culture of the 1930s. Jazz music, early defined as an African-American musical style, attracted growing numbers of white patrons and musicians by the late 1920s. Further, while Fletcher Henderson created the first jazz dance band in 1923, the demand for hot jazz dance music fueled the careers of Edward "Duke" Ellington and others. Innovative white musicians such as Bix Beiderbecke, Hoagy Carmichael, Benny Goodman, and Artie Shaw adopted these jazz styles and organized their own bands in the 1930s, when swing music began to take hold of the popular imagination.

Ward, *Jazz; A History of America's Music* (New York: Knopf, 2000).

**Johnson, Hiram Warren** (1866–1945) *politician*

The Progressive Era was a time of political realignment, in which political parties were divided in sentiment and program and regional party loyalties were at stake. The career of Hiram W. Johnson reflected these tides of change. As a western progressive, Johnson fought for and achieved democratic reforms in his home state of California. He also struggled against the dominance of business in local and national politics and urged the adoption of labor laws and farm relief. In foreign affairs, Johnson was an isolationist and, toward the end of his career, an opponent of the New Deal. He fought internationalism and spent the last 28 years of his life in the U.S. Senate seeking to keep his country out of foreign entanglements.

The son of Lawrence Grove Johnson and Anne Williamson de Montfredy Johnson, Hiram was born on September 2, 1866, in Sacramento, California, as the third of five children. His father Grove was a lawyer who served for short periods of time in the California state senate and later in its house of representatives. Grove Johnson's reforming instincts brought him to the Republican Party, where he supported such causes as temperance, free textbooks, compulsory education, and women's rights. Hiram Johnson graduated from high school in 1882 at age 16 as class valedictorian and entered the University of California at Berkeley two years later. He left the university early to marry Minnie McNeal, the daughter of a carpenter and contractor. The couple had two sons, Hiram, Jr., and Archibald. Hiram Sr., read law in his father's office and joined the family firm.

Although Johnson revealed little inclination for following his father into politics, he became Sacramento city attorney in 1900. In 1902, he moved to San Francisco to practice law with his brother Albert; and two years later, he joined the team prosecuting former political boss Abraham Ruef and other city officials for bribery and graft. With this record, he arrived at the forefront of state reform politics, and he ran for the governorship as a Republican in 1910. Johnson won the election and served for six years, becoming the first governor in state history to be reelected. As governor, he supported a series of progressive reforms including railroad regulation, a workers' compensation law, and the popular election of senators, and helped frame constitutional amendments for woman suffrage. In 1913, in an act reflecting the racial hostility of his day, he signed

a bill denying Japanese immigrants the right to own agricultural land in California. In 1911 Johnson helped to form the National Progressive Republican League; and in 1912, he was nominated on the PROGRESSIVE PARTY ticket as THEODORE ROOSEVELT's vice presidential running mate.

In 1916 Johnson ran for the U.S. Senate on the Republican ticket. Reelected to that office four more times, he served a total of 28 years in Congress. The spring he began serving in the Senate, the United States declared war on Germany. Informally, Johnson was opposed to the war, and he objected when his own son volunteered for the army. At the same time, as senator, Johnson publicly supported the nation's war effort. After the war, he became an outspoken critic of the LEAGUE OF NATIONS and became one of the "irreconcilables" who opposed ratifying the TREATY OF VERSAILLES. An isolationist by inclination, Johnson fought against U.S. participation in the World Court, worked to stave off American intervention in the growing crisis in Europe in the 1930s, and voted against the United States joining the United Nations at the end of his long career. Johnson also worked for farm legislation, supporting the McNARY-HAUGEN FARM BILL and sponsored the act in Congress that created Hoover Dam on the Colorado River.

**Johnson, Jack** (1878–1946) *heavyweight boxing champion*

Born in Galveston, Texas, in 1878, Jack Johnson was the first African-American heavyweight boxing champion in U.S. history. He is still considered by many to be among the most gifted heavyweights ever to enter the ring. Johnson took up boxing relatively late, but he quickly gained a reputation as a fearless fighter. In excellent physical condition, he turned professional in 1897. Remarkably quick for a heavyweight, Johnson had great strength inside the ring. By 1903 he was considered to be among the top fighters in the country; but many in the profession, including the two most dominant heavyweights, John L. Sullivan and Jim Jeffries, refused to give the African-American boxer a shot at the heavyweight title. While he waited for a chance at the heavyweight crown, Johnson defeated another top-ranked African-American fighter, Sam McVey, in 1904 in what many called the "Black Heavyweight Championship." Johnson was forced to wait five years for the opportunity to fight for the heavyweight crown. Finally in 1908 the reigning champion, Canadian Tommy Burns, agreed to fight Johnson in Sydney, Australia. Johnson won the fight handily and remained heavyweight champion until 1915.

Jack Johnson and James Jeffries in the World Championship battle, July 4, 1910 (*Library of Congress*)

The period during which Johnson was the reigning heavyweight champion was one of rampant racism in America. Jim Crow laws and social custom had established racial SEGREGATION as common practice in both North and South, and African Americans faced systematic discrimination, loss of the right to vote, and racial violence. In the face of widely accepted beliefs of African-American inferiority, Jack Johnson proudly asserted not only his equality but also his dominance over his white peers. His arrogance infuriated many white Americans. Refusing to retreat from the public spotlight, Johnson was highly visible and in many ways larger than life. He relished his role as hero in the African-American community. In response, many white boxing fans, managers, promoters, and reporters were desperate for someone to “put Johnson back in his place.” Author Jack London put out a call for a “Great White Hope” to defeat Johnson. In 1910 London and others convinced former heavyweight champion Jim Jeffries to come out of retirement for a July 4 fight for a record prize

of \$100,000. Johnson, who was at the peak of his career, put on a brilliant boxing display and knocked Jeffries out in the 15th round. News of Johnson’s victory was greeted with enthusiastic celebrations in African-American communities throughout the country.

As champion, and for the rest of his life, Johnson disregarded the social conventions of his day. Bold, outspoken, and proud, he infuriated white America by his two marriages to white women. In 1912, Johnson was charged and convicted of violating the MANN ACT, which prohibited an individual from transporting a woman across state lines for “immoral purposes.” The crime Johnson committed was that he and his future wife, Lucille Cameron, traveled across state lines together. In order to avoid imprisonment, Johnson fled the country and moved to Paris. While in Paris, the Champ successfully defended his title three times. He eventually lost the heavyweight title to Jess Willard in a controversial bout in Havana, Cuba, in 1915. At the time and ever since, Johnson and many of his

supporters claimed that he threw the fight in an attempt to have his prison sentence overturned. Whether or not Johnson intentionally lost the fight, the charges were not dropped. Johnson returned to the United States in 1920 and served a one-year prison sentence in Leavenworth, Kansas. Even after his retirement from boxing in the early 1920s, he remained a prominent figure, appearing in VAUDEVILLE acts and operating several businesses until he died in a car accident in 1946.

### Johnson, Tom Loftin (1854–1911) *politician*

Early in the 20th century, large cities faced the need for reform. Garbage wasn't picked up on time; streetcar companies refused to improve lines; prostitution and crime seemed out of control; and bribery and graft were the only way to make the wheels turn. Journalist LINCOLN STEFFENS spoke to these problems in his book, *The Shame of the Cities*; another response was the URBAN REFORM movement led by a group of exceptional mayors, including Hazen Pingree of Detroit, Samuel "Golden Rule" Jones of Cincinnati, and Tom Johnson of Cleveland.

Tom Loftin Johnson was born in Blue Spring, Kentucky, on July 18, 1854. The son of Helen Loftin and Albert W. Johnson, a failed planter-turned-businessman, Tom Johnson had little formal schooling. He began working at an early age. When he turned 15, wealthy relatives purchased the smallest of three streetcar lines in Louisville and hired him as office clerk and, four years later, superintendent of the line. In 1874, Johnson married his cousin, Maggie J. Johnson. The couple had two children—Loftin and Elizabeth.

With good mechanical aptitude and a knack for invention, Johnson became an engineer-entrepreneur in the booming streetcar business. He began to invest in streetcar lines himself, buying his first line in Indianapolis in 1876. Although the line had snarled finances, Johnson helped turn the company around and sold his shares for \$800,000 a few years later. While he bought shares in streetcar lines in other cities, he made his largest investment in Cleveland, where his company eventually controlled 60 percent of the streetcar lines in the city.

Johnson's fascination with the working of streetcar lines led to his invention of mechanical improvements for streetcars and their lines. He invented and began to manufacture a streetcar pay box and the girder groove rail, which was a metal electric streetcar rail. In addition, he improved upon

designs for, or invented, curved tracks, crossovers, frogs, and special track devices. To manufacture the steel streetcar rails, Johnson founded the Johnson Company in 1883 in Johnstown, Pennsylvania. He also established the Johnson Electric Company in Cleveland to repair steel motors. In the 1880s and early 1890s, newcomers were able to enter and quickly dominate the business of parts and motor manufacture and to buy streetcar franchises. By the late 1890s, however, competition in steel manufacturing and urban transport began to crowd out entrepreneurs like Johnson. He eventually sold his shares in both of his companies to devote himself to reform.

Having become a member of an elite business class, Tom Johnson discovered the problems of poverty, taxes, and cities through the writings of Henry George. George's *Progress and Poverty* influenced reformers for a generation. In George's thinking, it was speculation on undeveloped land, and the concentration of land in the hands of the few, that was at the root of social ills in the United States. Using his wealth to further the cause, Johnson supported George's political campaigns and a number of single-tax journals.

George's ideas about tax reform helped inspire Johnson into running for elective office. He ran for Congress and served two terms (1891–95) in the House of Representatives, where he was known for his single-tax oratory. In his next move, he ran for and won election as mayor of Cleveland, where he served as mayor from 1901 to 1910. Johnson called for tax reform in scientific tax assessments and equitable property taxes. He also campaigned and fought for centralized city government, municipal ownership of streetcars and utilities, lower streetcar fares, city beautification, and local prison reform. Johnson was bankrupt by 1908; under a flurry of charges of corruption, he lost the mayoral election in 1909. He died in 1911 at age 57.

### Jones Act (1916)

Formally known as the Philippine Autonomy Act, the Jones Act declared the American intention to grant independence to the Philippine Islands, which the United States had acquired as a territory after the Spanish-American War. Despite the Philippine Insurrection against colonial rule under Filipino leader EMILIO AGUINALDO and the well-intentioned efforts of congressional sponsors, the Philippine Islands remained under military government. Replacing the Philippine Organic Act of 1902, which created the first

American administration, the Jones Act became the first law to establish Philippine autonomy. It also asserted that Philippine independence would occur “as soon as a stable government [could] be established,” but the United States retained the power to determine whether such a government existed. While the Jones Act sought to provide home rule for the Philippines, it reasserted the sovereign rights and privileges of the United States over the islands.

In addition to the question of national autonomy, the Jones Act created a new government structure in the Philippines. It added a popularly elected Philippine Senate to the legislature to replace the Philippine Commission, which formerly had been appointed by the American president. While the appointed governor general of the Philippines had veto power over the legislature, the Jones Act made significant progress toward Philippine self-government and extended the reforms instituted by the current governor general, Francis Burton Harrison. Promoting cooperation between Americans and Filipinos, Harrison transformed the government of the islands by replacing American officials with Filipino civil servants. Between 1913 and 1921, Filipino administrators came to dominate the civil service. The “colonial government of Americans aided by Filipinos” became, according to Harrison’s critics, a “catpaw and plaything” of Filipino nationalists. At the same time, the president of the United States continued to appoint the governor general and Philippine Supreme Court justices as well.

The Jones Act was only one stage in the long struggle for Philippine independence. There were several subsequent efforts to grant independence to the islands. In 1912, William Atkinson Jones, Democratic congressman from Virginia, introduced a bill to grant the Philippines autonomy followed by independence in 1921. The bill failed in the House. Two years later, a new bill set no specific timetable for independence and integrated several amendments; it also failed. Only in 1916 did CONGRESS approve the Jones Act, which President WOODROW WILSON signed into law.

The Philippines remained under the government established by the Jones Act until 1934, when Congress established the Commonwealth of the Philippines, effective in 1935. The Philippines did not achieve independence until after World War II.

### **Jones Act (Jones-Shafroth Act) (1917)**

The Jones Act of 1917, sometimes known as the Jones-Shafroth Act, granted American citizenship to inhabitants of Puerto Rico and made significant changes in how Puerto

Rico was governed. The United States had acquired the island of Puerto Rico after the Spanish-American War, as part of Spain’s treaty obligations. From the signing of the peace treaty until 1917, Puerto Rico was an American territorial possession. Its inhabitants, if they did not have pre-existing status as citizens of another nation, were citizens of Puerto Rico and not of the United States, as specified under the Organic Act of Puerto Rico, known as the FORAKER ACT. Puerto Rican residents did not possess the rights, protections, and obligations of American citizens under the U.S. Constitution, nor was the island integrated into the United States in any meaningful way.

In part, the special status of Puerto Rico, the Philippines, and other territories that the United States acquired in the late 19th century was due to the racial and cultural differences between the majority population in the United States and the nation’s new protectorates. Some Americans had opposed the war with Spain precisely because an American victory threatened to undermine the country’s predominantly Anglo-American culture. Those who saw immigrants from southern and eastern Europe as a menace to the society had similar misgivings about bringing new lands and peoples under American governance.

WORLD WAR I helped to change this thinking. Although the United States remained neutral in the first few years of the war, many believed that the country would be drawn into the European conflict and that it was important to institute new measures to prepare the nation for war. Among these measures were the PREPAREDNESS movement, campaigns for AMERICANIZATION, and the introduction of CONSCRIPTION in 1917. Among the other measures, the Jones-Shafroth Act opened the door both to closer relations between the American government and Puerto Rico and made men in Puerto Rico eligible for the draft. Nearly 20,000 would serve in the AMERICAN EXPEDITIONARY FORCE during the war.

The Jones Act also moved the Puerto Rican government closer to the model of American states. The law established a popularly elected legislature with a Senate and House of Representatives. While the appointed governor could veto legislative bills, the legislature could override his veto with a two-thirds majority. The president of the United States had final decision-making power, and the president similarly appointed the governor, the attorney general, and the governor’s cabinet. A popularly elected but nonvoting resident commissioner represented Puerto Rico in the U.S. House of Representatives. The federal government maintained significant control over the Puerto Rican economy and government services. The Jones Act remained in force, with minor revisions, until 1952, when Puerto Rico became a commonwealth and developed its own constitution.

Sparrow, *The Insular Cases and the Emergence of American Empire* (Lawrence: University of Kansas Press, 2006).

### Joplin, Scott (1868–1917) *pianist and composer*

Called “the King of Ragtime,” Scott Joplin composed many of the most popular as well as artistically realized piano rags. He was born in Texarkana, Texas, on November 24, 1868. His father, Giles Joplin, was a former slave, and his mother, Florence Givens, had been free from birth. At an early age, Joplin showed unusual ability at the piano. By the time he was 11, he had come to the attention of a local, German music teacher, who offered him lessons free of charge. This teacher taught Joplin to read music, and the elements of music theory, and introduced him to the works of the great European composers.

At about age 14, Joplin began what was probably the most significant part of his music education. He became an itinerant pianist employed in the honky-tonk and red-light districts of towns and cities of the Mississippi Valley. In the course of the next three years, he met many musicians, both black and white, and became exposed to the evolving ragtime style of music popular in such establishments. This was a pivotal era in American musical history, as it was the first time black and white musicians were meeting as musical equals. The emerging style borrowed its form and harmonic structure from white European culture, but the essential polyrhythms came from black African culture.

In 1885, Joplin arrived in St. Louis, which served as his base for the next 10 years. He formed a small orchestra that played in Chicago during the World’s Columbian Exposition in 1893. After hours, he was able to hear and play for some of the country’s best ragtime pianists. He settled in Sedalia, Missouri, around 1895, and in 1895 and 1896 published his first music. In 1897, Joplin enrolled in the George R. Smith College for Negroes in Sedalia, where he studied harmony and composition.

In 1899, John Stark published “The Maple Leaf Rag,” the composition that was to earn Joplin the nickname “King of Ragtime.” Stark, the white owner of a local music store in Sedalia, purchased it for \$50 with an arrangement for continuing royalties to Joplin. This arrangement, unusually fair for the time, soon provided Joplin with financial stability, as “The Maple Leaf Rag” was a national hit within six months. Joplin was now able to concentrate on composition. His first large-scale composition, *The Ragtime Dance*, was completed and performed in Sedalia in 1899. This work consisted of choreographed dance numbers with

sung narration. Although published by Stark in 1902, the score is now lost.

With his publishing business flourishing, Stark moved it to St. Louis in 1900, and Joplin, recently married to Belle Hayden, soon followed. The next six years saw Stark’s publication of many Joplin rags, including “The Entertainer,” “Elite Syncopations,” and “The Cascades.” Joplin also concentrated on his first ragtime opera, *A Guest of Honor*. This work (now lost) was completed and presumably performed in St. Louis around 1903.

In 1904 Stark moved his publishing business to New York, and Joplin, after separating from his wife, also settled in New York in 1907. In 1909 he married his second wife, Lottie Stokes. Joplin continued composing rags and teaching, but he put most of his energy into the composition of his second opera, *Treemonisha*, a work that consumed him for the rest of his life. *Treemonisha* is scored for 11 voices and chorus with piano accompaniment. The story has the character of a fable, and the music draws from African-American folk tradition as well as ragtime. Joplin and Stark parted ways, leaving Joplin to publish the score of *Treemonisha* in 1911 at his own expense. In the hope of attracting backers for a full production, he put together a performance in a hall in Harlem in 1915. The performance was a failure, and Joplin was devastated. The final years of his life were marked by depression and illness. In 1916, Joplin was committed to Manhattan State Hospital on Ward’s Island, and on April 1, 1917, he died there.

Joplin’s music enjoyed a revival in the early 1970s. *Treemonisha* received its first performance in Atlanta in 1972 and its first full-scale production by the Houston Grand Opera in 1975. His piano rags have found a secure place in the modern repertoire, equally at home in movie soundtracks and on the concert stage.

### journalism

The most important trend in journalism in the period between 1900 and 1930 was the maturing of what was called “the new journalism” or, more critically, “yellow journalism.” At a time when newspapers became large businesses, owners and editors sought new ways to attract the reading public and to capture subscribers from their competitors. They sought the profits not only from increased subscriptions but also from ADVERTISING revenues based on circulation. City newspapers like the *New York World* and the *San Francisco Chronicle* used innovative newspaper

formats that relied on larger headlines, more graphics, and comic strips with colored ink to attract readers. Sensationalist reporting on murders, scandals, and campaigns drew new groups of subscribers. Working-class men and women, especially immigrants with limited English, became devoted followers of the major city dailies, which used bold print, plentiful illustration, and clear language to convey the news.

The Progressive Era was the Age of the Reporter. Previously newspapers had published largely unsigned articles; even editorial matters were often the anonymous voice of the owner/editor or that of a columnist using a pen name. During the 1890s, the journalistic wars between newspaper giants Joseph Pulitzer and WILLIAM RANDOLPH HEARST gave new weight to the personality of the star reporter. One new practice was that of stunt reporting. Posing as mental patients, workers, and band members, stunt reporters investigated government offices, factories, asylums, and prisons. Hundreds of newspapers around the country followed this lead and employed reporters to investigate conditions in their cities. Stunt journalism helped to emphasize the individual reporter at work while routine reporting required a team effort. Writing up a single murder investigation could take up to eight writers and editors, each of whom specialized in their work.

In contrast to sensational news stories were the new standards of objectivity, with which *New York Times* editor Adolph Ochs was associated. Directing his paper at an educated middle-class audience, he defined journalism differently from his mass circulation rivals, the *New York World* and the *New York Journal*. “Facts” rather than “stories” were the key. Ochs also altered the newspaper’s appearance and expanded wireless service. Reinvestment of profits into new buildings, state-of-the-art presses, and professional staff placed the *Times* at the forefront of newspaper journalism. From 1896, when Ochs took over the newspaper, to 1921, when he retired, the circulation of the *New York Times* increased from 100,000 to 330,000 daily and 500,000 Sunday readers.

The demand for investigative reporting to bolster newspaper circulation gave rise to another development. In the context of PROGRESSIVISM, mass circulation newspapers began conducting their own investigations of private and public misdeeds. In 1905, seeking to launch yet another challenge against its rivals, the *New York World* began to investigate the Equitable Life Insurance Society. The ensuing public furor over the ways in which insurance companies “gambled” with their shareholders’ funds spiraled into a major state investigation and then state regulation of the industry. Not to be outdone, Hearst’s *Journal American* directed its attention to a new domestic agenda. Charging that “criminal trusts” were undermining democracy, Hearst’s editorial page showed its colors in attacking

big business and urging the adoption of a graduated income tax, public ownership of utilities, DIRECT ELECTION OF SENATORS, and improvement of the public schools. At the same time, Hearst expanded his empire with the acquisition of newspapers in major cities. By 1930, his claim to be the “people’s champion” echoed in 26 daily newspapers and 17 Sunday newspapers in 28 cities.

The investigative efforts of big city dailies also inspired a new generation of journalists. Called MUCKRAKERS, the reporters took on a range of social and political problems as the target for investigation. The central themes of their work were the growing concentration of corporate wealth, political corruption, and the deplorable conditions of poverty and disease in the new industrial society—leitmotifs for both the new journalism and progressive reform as a whole. Investigative reporting soon spread to mass-market magazines like *McClure’s*, *Cosmopolitan*, and *Collier’s*, which already had expanded their circulation in the 1890s. By 1900, their expanded subscriber base ensured that the “literature of exposure” had a wide audience. Even the stalwart *Ladies’ Home Journal* got in on the act by attacking the patent medicine trade. Talented muckraking writers such as Lincoln Steffens, IDA TARBELL, Ray Stannard Baker, and UPTON SINCLAIR became household names. Investigating big city bosses, conditions in meatpacking plants, and corporate monopolies, the muckrakers built support for progressive reform. At the same time, the magazines for which they wrote saw subscriptions increase substantially.

The new environment of newspaper and magazine publishing opened the door for qualitative changes. Newspapers became big business in the period, and their profits encouraged the founding of many new city and country newspapers. In the decade between 1900 and 1910, the number of dailies in the United States increased from 1,967 to 2,600. There were 14,000 general circulation weeklies. The new business of advertising stimulated the expansion of newspapers across the country. Between 1915 and 1929, advertising revenues nearly tripled from \$275 million to \$800 million annually. Revenues often were reinvested in the industry as newspapers and journals acquired high-speed and color presses, typesetting machines, and engraving plants, all of which required new infusions of capital. Competitive pressure from city dailies and standardization of news through services like the United Press Association, the Newspaper Enterprise Association, United Features, and Science Service Syndicate cost many country weeklies their subscriber base.

In smaller industrial cities, Edward W. Scripps founded a new chain of low-priced afternoon newspapers designed for the mass of readers. Beginning with the *St. Louis Chronicle*, Scripps invested small sums of capital to acquire local newspapers such as the *Detroit News*, *Cleveland Press*, and *Cincinnati Post*, extending the chain to 14

papers by 1911. The newspapers were, for the most part, well written in simple but direct prose. Small in size, they printed short news and human interest stories and local reform crusades. Dependent on circulation revenue and thus on general reader support, Scripps embraced a progressive agenda of support for public ownership of utilities and urban reform; he also backed labor unions. By the 1920s, the Scripps-Howard chain had become one of the largest in the country.

The advent of WORLD WAR I had a tremendous impact on journalism in the United States and abroad. Not surprisingly, the war became a primary focus for newspaper coverage even before the United States entered the war. Wartime government censorship, paper rationing, and taxes fundamentally changed the political economy of newspaper and journal publishing. First, major newspapers such as the *Chicago Daily News*, the *New York Times*, and the *New York Sun* created news services and established European bureaus to cover the war. At the front line, reporters were confronted with severe restrictions on their access to military information, which often was released only as official communiqués from government offices. They were largely restricted to feature stories from the frontlines, and even those stories, sent by either wireless or mail, faced government censors. Further, the WAR REVENUE ACT of 1917 and the TRADING WITH THE ENEMY ACT of the same year adversely affected newspapers and journals by introducing new costs and restrictions. The War Revenue Act raised postal rates every year for four years beginning in July 1918. The consequence of raising the rates was to undermine the financial base of small newspapers and to shift delivery and distribution of news out of the postal service. The Trading with the Enemy Act was somewhat more insidious. It required all foreign-language periodicals to translate their materials and submit them to a censor before publication. Hundreds of journals went out of print as a result. The same act allowed the postal inspector to refuse mailing permits to journals that voiced opposition to American intervention in the war or otherwise published radical sentiments. Finally, wartime inflation and escalating prices on paper, ink, linotype metal, and machinery put many publications out of business. The cost of paper alone tripled in the years between 1916 and 1921.

The economic pressures of the war and the suppression of foreign language newspapers furthered the movement toward consolidation of newspapers in the 1920s. The number of newspapers had begun to decline from its peak of 2,600 in 1910 to 2,042 in 1920 and 1,942 in 1930, a net loss of 258 newspapers. In the four years after World War I, more than 100 dailies were lost. At the same time, however, newspapers flourished in the more than 70 percent of cities and 80 percent of small towns that had a single newspaper.

Circulation grew from 27.5 million in 1910 to 40 million in 1930.

In the arena of magazine publishing, there were similar stories. By 1900, there were over 3,500 magazines read by 65 million readers. The real growth in magazine readership, however, was still to come. In the 1920s, new mass-market magazines captured the readership of older dime novels. These magazines focused on real-life stories and confessional articles such as "What I Told My Daughter the Night before Her Marriage," "Indolent Kisses," and "The Confessions of a Chorus Girl." The increasing popularity of the movies encouraged star journals as well. *True Confessions*, *Western Stories*, and *Detective Story* drew a huge readership. *True Story*, which Bernarr Macfadden began publishing in 1919, had more than 300,000 readers by 1923. In 1924, the number rose to 828,000 and to almost two million in 1926. Other magazines in such new areas as muscle-building (Macfadden's *Physical Culture* and *Health and Body*) opened the door for ever greater specialization. There was a corresponding move for magazine consolidation as well.

Magazine publishers also helped introduce tabloid journalism to New York City. Modeled on the *London Daily Mirror*, newspapers such as Macfadden's *Daily Graphic*, the *Daily Mirror*, and the *New York Daily News* began in 1920 to compete with older, more established newspapers. Their small size made them easier to read on crowded streetcars, but it was their news content that had a mass appeal. Instigating a new wave of sensationalist reporting called both "jazz" and "gutter" journalism, the *Daily Graphic* tapped such society scandals as the Fatty Arbuckle murder trial and the Kip Rhinelander interracial divorce case. Their graphic coverage of sex and crime scandals provoked the wrath of the Society for the Suppression of Vice, which brought Macfadden and his editor, Emile Gauveau, into court. Tabloids also directed new attention to Hollywood and sports celebrities, such as Babe Ruth and Knute Rockne. Circulation increased from 400,000 in 1922 to nearly a million readers in 1925. At the same time, however, the failure of the tabloids to attract sufficient advertising revenue caused the *Mirror* and the *Graphic* to go out of print in the 1930s; only the *Daily News* survived.

The emergence of RADIO brought journalism to a new medium. Although radio stations were still small and had a limited audience, radio introduced amateur news coverage of elections as early as 1916. In 1920, stations KDKA in East Pittsburgh and WWJ in Detroit broadcast the national election returns. Regular news coverage was introduced in New York on stations WNYC and WEAF. Large city newspapers invested in the new medium and acquired stations to broadcast coverage derived from their print reports. Despite initial protest, the Associated Press and the United Press formalized the use of news services on radio by creating two daily broadcast reports in 1928. This development

coincided with the creation of national radio networks to distribute news and sports coverage. NBC emerged in 1926, and CBS in 1928. Throughout the period, there was at least the urge to distinguish radio news, which presumed equal access and neutrality, from the partisanship of newspaper reporting. The Radio Act of 1927, however, brought little regulation to news programs, and news stories continued to focus on political reporting that narrowly covered the two major political parties at their party conventions and national political addresses.

Despite the growth of radio news, mass-circulation newspapers reached new heights in 1930. The Hearst newspaper chain, which had begun modestly with two major city dailies, now included 26 dailies and 17 Sunday newspapers in 28 cities. The advent of radio broadcast news, however, suggested that there was a qualitatively different future ahead. Broadcast journalism on the radio and, within a few

decades, on television began to supplement and then dominate how average citizens learned the news of their community, country, and world. The medium of broadcasting altered fundamentally the subject and approach of journalism and the definition of what was newsworthy.

## **Keating-Owen Act** (1916)

A federal statute that outlawed the transportation of goods produced by CHILD LABOR, the Keating-Owen Act was the culmination of a Progressive Era movement to outlaw child labor. The act passed Congress on September 1, 1916, and went into effect on September 1, 1917. Before it could have much of an effect, however, it was challenged in federal court and ruled unconstitutional by the U.S. Supreme Court in June 1918.

Progressive reformers believed that child labor was the greatest evil threatening America's children and thus the future of America. In 1900, 18 percent of children aged 10 to 15 worked, many of them in factories, mines, and mills. The millions of children working in dangerous conditions attracted the efforts of numerous reformers. Opponents of child labor initially sought to legislate against it in the states, but they realized that many states were unwilling to pass laws because their industries were dependent on the labor of children. Child labor law advocates therefore decided that federal legislation was necessary. The federal government did not, however, have the explicit constitutional power to prohibit child labor. Still, proponents of child labor laws believed that the federal government had the right to restrict interstate transport of goods produced by child laborers. By restricting the transport of these goods, the Keating-Owen Act effectively set national guidelines for child labor. It outlawed the labor of children under 14 years of age in factories, mills, and canneries, and under 16 years in mines and quarries. It also prohibited workers under 16 from working more than eight hours a day.

Opposition to the bill in Congress came from the states that employed more children than all others combined, the southern textile-producing states and Pennsylvania. Congressmen from these states argued that child labor was good for all involved. There were not enough schools, employers claimed, to handle all the children who would be thrown out of work by child labor laws. Work was therefore important in preventing delinquency by keeping children

off the streets. It was also important for children to learn work skills early in life that would prepare them for careers as factory operatives. Opponents also claimed that workers over the age of 16 were too slow and clumsy and that only the nimble fingers of a child could handle some jobs. Prohibiting child labor would rob widow mothers of their sole means of support and restrict the children's inherent right to work. These arguments were ineffective, and the Keating-Owen Act passed by a vote of 343 to 46 in the House of Representatives and in the Senate by 52 to 12, with 32 abstentions.

Almost immediately upon passage, the Keating-Owen Act was challenged in the federal courts. In a case brought by the executive committee of the Southern Cotton Manufacturers, a federal judge ruled the act unconstitutional. The case was then appealed to the U.S. Supreme Court. In *Hammer v. Dagenhart*, the Supreme Court judges ruled five to four that the law was unconstitutional. They argued that it was an unwarranted exercise of the federal government power to regulate commerce and an invasion of state's rights. In the nine months in which it was in effect, the Keating-Owen Act freed 150,000 children from work in mines, factories, and mills. More importantly, it acted as a model for state legislation against child labor and helped spur efforts in many states to limit the labor of children under the age of 16.

**Kelley, Florence** (1859–1932) *social reformer, labor activist*

One of the leading figures in Progressive Era reform, Florence Kelley dedicated her life to improving the lives of

working men, women, and children. Born near Philadelphia, Pennsylvania, Kelley graduated from Cornell University in 1882. After the University of Pennsylvania refused to admit her to graduate study because she was a woman, Kelley began her career in reform. She joined the Philadelphia Woman's Club and established and taught at an evening school for working women and children. On an 1883 European trip, Kelley discovered that the University of Zurich allowed women to earn graduate degrees, and she enrolled. While in Zurich, she became a socialist and translated several works of Karl Marx and Frederick Engels into English. She also met her future husband, a Russian medical student, Lazare Wischnewtzky. The two married in 1884 and in 1886 moved to New York City. In 1891, in response to her husband's physical abuse, Kelley took their three children and moved to Illinois. She moved there both because of Illinois' lenient divorce laws and Chicago's reputation for social reform.

Upon coming to Chicago, Kelley joined JANE ADDAMS at Hull-House and took up residence in 1891. She took charge of the Hull-House Women's Labor Bureau and convinced the Illinois Bureau of Labor Statistics to hire her to investigate the conditions in Chicago's sweatshops. Her work led to further appointments as an investigator for the federal commissioner of labor to study Chicago's slums. Kelley uncovered the appalling conditions under which workers lived, and her findings spurred a movement to pass labor laws in Illinois. As a result of her investigation, the state of Illinois passed laws restricting CHILD LABOR, limiting the working hours of women, and regulating the conditions in sweatshops. In 1893, Kelley became Illinois' first chief factory inspector. In 1897 the governor of Illinois replaced her with a patronage appointment, putting her out of work.

Kelley became the executive secretary of the National Consumers League, a position she held until her death. As league secretary, she lobbied on behalf of protective labor legislation for women and children. She helped establish 64 consumers' leagues throughout the United States and traveled promoting policies agreed upon by the national board. Working with the Oregon consumers' league, Kelley helped successfully defend the state's 10-hour working-day legislation for women in the 1908 *MULLER V. OREGON* case. Under her leadership, the National Consumers League became the most effective lobbying group for protective labor legislation for women and children. She also continued to campaign against child labor in a number of ways. A founder of the National Child Labor Committee in 1904, Kelley made the creation of the CHILDREN'S BUREAU one of her top priorities. The effort was successful in 1912. Kelley was also instrumental in 1921 in the passage of the SHEPPARD-TOWNER ACT. She died in 1932.

### **Kellogg-Briand Treaty (Kellogg-Briand Pact; Pact of Paris) (1928)**

A product of the interwar peace movement, the Kellogg-Briand Pact was a 1928 agreement among several nations to seek to stop war. In 1927 James T. Shotwell, a Columbia University professor and trustee of the CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE, visited French foreign minister Aristide Briand to lobby for a formal repudiation of war by the United States and France. When the French refused to attend the Geneva Naval Conference, Briand attempted to mollify American concerns that the French might be engaging in an arms race by sending a draft of a treaty to Washington on June 20, 1927, along the lines that Shotwell had suggested. Worried about the revival of German militarism, the French hoped to forge an alliance with the United States as a security measure against their historic enemy.

America's secretary of state Frank Kellogg proposed an alternative to Briand's alliance, a multilateral treaty that outlawed war. Eventually 62 nations signed the treaty in Paris in 1928. The nations agreed to "condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national policy." The signatories, however, watered down the treaty by attaching amendments refusing to outlaw, for example, wars of self-defense. The U.S. Senate attached an amendment to the pact that allowed for the use of force to uphold the Monroe Doctrine as well as to protect national interest or honor. Perhaps more troubling was the fact that the U.S. Congress passed legislation to increase its navy at the same time that it formally renounced war in the Kellogg-Briand Treaty. On the same day that the Senate approved the treaty 85-1, it appropriated funds for 15 new cruisers.

Furthermore, the Kellogg-Briand Treaty had no mechanism for enforcement. Instead, according to Kellogg, it relied on "moral force." The treaty was in fact only a statement of principle that required no sacrifices or responsibilities. It did not provide a sense of security to its signatories, nor did many peace advocates believe that the treaty guaranteed a peaceful world. American statesmen and peace advocates who supported the pact saw it as only a first step in a longer process toward a peaceful world. It was viewed more or less as a tool to educate the public about the costs

of war. However, it proved useful after World War II, when the treaty was revived by the Allies to punish German leaders for war crimes at the Nuremberg Trials.

### Kelly Air Mail Act (1925)

Also known as the Contract Air Mail Act, the Kelly Air Mail Act established a competitive bidding system for private airlines to provide mail transport for the U.S. Post Office in 1925. It was the first major step toward the creation of a private U.S. airline industry, and was named after its chief sponsor, Representative Clyde Kelly of Pennsylvania. Winners of the five initial contracts were National Air Transport (Curtiss Aeroplane Company), Varney Airlines, Western Air Express, Colonial Air Transport, and Robertson Aircraft Corporation. Various air transport holding companies soon appeared, including American Airways, which later transformed into American Airlines, and United Aircraft, which later became United Airlines. By the mid-1920s, the Post Office mail fleet was flying 2.5 million miles and delivering 14 million letters annually. The formation of a mail transport system by the Post Office Department further spurred the development of the air transportation industry. Once the Kelly Air Mail Act was passed, the private carriers who provided air transport for the Post Office expanded into carrying other forms of cargo, and eventually passengers.

The same year Congress passed the Kelly Air Mail Act, President CALVIN COOLIDGE formed a board to recommend a national aviation policy. Dwight Morrow, the future father-in-law of CHARLES LINDBERGH, was named chairman. The report advised that the government set standards for the air transport industry. It argued that the military should not be involved. The Air Commerce Act of 1926 provided for federal regulation of air traffic rules. The legislation authorized the secretary of commerce to designate air routes, develop air navigation systems, license pilots and aircraft, and investigate accidents. Congress amended the Kelly Act by simplifying the payment system. Pilots would get paid by the weight of the mail, not as a percentage of postage paid.

As the industry grew, the Post Office increasingly had influence over the airline industry and limited the number of carriers that were granted the coveted mail transport

contracts. These practices were ruled anticompetitive, and the industry once again opened up to a competitive bidding system, until 1938, when the Civil Aeronautics Authority was developed.

### Ku Klux Klan

The original Ku Klux Klan emerged in the wake of the Civil War. The primary emphasis of the organization was to reassert the racial caste system that its followers believed was in jeopardy with the end of slavery. Attempting to “redeem” the South, southerners formed paramilitary groups dedicated to suppressing southern African Americans. Organized in 1866, the original incarnation of the Klan was led by former Confederate general Nathan Bedford Forrest. Forrest and other leaders of this quasi-secret organization devised elaborate rituals in order to unify its members and create an aura of mystique and passion. The hoods and robes were central to the organization’s identity, but even more important were the midnight rides. These rides became the defining element of the organization. They not only spread fear and terror throughout the South, but also helped to unite the Klansmen. When Reconstruction ended, however, the midnight rides lost their functionality. Soon after, the perceived need for the Klan declined. Within five years, the Klan ceased to exist as a coherent organization.

The Klan lay dormant for nearly a half-century before it reemerged in a position of even greater influence than before. What began as a small meeting of white supremacists on Stone Mountain in Georgia in 1915 provided the nucleus for the resurgence of the organization. The new Klan grew slowly at first, but soon it became the most influential organization in the South. The premiere of D. W. GRIFFITH’s film, *BIRTH OF A NATION*, was a seminal event in the Klan’s reemergence. Adapted from Thomas Dixon’s racist novel, *The Clansman*, the film portrayed the Klan as a chivalrous organization of the post–Civil War era that was both necessary and just. Its purpose was supposedly to save southern society and southern institutions from the ignorance and greed of blacks and northerners. *Birth of a Nation*, which opened in Atlanta not far from Stone Mountain, provided a base for the revived Klan. The movie’s immense popularity helped to give legitimacy to the organization’s past.

The new Klan attained a level of acceptance that the previous Klan had coveted. With acceptance came

Parade of the Ku Klux Klan through counties in Virginia (*Library of Congress*)

numbers. By the middle of the 1920s, nearly 4 million men and women were members of the revitalized organization. In the beginning, the new Klan was merely a new version of the old organization. Its primary goal was to subordinate southern blacks. But due to social changes brought by new immigration and technology, the Klan adopted a broader vision. Klan members claimed to be against anything and everything that was contrary to “America” and directed their venom toward Catholics, Jews, and recent immigrants. Klansmen viewed these minority groups as serious threats to the health and sanctity of the nation. While the promotion of racial hegemony remained central to the Klan’s image and philosophy throughout its second incarnation, race was soon subordinated to culture. Members of the Klan championed themselves as defenders not of a racial or caste system but of traditional values. This vision allowed the Klan to win the support of people who would not normally have supported it. New recruits saw modernization, not necessarily racial minorities, as a threat to their traditional ways of life. They flocked to the organization that they believed would defend their value system.

The new Klan expanded not only in membership and ideology but also geographically. For the first time since its

inception, it was no longer a predominantly southern organization. By the early 1920s, local Klan chapters were popping up throughout the United States. In Chicago alone, the Klan had several thousand members. Men and women from all parts of the country, from New York to California, flocked to the organization. A chapter was even established at Harvard University. The more cosmopolitan nature of the organization can be seen by its membership. During this era, the Klan attracted more members in Indianapolis than it did in Mississippi. Like its southern predecessor, moreover, the new Klan was a powerful political force. It controlled key branches of local government throughout the country. In Anaheim, California, for example, the Klan controlled the police, the city council, and other public offices.

The Klan reached its peak in the middle of the 1920s. It then declined as fast as it had emerged. After 1925, due to a series of power struggles and scandals, the Klan began to lose its following. Many of its members left the organization because they believed it was more concerned with making profits than defending their way of life. Still others believed that inefficient leadership was corrupting the Klan. The biggest blow to the organization, however, came from David Stephenson, head of the Indiana Klan. He

kidnapped his secretary and raped her. When she poisoned herself, he left her to die. This act challenged much of what the new Klan was claiming to be. It was difficult to tout the organization's position as a defender of traditional Christian morality when its leaders had such an appalling disrespect for these ideals. The organization faded into obscurity where it remained until its next incarnation.

### **labor and labor movement**

The nature of work, and the way in which workers responded to the challenges work presented, changed dramatically between 1900 and 1930. Prior to 1900, most American workers spent their days engaged in work that varied little from the time when the country had been founded. Farming, skilled craft work, domestic service, mining, and fishing typified the way in which most wage earners secured their livelihood. To be sure, some important changes had begun to change the nature of work. The post-Civil War industrial revolution and the influx of millions of immigrants increased the number and ethnic diversity of laborers and wage earners. Small- and large-scale factory production altered entire industries, such as tailoring. Where skilled craft workers had once produced hand-sewn, high-quality goods, by the 1880s skilled tailors had been replaced by semiskilled factory workers who were mass-producing inexpensive garments.

While few industries had been as thoroughly transformed as the tailoring industry, these changes had spread throughout much of the economy by 1900. Business innovators, such as JOHN D. ROCKEFELLER in oil, J. P. Morgan in banking, and Andrew Carnegie in steel, were determined to rationalize and control every aspect of their industries. Key features of this attempt to rationalize and modernize American industry included mass-producing goods, vertical and horizontal integration of production, scientific management, hiring an ethnically and racially diverse workforce, and efforts to replace skilled craft workers with unskilled or semi-skilled workers. Employer motivation was to monopolize control over an entire industry and maximize profits by mass-producing inexpensive goods and keeping labor costs as low as possible. Industrial corporations were joined in their efforts by small business owners. Together, employers large and small formed organizations such as the NATIONAL ASSOCIATION OF MANUFACTURERS, the American Anti-Boycott Association, and local chambers of commerce. Their ultimate goal was to structure their busi-

nesses and American industry to be more efficient, scientific, productive, and profitable.

Attempts to modernize American industry resulted in significant changes in the nature of work. Employers routinized the production process by mass-producing goods and introducing SCIENTIFIC MANAGEMENT to ensure greater productivity and control over the workforce. New management techniques included a specialized division of labor, employee training, creating sales and distribution departments, and more sophisticated methods of accounting and record keeping. One important consequence was the proliferation of middle managers, secretaries, college-educated professionals, and other white-collar occupations. Gradually, white-collar occupations became specialized and divided along gender lines. Middle-level managers, accountants, sales representatives, and technical experts were predominately male employees, while clerks, receptionists, secretaries, typists, and company nurses were typically female.

Working-class Americans responded to these changes in a number of ways. First, there was significant growth in the number of labor unions. Workers sought to gain greater control over their working conditions and improve their lives by forming unions for most of the 19th century. Their efforts met with mixed results; but by the end of the century, few American workers belonged to labor unions. In 1897, union membership in the United States stood at a paltry 447,000. Union membership remained low for a variety of reasons. Many employers, citing moral, philosophical, and financial objections, vigorously resisted labor unions. Employers opposed to unions hired ethnically and racially diverse workforces and then exploited divisions among workers to prevent them from forming unions. When strikes did occur, some employers hired replacement workers from other ethnic and racial communities. Employers also embarked on a prolonged attempt to replace relatively well-paid skilled workers with poorly paid unskilled or semiskilled workers. In other industries,

such as textiles and tailoring, women and children were hired to replace more highly paid male workers. Employers relied upon the nation's conservative legal and political environment to prevent workers from forming unions. Strikes, boycotts, and other forms of labor pressure were frequently undermined by court injunctions and decisions. For example, in 1908, the U.S. Supreme Court ruled in the *DANBURY HATTERS* case that the union's consumer boycott violated the Sherman Antitrust Act of 1890.

Prior to 1900, some union efforts had been successful. Although the 1890s witnessed several stunning defeats, such as the 1892 Homestead Strike and 1894 Pullman Strike, there was also substantial growth in union membership. Led by JOHN MITCHELL, the UNITED MINE WORKERS OF AMERICA (UMWA) formed in 1890 and grew steadily throughout the decade. Similarly, the much larger AMERICAN FEDERATION OF LABOR (AFL), led by Samuel Gompers, experienced steady gains in membership. As the largest labor union in the country, the conservative AFL built a solid foundation by focusing its efforts on recruiting skilled white craft workers. While the efforts of the AFL helped these skilled workers fend off attempts to lower their wages, it left the vast majority of American workers poorly paid and unorganized.

By 1900, proponents of NEW UNIONISM attempted to fill the void left by the AFL. Where the AFL had restricted its efforts to organizing only highly skilled workers, many

of the new unions attempted to organize workers throughout entire industries. One of the early examples was the UMWA. The UMWA attempted to organize mine workers regardless of their job classification within the industry. Other unions, such as the INDUSTRIAL WORKERS OF THE WORLD (IWW) and the WESTERN FEDERATION OF MINERS, went even further and attempted to organize workers throughout the entire country, regardless of their gender, race, ethnicity, or occupation.

These new semi-industrial unions, such as the UMWA, the INTERNATIONAL LADIES' GARMENT WORKERS UNION, and the Amalgamated Clothing Workers differed from the AFL in that they attempted to organize workers both along craft lines and throughout entire industries. They were progressive and even radical in their politics and more willing to confront employers with direct action to gain recognition or secure their demands. In 1902, when the UMWA encountered resistance to its attempts to organize the nation's anthracite miners, 140,000 miners walked off the job in one of the nation's largest strikes. Led by WILLIAM "Big Bill" HAYWOOD and others, the IWW pursued its goals through work stoppages, general strikes, boycotts, strikes, and other forms of direct action.

One result of the rise of new unionism was that the labor movement grew in size and strength between 1900 and 1920. Union membership increased from 2 million in 1904 to 5 million in 1920. Throughout the country, workers were organizing unions and demanding pay increases, shorter workdays, and improved working conditions. The growth in union membership was sharpest among skilled white male workers, but it also included a rise in the number of women, immigrants, and workers of color who belonged to unions.

The burgeoning labor movement began flexing its political muscle at both the state and federal level. In several states, labor-friendly Democratic or Socialist candidates were able to gain control of important political offices and helped secure the passage of pro-labor legislation, including child labor laws, workmen's compensation legislation, and maximum hour laws. At the national level, the labor movement was able to secure the passage of the CLAYTON ANTITRUST ACT (1914). Through the INDUSTRIAL RELATIONS COMMISSION, it played an active role in shaping federal policy on labor relations. The AFL was the chief beneficiary of the increased power of the labor movement. It supported with some success Democratic Party candidates in 1906, 1908, and 1912; and Gompers and other AFL leaders worked closely with the administration of Woodrow Wilson and supported the war effort.

Cooperation between the AFL and the Democratic Party reached its zenith in 1918 with the formation of the NATIONAL WAR LABOR BOARD. The AFL agreed to a no-strike pledge and the maintenance of open shop work-

places (see OPEN SHOP MOVEMENT), where employers had the ability to pressure employees not to join the union. In exchange, business leaders agreed to pay union wages and refrain from the most egregious forms of anti-labor behavior that had been typical in the years before WORLD WAR I.

The end of the war, however, brought an end to the National War Labor Board and cooperation between the labor movement, employers, and the federal government. Across the country, workers frustrated by no-strike pledges, low wage increases during the war, and rampant postwar inflation, walked off the job in one of the largest waves of strikes in the country's history. The STEEL STRIKE OF 1919, which began on September 22, 1919, and lasted until January 8, 1920, involved 365,000 steelworkers and marked the end of the uneasy labor accord reached during the war. The backlash against the labor movement was swift and widespread. Many employers had only reluctantly tolerated the AFL's presence on the National War Labor Board. With the war's end, conservative employers and antiunion business organizations launched a movement for the Open Shop.

U.S. Attorney General A. MITCHELL PALMER was convinced that many of the new unionists were supporters of the Bolshevik Revolution in Russia and were plotting to overthrow their own federal government. With the backing of the AFL and many employers, Palmer launched a series of raids against suspected radicals, the chief target of which was the IWW. During the war, many IWW leaders were arrested and convicted under the ESPIONAGE ACT (1917) for opposing the war. Now, widespread repression took place throughout the Northwest where the IWW had been strongest. In states where the IWW and socialists had become influential, local laws were passed making socialism and syndicalism illegal. By the end of 1920, the organization was in total disarray and ceased to be an effective force in the American labor movement. The RAILROAD SHOPMEN'S STRIKE of 1922 further confirmed that even well-organized and supported union workers had little traction in an antilabor environment. President WARREN G. HARDING enforced a broad national injunction against workers picketing or even assembling near rail lines. The effect was immediate and chilling for labor nationally.

Young women protesting unfair labor conditions (Library of Congress)

The demise of new unionism undermined the strength of the labor movement and ensured that it remained in a weakened state throughout the 1920s. The new unions had brought thousands of previously unorganized workers into the labor movement, and challenged the supremacy of employers and conservative state and federal policies toward organized labor. The massive post-World War I strike wave indicated the extent to which new ideas and a willingness to take direct action had taken root among American workers, but the divisions between the new and more radical unions, such as the IWW and the older, more conservative AFL, undermined the effect of the strike wave and helped ensure the demise of the new unionism. Additional setbacks occurred in 1921 when the Supreme Court, led by Chief Justice WILLIAM HOWARD TAFT, undermined the effectiveness of the Clayton Antitrust Act, and in 1922, when national coal and railway strikes were defeated.

Despite the gains made between 1900 and 1920, the labor movement proved unable to resist the postwar reaction. The gains made under the Wilson administration and during the war were the product of an administration that needed the support of the labor movement to pass legislation and ensure reelection. Employers tolerated the formation of the Industrial Relations Commission and the National War Labor Board to ensure labor peace during the war, but only after the AFL and other unions agreed not to strike during the war.

When the war came to an end, Gompers and the AFL mistakenly hoped that cooperative relations would continue. Most employers, however, were determined to preserve the open shop and hold the line against postwar wage increases. The strike wave of 1919 convinced them of the need to respond aggressively. The labor movement was unable to respond to this challenge effectively largely because the vast majority of workers remained unorganized. Despite attempts to organize recent immigrants, African Americans, and women into unions, most workers continued to toil in difficult, poor-paying, nonunion jobs. The nation's largest and most influential union, the AFL, did little to address the plight of these workers.

Although the 1920s has typically been characterized as a decade of economic growth, few American workers shared in this general prosperity. Part of this economic malaise can be attributed to an overall weakness in heavily unionized industries such as textiles and coal. The weakness of the labor movement and the increasing conservatism of the AFL played an important role in the inability of many working-class Americans to enjoy the prosperity of the decade. From the early 1920s to the Great Depression, wages and overall standards of living declined steadily for many workers. Unable to fend off the antiunion backlash of the postwar period, the AFL and the labor movement

in general failed to deliver on such bread-and-butter issues as wage increases, job security, and an improved standard of living.

Frustrated by stagnant real wages and by the ineffectiveness of the AFL, some workers began considering more radical alternatives. These included the Socialist Party and the small, but well-organized Communist Party with its labor organization, the Trade Union Education League. When the economy collapsed in 1929, American workers turned to more radical alternatives. Millions of workers, particularly those who found themselves unemployed or underemployed, became radicalized, pressured the AFL to become more active and progressive, and—when that failed—formed the Congress of Industrial Unions (CIO).

### **La Follette, Robert** (1855–1925) *Progressive Party leader*

Born in Primrose, Wisconsin, on June 14, 1855, Robert La Follette was one of the key figures in the formation of the Progressive Party. The son of a farmer, La Follette attended the University of Wisconsin, where he graduated in 1879. After graduation, La Follette began a successful legal practice in Madison at a time when midwestern farmers were finding it almost impossible to remain in business. Falling food prices due to mechanization and competition from large-scale farms meant that many independent farmers were caught in a vicious cycle of planting ever more crops, taking out ever larger loans, getting ever lower prices at harvest time, and falling ever deeper into debt. Resentment toward large-scale, urban food manufacturers and eastern banking elites led many small farmers to call for progressive reforms.

La Follette tapped this progressive sentiment for reform in his bid for the governorship of Wisconsin in 1900, promising to tax wealthy corporations, regulate the state's railroads, create a merit-based civil service, and increase state spending on public education. La Follette won the contest, and he was reelected in 1902 and 1904. Over the

course of his political career, he consistently supported progressive reforms in an attempt to limit or prevent corporate exploitation of the state's farmers and workers. Prior to assuming the governorship, La Follette had been a mainstream Republican who briefly held a seat in the House of Representatives. In his legal practice, he had represented the state's railroads and other wealthy clients on numerous occasions. However, in 1891, shortly after La Follette lost his House seat, Senator Philetus Sawyer (R-Wisc.) attempted to bribe him to influence a pending case. When the story became public, La Follette became an outcast among the state's Republicans and business elite, forcing him to build a popular base of support. Drawing on his base, La Follette championed the "Wisconsin Idea" and enacted many of the progressive reforms he had championed in 1900.

In 1906 La Follette was elected to the U.S. Senate, where he continued to push for progressive reforms, including legislation for greater federal oversight of the railroads and regulation of industries. He also pushed successfully for a constitutional amendment establishing the DIRECT ELECTION OF SENATORS and eventually developed presidential aspirations. In order to further his political ambitions, La Follette founded *La Follette's Weekly Magazine* in 1909 and created the National Progressive Republican League in 1911. In 1912, La Follette hoped to prevent the conservative wing of the Republican Party from nominating President WILLIAM HOWARD TAFT for a second term; but when former president THEODORE ROOSEVELT announced his candidacy, most of La Follette's progressive supporters decided to back Roosevelt in his unsuccessful bid.

La Follette was a leading isolationist and one of the few senators to vote against American entry into WORLD WAR I. His presidential aspirations surfaced again in 1924 when he received the nomination to head the Progressive Party ticket. Supported by progressives and organized labor, La Follette garnered a respectable 17 percent of the vote. The campaign, however, proved exhausting. By the summer of 1925, La Follette was dead. One of the leading progressive politicians of his day, he fought for tax reform, corporate responsibility, the rights of organized labor, farmers, civil service reform, and for a greater federal and state role in regulating the railroads and industry.

### Lawrence Strike (1912)

One of the first major, successful strikes of immigrant workers in a mass production industry, the Lawrence Strike led many labor leaders to believe that a new age of labor was on the rise. From January 11 to March 14, 1912, textile workers in Lawrence, Massachusetts, struck against the American Woolen Company and other smaller mills to protest a pay cut. The strike became national news. At the time, observers believed the strike had important implications for the future of labor in America. The strikers' use of mass picketing, their ethnic diversity and working-class unity, and the ability of workers to strike together across skill lines made the Lawrence Strike a model of the NEW UNIONISM. By March, the workers had won their demands for an increase in the piece rate they were paid, and the INDUSTRIAL WORKERS OF THE WORLD (IWW) had emerged as a new force in the American Labor movement.

The Lawrence Strike began when a Massachusetts law went into effect that lowered weekly working hours for women and children to 54. The mill owners announced that all workers would work the 54-hour week. Workers were paid according to the number of pieces they produced or finished. They knew that, if their hours were cut, their weekly pay would also decline unless they received an increase in the piece rate. The mill owners gave no indication they would increase piece rates, so as the date for the first pay day of 1912 drew near, Lawrence was filled with tension.

After receiving their first paychecks, workers moved through the mills. Based on old piece rates, the checks reflected deep cuts in their total pay. They broke windows and equipment before moving into the streets to join workers from other mills. The city and state officials quickly reacted by calling out the town's police force to prevent further destruction of property.

The IWW sent organizers Joseph Ettor and Arturo Giovannitti to Lawrence to support the strike. By the second day of the strike, they had organized the strikers to demand a 15 percent wage increase and double pay for overtime. The organizers also set up a central strike committee, which had three representatives from each ethnic group in the city, to run the strike.

Throughout the strike, unions battled over the future direction of the American labor movement. The conflict arose between the IWW, which advocated industrial unionism, and the United Textile Workers (UTW), a craft union affiliated with the AMERICAN FEDERATION OF LABOR. The UTW had earlier failed to organize the textile workers in Lawrence. Its native-born leaders did not reach out to the largely immigrant unskilled workforce. During the strike, the union set up relief stations, and its leaders spoke frequently of the dangers posed by the IWW. They tried to convince workers that their interests would best be served

The children of Lawrence strikers in New York City, 1912 (*Library of Congress*)

through craft unionism. Despite these efforts, the UTW failed to attract Lawrence textile workers.

The strike became a national cause among unions and attracted the attention of the major newspaper, media, and senators and representatives. Two specific events gained public support. First, the local police arrested the IWW organizers, Ettor and Giovannitti, on false murder charges. In response to the arrests, the IWW sent its best-known leaders, WILLIAM ("Big Bill") HAYWOOD and ELIZABETH GURLEY FLYNN, to take the place of the arrested organizers. Second, the police arrested a group of women and children, the wives and children of strikers, who were boarding a train in the organized effort to escape the deprivation they faced as a result of the strike. The IWW hoped to use the evacuation to evoke sympathy for their cause.

The arrest of the women and children led to a nationwide outcry over police brutality and to government investigations. The threat that bad strike publicity might threaten the wool tariff pushed the American Woolen Company to settle with the strikers. The company granted a 5 percent increase in the piece rate, an increase in the wage scale that raised the wages of the lowest paid workers 20 percent, and overtime pay. It further promised that the company would not retaliate against strike leaders.

The strike thrust the IWW onto the national scene and appeared to vindicate its strategy of organizing American labor on an industrial basis. The IWW's National Industrial Union of Textile Workers membership increased to 18,000 in the aftermath of the strike, leading people to talk of the New Unionism as a force for social change.

## League of Nations

Envisioned as an assembly with seats for all nations and a council to be controlled by the “Great Powers,” the League of Nations was established in 1919 by the TREATY OF VERSAILLES. It was the brainchild of President WOODROW WILSON, who sought to safeguard the self-determination of nations with the league and use it as a means of preventing another world conflict. Presented to Congress in 1918 as one of Wilson’s Fourteen Points, the league was envisioned as a general association of nations. Wilson’s plan formed the basis of the Covenant of the League of Nations, which centered on 26 articles and served as operating rules for the organization. The covenant was then formulated as part of the Treaty of Versailles, which ended WORLD WAR I.

The League of Nations was the predecessor of the United Nations. The purpose for its establishment was to maintain peace. Members agreed not to go to war and to submit disputes to World Court arbitration. The league existed from 1920 to 1946. The first meeting was held in Geneva on November 15, 1920, with 42 nations represented. The last meeting was held April 8, 1946.

Prior to the First World War, there were movements that pointed toward the establishment of a world association for peace. From the close of the Napoleonic Wars and the Congress of Vienna in 1815, popular support for peace societies and a concern for international law enabled national leaders to solve differences through arbitration. In 1899, and again in 1907, Russia’s Czar Nicholas called a conference at The Hague to discuss the limitation of arms and peaceful settlement of international issues. A Permanent Court of Arbitration was set up to resolve issues. Three conflicts between the Great Powers of Europe were settled this way before war broke out in 1914.

In the spring of 1914, President Wilson sent his friend and adviser, Colonel Edward House, to Europe as an unofficial ambassador for peace. House met with German officials and outlined concerns of Britain that Germany’s navy was growing. Then he met with officials from France and Britain. House’s mediation did not prevent the escalation of tensions that led to war.

In England, a League of Nations Society was founded in May 1915. In the United States, several branches sprang up. Senator HENRY CABOT LODGE early emerged as a great opponent of the idea, and he warned America not to get “entangled” with Europe. Wilson answered that “the nations of the world must in some way band themselves together to see that right prevails as against selfish

aggression.” He promoted three principles to govern such a league: one, sovereignty over self; two, right to territorial integrity; and three, that the world and its people should be protected against aggression. Wilson proposed that the United States start a movement for a universal association of nations. While speaking at West Point, he contrasted the “spirit of militarism” to the “citizen spirit.” He contended that the civilian spirit was meant to dominate the military, which was why he was commander in chief of the armed forces.

The United States entered World War I in April 1917, but it was a year before many soldiers were fighting in France. That summer Wilson appointed a committee to study Europe and its laws, peoples, and economies. Utilizing this research, Wilson formulated a list of war aims and peace suggestions, and he presented them to Congress as the “Fourteen Points.” The Fourteen Points argued specifically for a safer world run by self-governing nations. Wilson declared that the United States would be willing to fight for principles of international justice, which it adopted as the basis for peace. On October 6, 1918, the German government requested peace negotiations. The Germans agreed to disarm and relinquish their monarchical military leadership. They wanted a peace according to the points made in President Wilson’s speeches. After the Armistice, the Paris Peace Conference was held, out of which came the Treaty of Versailles.

The idealist Wilson faced a serious challenge from European diplomats, who were determined to gain all they could for their national interests. Lloyd George of England had just been reelected with the slogan, “be tough on Germany.” Clemenceau of France also wanted a weak Germany. The Italians and Japanese wanted specific territories. President Wilson introduced the League of Nations draft to the Peace Conference with an address on February 14, 1919. The day after the draft was accepted by the plenary session, the president departed for the United States, where he set to work on gaining public support for the league treaty and the League of Nations.

Political conflict kept the United States out of the league. The United States, Germany, and, initially, the new Soviet Union did not join the League of Nations. United States isolationists were against involvement. The United States, consequently, never ratified the Treaty of Versailles. As a consequence of the war, supervision of territories that had been colonies and possessions of Germany and Turkey before the war was awarded to league members in the form of mandates. These territories were issued varying degrees of independence depending on their stage of development. The Soviet Union and Germany both joined the league years after its inception.

As established, the league gave each nation one vote. Either party to a dispute could submit an issue to the

league's executive committee. The debate could then be drawn out of the executive committee to the larger body of delegates, which ensured the moral force of international public opinion. If moral force failed, physical force remained in reserve. The helpless people of the world, it was thought, could expect a new light and a new hope.

The League of Nations achieved some of its goals in stemming the tide of international traffic in narcotics and prostitution, aiding war refugees, and surveying and improving on health and labor conditions in the world. During the 1920s, the league assisted in settling some minor disputes, but it was hampered by the nonmembership of the United States. Ultimately, the failure of the league to prevent Japanese military ambitions in Manchuria and China, Italy's takeover of Ethiopia, and, finally, Hitler's renunciation of the Treaty of Versailles, discredited it as an international authority. Although it was not effective as a peacekeeping body, the League of Nations did lay the groundwork for international cooperation in its successor, the United Nations, which was founded in 1946.

### Leo Frank case

The case of Leo Frank involved a 1913 murder and trial in Atlanta, Georgia, that became a national affair. On April 27, 1913, 14-year-old Mary Phagan was found murdered in the basement of a pencil factory in Atlanta, Georgia. The grisly murder shocked the community. Public dismay was heightened by the fact that the scene of the crime had been a factory, a symbol of the encroachments of capitalist industrial economy in the South. Outrage over Phagan's death quickly turned to a public demand that her killer be caught. Suspicions first settled on the factory's night watchman, an African American named Newt Lee. The evidence initially implicating Lee, however, turned out to be weak. Prosecutors' suspicions then turned to the superintendent of the factory, Leo Frank.

The prosecutors built a case against Frank based on circumstantial evidence and rumor. Many of the rumors were later proven false. The evidence against Frank centered on his being one of the few people in the factory on the day of the murder and his inability to provide a persuasive account of where he was when the murder occurred. Other accusations focused on Frank's alleged sexual perversity. Some women factory workers claimed that Frank had

made sexual advances to them. A madam of a local bordello charged that he frequented her establishment. Despite the lack of evidence, the Atlanta newspapers seized every new development as proof that Frank was the killer. His trial thus took place amid the public perception that he was guilty.

The Frank case also took on other implications because of what Frank represented in the South. To many, Mary Phagan's death was proof of the dangers that industrial capitalism would bring to the South. The small family farm was in decline while industry was spreading. Many southern farmers were forced to send their wives and daughters to work in the new factories. Southerners thus saw factories not only as a symbol of the power of industrial capitalism, but also as a threat to their wives and daughters. To add to public fears, Leo Frank was Jewish, which made him suspect in the eyes of many. Anti-Semitism was prevalent in American culture. Racial prejudice characterized Jewish American men as sexual predators who preyed on innocent women. Leo Frank thus became to many a symbol of market power and a danger to the southern way of life. Combined with the predatory character of capitalism in the eyes of southerners, anti-Semitic feelings created an explosive situation that ended in a lynching.

Frank was found guilty. After the trial, many people started to question the verdict. Some of the evidence against Frank was revealed as false. When it appeared that Frank might be granted a lenient sentence, or even worse a new trial, many southerners denounced the possibility as due to his position and wealth. Frank did not, however, live long enough to see another trial. First, another inmate assaulted Frank and slit his throat, a wound from which he was recovering when a lynch mob broke into the jail, removed Frank, and lynched him. The Leo Frank case was one of the last and most visible public lynchings of the Progressive Era. For some traditionalists in the South, his death at the hands of a lynch mob was seen as a kind of urban frontier justice. For advocates of a New South, however, the Frank lynching was a painful reminder of how far southern justice had to travel to become modern.

### Leopold and Loeb (1924)

In a 1924 murder trial that captured the nation's attention, Nathan Leopold and Richard Loeb were convicted and sentenced to life in prison for the murder of 14-year-old Bobby Franks. The trial of Leopold and Loeb captured the

nation's attention for a number of reasons. First, they were both teenagers. To many observers, the fact that two teenagers would plan and carry out a murder as cold-blooded as the murder of Bobby Franks served as an indictment of modern youth. At a time when many Americans were seeking advice on rearing children in the new corporate-industrial age, the fact that Leopold and Loeb came from wealthy families demonstrated to many that overindulged youth posed a threat to society. The trial captured the nation's attention because CLARENCE DARROW, the country's best-known trial attorney, represented the defendants. The trial was also significant because Darrow used the testimony of psychologists in arguing that the two had lived abnormal upbringings that shaped them into murderers. By doing so he successfully avoided the death penalty.

Leopold and Loeb were highly intelligent teenagers who graduated from college before they were 18 years old. Together they committed a series of crimes ranging from petty thefts to auto thefts. They apparently planned to murder someone for the intellectual challenge of literally getting away with murder. Planning the killing without a specific victim in mind, they developed a plan and waited for a victim to show up on the scheduled day. On May 21, 1924, Bobby Franks simply ended up in the wrong place at the wrong time. He was a neighbor of both Leopold and Loeb. On his way home from a football game at school, Franks accepted a ride from them. Although it was never determined for certain which of the two killed Franks, one of them knocked him unconscious with ether and beat him to death with the handle of a chisel. The two killers then left his body in a drainpipe in a wilderness area south of Chicago.

Leopold and Loeb then attempted to make the killing look like a kidnapping by contacting Franks' family to demand a ransom. Before they could follow through on the kidnapping plot, however, Franks's body was discovered. During the manhunt for the killers, Leopold and Loeb even went so far as to help two friends who were journalists try to track down the killers. The case broke when a pair of eyeglasses was found at the scene that turned out to belong to Leopold. Faced with the overwhelming evidence against them, the pair pleaded guilty.

Clarence Darrow took the case partly because he opposed the death penalty and saw it as an opportunity for a public forum to argue against it. The defendants pleaded guilty in order to avoid a trial by jury, which Darrow believed would end in the death sentence. Before a judge in the sentencing hearing, he introduced lengthy testimony by psychologists. Their testimonies were the first time that many of the emerging psychological theories were introduced into a court of law. They testified that Leopold and Loeb suffered through abnormal childhoods that included excessive fantasizing, excessive reading of detective fiction,

drinking alcohol at an early age, associating with people much older than themselves, and, in the case of Leopold, sexual abuse by a governess and the death of his mother when he was 14. Darrow did not argue that Leopold and Loeb were insane due to their upbringing. He argued that, due to their childhoods, they developed abnormally and therefore should not be sentenced to death for their crime. The judge agreed that their upbringing mitigated the circumstances of their crime and sentenced them to life in prison. Richard Loeb was killed in prison in 1936. Nathan Leopold was paroled in 1957 and died of natural causes in 1971.

### **Lindbergh, Charles Augustus** (1902–1974) *aviator*

As the pilot who flew the first solo nonstop flight across the Atlantic Ocean on May 20–21, 1927, in his airplane *The Spirit of St. Louis*, Charles Lindbergh was heralded as the "Lone Eagle" and "Lucky Lindy." He gained international renown for his solo flight. Lindbergh was born February 4, 1902, in Detroit, Michigan, and grew up in Little Falls, Minnesota. His father was Charles Augustus Lindbergh, Sr., a lawyer and U.S. congressman from Minnesota from 1907 to 1917. His mother was Evangeline Land Lodge.

Interested in mechanics as a boy, Lindbergh attended the University of Wisconsin's engineering program for two years but left it to enroll in a flying school in Lincoln, Nebraska. He then became a barnstormer pilot, performing stunts for audiences at fairs, before he joined the U.S. Army as a pilot in the Army Air Service Reserve. After additional training, he graduated from flight school and transported mail between St. Louis and Chicago for the Robertson Aircraft Corporation.

Lindbergh's ambition was to make the solo transatlantic flight. Nine St. Louis businessmen whom he persuaded to support the effort financed his plane, the *Spirit of St. Louis*. He sought to win a prize of \$25,000 for one flight offered by New York City hotel owner, Raymond Orteig. The winner would be the first aviator to fly nonstop from New York to Paris. Lindbergh helped design the plane, which successfully made the record-setting trip in 20 hours and 21 minutes. "Lucky Lindbergh" landed at Le Bourget Field near Paris to be greeted by thousands of cheering fans. He became an instant hero. When he came home to America, he was aboard the USS *Memphis*, and President CALVIN COOLIDGE welcomed him home personally. Four

Charles Augustus Lindbergh standing beside the *Spirit of St. Louis* (Library of Congress)

million other people greeted him for a New York parade before his return to St. Louis for a rest. Lindbergh was awarded the Congressional Medal of Honor and the Distinguished Flying Cross.

Lindbergh's fame allowed him to promote both aeronautics and international goodwill. He wrote a book about his flight entitled *We*, referring to the author, his plane, and their experiences on the transatlantic flight. Lindbergh then traveled throughout the United States promoting aeronautics for the Guggenheim Fund. In a three-month nationwide tour, he flew the *Spirit of St. Louis*. He visited 49 states and 92 cities and gave 147 speeches.

Lindbergh became interested in the research of the scientist Robert Goddard, who was conducting experimental research on missiles, satellites, and rockets. He drew the attention of the Guggenheims to Goddard's research efforts in order to help him in funding further projects. Lindbergh also flew to various Latin American countries in 1927 fostering goodwill between America and Latin Amer-

ica. It was on the Latin America tour that he met Anne Morrow, daughter of the American ambassador to Mexico. He married Morrow in 1929. After teaching her to fly, the couple undertook flying expeditions throughout the world.

After the kidnapping and death of their son, Charles, Jr., the Lindberghs fled to Europe to seek privacy and safety. While in Europe, Lindbergh was invited to tour various aircraft industries. He was particularly impressed with the advanced aircraft industry of Nazi Germany. After returning to the United States, Lindbergh spoke out against American intervention in any European war, supported pro-Hitler German-American groups, and criticized the policies of Franklin Delano Roosevelt. After Roosevelt denounced him, Lindbergh resigned his commission in the Army Air Corps. Refraining from his non-interventionist activity after Pearl Harbor, Lindbergh once again undertook military duties. In 1944, he flew about 50 combat missions in the Pacific despite his status as a civilian.

Lindbergh spent the rest of his life as a consultant, writer, and traveler. In 1954, President Eisenhower restored his commission and appointed him brigadier general in the U.S. Air Force. Lindbergh worked for Pan American World Airways advising on jet purchases, and eventually helped design the Boeing 747. Before dying of cancer in 1974, he spoke out for the conservation movement. He was particularly interested in campaigning for the protection of humpback and blue whales. He lived at this time of his life in Maui, Hawaii, where he published his collection of writings entitled *The Autobiography of Values*.

## literature

The literary culture of the United States, much as its religious culture, experienced a tremendous shift in the years between 1900 and 1930. The genteel tradition of American letters that had been carefully cultivated over the course of the 19th century was in the midst of a commercial revolution. While Henry James, one of the major figures of the nation's literary renaissance, continued to publish in works such as *Wings of the Dove* (1902), *The Ambassadors* (1903), and *The Golden Bowl* (1903), he was supplanted by other voices. The elite world of letters in which he had made his mark gave way to the influence of commercial media in new literary journals like *Collier's* and *McClure's*, and in alternative journals like Harriet Monroe's *Poetry*, Margaret Anderson's *The Little Review*, and H. L. Mencken's *American Mercury*. A new generation of small publishers like Modern Library, Horace Liveright, and Alfred Knopf proved more willing to publish new authors and risk violating the censorship laws. The flourishing of a RADICAL AND LABOR PRESS that gave space to new cultural trends, as well as alternate politics, opened the doors for diversity in literary voice, range, and genre.

The literary world imagined itself immune to commercial pressures, but neither academic literary criticism nor high art engaged new consumers of fiction. Innovative writers in the early 20th century did respond to increased demand fueled by new marketing techniques and lower subscription prices. With ties to mass journalism and experience in magazine publishing, authors such as Theodore Dreiser, UPTON SINCLAIR, and Frank Norris brought vivid naturalist prose and social criticism to the educated middle-class public. Rebellious against the politeness of older literature, they introduced language, imagery, and narratives that bore little resemblance to the genteel tradition or the literary realism of James and William Dean Howells.

Literary naturalism assumed that characters were the product of a dehumanizing environment. Individual trajectories of success or failure had little to do with individual qualities. Dreiser's *Sister Carrie* (1900) shocked readers with its story of a young woman who, after she is sexually betrayed, sets out to make her own conquest. His novels *Financier* (1912), *Titan* (1914), and *An American Tragedy* (1925) similarly exposed the social forces that led to success or failure. Frank Norris's brutal portrayals of corporate and political bosses in *McTeague* (1899) and *The Octopus* (1901) and Jack London's social novels *The Iron Heel* (1907) and *Martin Eden* (1909) resonated with the same naturalistic sensibility. With such books as *The House of Mirth* (1906) and *Ethan Frome* (1911), Edith Wharton brought naturalism to the study of the upper classes. Willa Cather similarly brought serious themes of immigration, community, and the impact of environment on character to her readers in *O Pioneers!* (1913), *My Ántonia* (1918), and *Death Comes for the Archbishop* (1927).

Coined as a term in 1890s Germany, MODERNISM first emerged in the United States shortly before WORLD WAR I. Allied with literary experimentation and the cultural radicalism of artist colonies like GREENWICH VILLAGE and Provincetown, modernism in art and literature represented a break from the past. The modernist sensibility also rebelled against rigid Victorian sexual mores and the unquestioning belief in the virtues of progress. Gertrude Stein, one of the most famous American writers living abroad, argued that the United States had become the first modern, and thus the oldest, nation in the world. The rest of the world was forced to catch up. Stein was known as an unconventional writer who experimented with language, subject, and genre. She and her generation of writers were among the first to give voice to the new stresses and pleasures of the age. Honesty was their hallmark. Modernist photographer Alfred Stieglitz wrote that art must embrace "honesty of aim, honesty of self-expression, and honesty of revolt against the autocracy of convention." The primitivism that animated modern art sometimes prevailed in literature as well. Moving beyond literary naturalism, modernist writers experimented with language, abandoned metered verse, and broke conventions of plot and genre. In poetry, imagist writers such as Ezra Pound, H. D. (Hilda Doolittle), and Amy Lowell challenged the idea of poetry as a direct representation of feeling; other modernist poets such as T. S. Eliot, William Carlos Williams, and Gertrude Stein pushed free verse into new territory with experiments in form and language. Dramatists such as Eugene O'Neill told similarly experimental tales of sexuality and race in his plays *Emperor Jones* (1921), *The Hairy Ape* (1922), and *Desire under the Elms* (1924). Modernist writers such as John Dos Passos in *Three Soldiers* (1920) and E. E. Cummings in *The Enormous Room* (1920) worked against the

conventions of unitary narrative to create collages within the structure of their novels.

In historical writing, similar commitments surfaced to a modernism that challenged older ideals of objectivity and the legitimate subject of historical study. Led by progressive writers such as Charles and Mary Beard and Vernon Parrington, historians read and critically challenged the basis of positivist historical science. Historian and sociologist Lucy Maynard Salmon in many respects led the way with her unconventional history of the backyard and her study of domestic service. Not only historians but also sociologists such as William Graham Sumner, Lester Ward, Thorsten Veblen, and George Herbert Mead attacked the ideal of objectivity in the human sciences to address directly the social construction of reality. This modernist social science was far from an academic pursuit. The Beards' history of the United States was, by illustration, an important and widely popular book in its day; so too were the writings of Sumner and Ward, among others. By 1909, the writings of SIGMUND FREUD also made their appearance in American bookstores.

The destruction of World War I intensified the trend toward modernism in literature and social science. The war

Sinclair Lewis (Library of Congress)

had distorted the perception of time, altered the nature of personal identity, and warned of the dangers of technology and the price of nationalism. In its aftermath, American writers confronted their national culture and discovered new influences and legacies. As literary historian Ann Douglas characterized it, the LOST GENERATION of 1920s intellectuals adopted new values of blunt honesty and pluralism in their art. Having cast aside the genteel culture of the Victorian age, they sought to cast off conservative ideas and racial prejudices as well. The writers of the 1920s embraced instead the influence of African-American culture and the cynicism of postwar society. They emphasized the discovery of "truth" in art.

The postwar generation of writers provided a running critique of the weaknesses and strengths of American culture. In such publications as the *New Yorker*, writers Dorothy Parker and Robert Benchley and theater critic Alexander Woolcott ridiculed elite culture, old-fashioned social norms, and the provincialism of American life, as did H. L. MENCKEN in *The Smart Set* and *American Mercury*. Novelist Sinclair Lewis brought his critical skills to portraying small-town residents in *Main Street* (1920), businessmen in *Babbitt* (1922), doctors in *Arrowsmith* (1924), and evangelists in *Elmer Gantry* (1927). Despite their occasionally biting tone, Lewis's books sold millions of copies. His talent for creating characters and writing dialogue, and his ability to capture the contradictions of middle-class and rural lives, earned him international attention and made him the first American to win the Nobel Prize in literature in 1930. Urbane humor competed for center stage with serious political and cultural criticism. At the same time, popular novelists such as Edna Ferber reached a broad audience with stories probing the private side of the American dream and the place of women within it. Her novel, *Show Boat* (1926), offered to popular audiences some of the seamier and more subversive relations between the sexes and among races. Abroad, writers F. Scott Fitzgerald and Ernest Hemingway revealed the underside of American masculinity in such characters as Jay Gatsby and Jake Barnes. The gallant and romantic Gatsby was what every businessman was at heart—a gangster, as Fitzgerald saw it, while Jake in *The Sun Also Rises* (1926) is physically and emotionally disabled. In John Dos Passos's *Three Soldiers* (1922) and William Faulkner's *Soldier's Pay* (1926), disillusioned war veterans feel a loss of self and power in the materialistic postwar world.

The modernist turn coincided with a general American cultural revival. At the center was an emerging generation of African-American writers, artists, and performers in what has been called the HARLEM RENAISSANCE. This explosion of creativity was not so much a rebirth of African-American literary expression as its integration into mainstream modern literature and art. With the 1920s, audiences across the

racial divide were newly exposed to the mythology, language, and musical traditions of African Americans. The GREAT MIGRATION had brought with it a southern black literature, which attracted new audiences and brought increased patronage to African-American writers and artists. Among the writers associated with this cultural flowering were Langston Hughes, Jean Toomer, ALAIN LOCKE, Claude McKay, Nella Larsen, and Zora Neale Hurston. Hughes in particular would become the voice of the black community, moving from cultural modernism in the 1920s to the sharper social and political critique of his depression-era writings. All of the writers shared the concern of defining African-American identity as dualistic, a product of both African and American experience. They sought to explore the dimensions of racial life and consciousness in such books as Toomer's *Cane* (1923), Locke's *The New Negro* (1925), Larsen's *Passing* (1929), and Hughes's *Not Without Laughter* (1930).

The intellectual community was similarly open to broadening cultural perspectives. In *Culture and Democracy in the United States* (1924), Horace Kallen first launched the idea of an American democracy dependent not on the suppression, but on the celebration, of ethnic diversity. During this decade, his work was echoed by a school of anthropologists working with FRANZ BOAS. Boas and his students—MARGARET MEAD, Ruth Benedict, Edward Sapir, Zora Neale Hurston, and Melville Herskovits—helped to undermine belief in Anglo-American superiority and to dismantle scientific racism. Their works were incredibly popular treatments of life in different cultures and further called into question American culture. In *Coming of Age in Samoa* (1928), Margaret Mead showed that child-rearing practices of another culture were not only different but also led to healthy attitudes toward self, community, and sexuality. *Growing Up in New Guinea* (1930) revealed how men's involvement in child care and the education of youth positively reaffirmed masculine identity in the community. Other studies of northern migrants, southern folklore, and Native American culture suggested that there was no one right culture nor any scientific basis for a belief in racial differences in intelligence and ability. The modernist sensibility, first expressed in literature and art, began to infiltrate the social sciences and the politics they inspired.

### lobbying and interest groups

In the first three decades of the 20th century, the rise of interest group POLITICS brought new lobbies and organizations into the political arena. These groups included avowedly nonpartisan organizations such as the League of Women Voters and the Good Government League, as well as professional organizations like the American Medical Association and the American Farm Bureau, and such partisan groups as the Anti-Saloon League, the National Mothers' Congress, the AMERICAN LEGION, and the KU KLUX KLAN, which ran its own candidates for political office.

Businesses also were committed to using public interest groups such as chambers of commerce and trade associations. Interest groups lobbied for legislation, raised funds, mobilized voters and letter writers, and created political conditions favorable to their own—and, they argued, the public's—interests. Their emphasis on marshaling the resources of government to stimulate business growth, as well as to restrict government intervention in taxes and regulation, paid off in the business prosperity of the era. It had a negative impact, however, in the overall economic picture. While federal debt declined due to economy in spending, state and municipal debt mounted. Unequal distribution of income and wealth led to a weakening of consumer demand and personal indebtedness.

Although labor unions were weak throughout the period, the AMERICAN FEDERATION OF LABOR worked for significant federal legislation and, under the presidency of WOODROW WILSON, succeeded to a certain extent. The creation of a Department of Labor, and the passage of the CLAYTON ANTITRUST ACT and the ADAMSON ACT, gave witness to the power of organized labor. The AFL lobbied for immigration restriction, special laws for seamen and sailors (as well as government workers), and relief from antitrust laws and labor injunctions.

More powerful than organized labor were political organizations that represented American farmers. Developing out of 19th-century organizations such as the Grange, new groups like the American Farm Bureau became effective political agents for the mass of farmers. Unlike labor, which represented at the time about 6 percent of all wage workers, the Farm Bureau could claim to represent all farmers, who constituted about 25 percent of voters in the United States. Begun in 1919, the Farm Bureau had more than a million members by 1921. With claims such as that, it was able to have a substantial impact on legislation, particularly as it organized the Farm Bloc in Congress. The Farm Bureau helped secure the passage of legislation favorable to farmers, including the CAPPER-VOLSTEAD ACT (1922),

which protected farm cooperatives from antitrust suits and other laws that increased tariffs and extended farm credits. The McNary-Haugen Farm Bill, a failed attempt to raise the prices of agricultural commodities, was a favorite item on the Farm Bloc's agenda. In addition, the Farm Bureau and other farm advocates sought relief from state and local property taxes, which laid an unfair tax burden on farmers and cut into declining farm income.

Among interest groups, African Americans represented themselves in a range of organizations, but racial hostility and discrimination weakened their power. The NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP) had small influence in governmental matters, despite the active participation of African Americans as members of the REPUBLICAN PARTY and as soldiers in WORLD WAR I. Its efforts to pass an antilynching bill were stymied in 1922.

Despite the claim that public interest groups supplanted the power of political parties, it was party politics that benefited from their growth. Older party structures lacked both the constituency and the resources to manage the country's politics and government on their own. New forms of direct democracy such as initiative, referendum, and recall required parties to have a dependable way of mobilizing voters. Interest groups thus provided the services and resources that kept alive the party system in a time of declining party loyalty.

### ***Lochner v. New York*** (1905)

The decision of the United States Supreme Court in *Lochner v. New York* is considered one of the most controversial in its history. Critics of the judgment view it as an example of blatant judicial activism, in which the Court used its power of judicial review to protect conservative economic policies against an era of regulatory reform. Labor reformers had concentrated their attention on legislative solutions to industrial ills. Long hours, low wages, and corrosive working conditions led to child labor laws, maximum hours and minimum wage legislation, and new safety standards. By 1905 many states had enacted statutes to protect workers. Despite the reputation for being conservative, most courts upheld the reform legislation. In

*Lochner v. New York*, however, the Supreme Court struck down a maximum hours law. At the very least, the ruling in *Lochner* showed a lack of consistency in the court's decisions.

In 1893, New York passed the statute that became the point of contention in Joseph Lochner's litigation. The Bakeshop Act limited the number of hours bakers could labor to 10 a day and 60 a week and included provisions setting minimum standards for sanitation in all bakeries. Earlier, journeymen bakers in the state had organized the Baker's Progressive Union. It had been active in securing the Bakeshop Act, but the baker's union was not powerful throughout the state. Only in areas where the union was strong could the 1893 act be enforced. Lochner owned a small nonunion bakery in Utica, New York. He ignored the Bakeshop Act by requiring his workers to labor more than 60 hours a week. The town's journeymen bakers lodged a complaint against Lochner. He was found guilty of violations and fined. He appealed his conviction, and his case eventually reached the U.S. Supreme Court.

The Supreme Court decision in *Lochner* has been characterized as a conflict of competing ideals. At odds were conceptions of laissez-faire economic theory and the nation's reform agenda. Reform advocates based regulatory statutes like the Bakeshop Act on the state's police powers. By this authority, a state can act in ways necessary to protect the health, safety, and welfare of its citizens. What exactly constituted a valid use of the state's police powers was vague. In general, a law based on the state's police powers had to regulate specifically to clearly recognized health or safety objectives, which reformers believed that industrial conditions threatened the state's welfare and warranted using these powers.

On the other side, proponents of laissez-faire economic theory believed that maximum hours legislation was an unwarranted intervention into an individual's right to contract. The Supreme Court had previously ruled that the liberty of contract was protected by the Fourteenth Amendment to the Constitution, which guaranteed that no "State [shall] deprive any person of life, liberty or property, without due process of law." Adherents held that a worker had a right to property in his labor. State regulation would limit a laborer's ability to make contracts and therefore limit his ability to utilize his property. But liberty of contract assumed an equal playing field between employer and employee, which simply didn't exist.

Based on precedent, the Supreme Court should have ruled against Lochner. In *Holden v. Hardy*, the Supreme Court upheld legislation that limited mine work to eight hours a day as a reasonable use of the state's police powers. Furthermore, it dismissed the liberty of contract argument, stating that the employer and employee were

not bargaining from equal positions. But in *Lochner v. New York*, the Supreme Court held that the New York Bakeshop Act was unconstitutional. Justice Rufus Peckham wrote for a bare 5-4 majority. It held that the law was not a valid exercise of the state's police power, because the number of hours of a baker's labor did not affect the public health. He declared that such acts are, "mere meddlesome interferences with the rights of the individual." Interestingly, Justice OLIVER WENDELL HOLMES disagreed with the Court's decision and wrote a brief but powerful dissent. Pointing to the underlying issues, Holmes wrote, "This case is decided upon an economic theory which a large part of the country does not entertain . . . The Fourteenth Amendment does not enact Mr. Herbert Spencer's *Social Statics*."

Both the *Lochner* decision and its legacy reveal a lack of consistency in the Supreme Court's decisions in this era. Historians point out that the various courts tended to uphold reform legislation, but they were consistently hostile to laws that supported unions. Justice Peckham did not broach the issue of unions, but he was fearful of increasing government intervention in labor regulation. This decision might explain why the Court moved away from the precedent. In the end, many state courts disregarded the *Lochner* decision, and its effects at the federal level were uneven. Still, it remained prevailing law for almost 30 years.

**Locke, Alain LeRoy** (1886-1954) *philosopher, editor*  
An author, intellectual, and educator, Alain Locke was best known as the intellectual voice of the HARLEM RENAISSANCE. Born in Philadelphia, Locke entered Harvard University in 1904 and became the first African-American Rhodes Scholar in 1907. After attending Oxford University in England, he went to the University of Berlin. In 1911 he returned to the United States and began his career as an African-American spokesman and educator at Howard University in Washington, D.C.

Heavily influenced by the work of anthropologist FRANZ BOAS, Locke argued that race was not biological but historical. He went further than Boas by removing any hereditary factors from his view of race in favor of a pure environmentalism. Race and racial relations were deter-

mined by the historical circumstances of a time. Instead of races creating cultures, Locke argued that cultures created races. In support of his position, he pointed to ethnic relations and conflict in eastern Europe. He argued that the conflict between ethnic groups in Europe was not different from the conflict between whites and blacks in the United States, but was determined by a different set of historical circumstances. Locke's most important insight was that race relations pass through definitive stages in relation to political, economic, and demographic change. Thus, there was nothing static about race and relations between races. These views influenced historians of African-American history for years. Locke also recognized that race was an ideology that masked other interests. He was particularly interested in how class interests were covered by racism. Locke did not, however, accept the beliefs of those intellectuals who equated race prejudice with class conflict. He argued that racism had begun as a class construct but had taken on a cultural meaning separate from any class meaning.

His embrace of the importance of culture in race relations and formation led Locke to champion the development of an African-American culture. He argued that one could recognize that cultural differences existed without accepting racist beliefs. In fact, African Americans should use race, Locke argued, as a means to empowerment. They could build self-esteem and solidarity that would help them in the competitive society in which they lived. Locke pointed to literature and the arts as a way to build race consciousness without threatening white America. By doing this, African Americans also would disprove racist myths that held that African Americans did not possess any real culture of their own. This belief that African Americans could use art and literature became the basis for his advocacy of the Harlem Renaissance.

His 1925 book, *The New Negro: An Interpretation*, solidified his identity as a spokesman for the Negro Renaissance. In this work, Locke argued that the artistic and literary innovations occurring in Harlem offered a basis for the cultural development of the New Negro. This was all made possible by the migration of African Americans from the South to the urban areas of the North. These urban concentrations of African Americans were giving rise to a new culture based on a common racial past both as Africans and as African Americans.

**Lodge, Henry Cabot** (1850–1924) *politician*

Tenacious opponent of President WOODROW WILSON, Henry Cabot Lodge opposed the social reform movement of Wilson's era and the nation's lack of military preparedness after 1914. Lodge criticized the government for its slow mobilization, shortages of equipment, failure to prevent strikes, and delays in production during WORLD WAR I. He and the former president, THEODORE ROOSEVELT, led the PREPAREDNESS movement that sought to persuade the Wilson administration and the population of the United States that the nation must prepare itself for war. Later, as chairman of the Senate Committee on Foreign Relations, Lodge led the campaign against the ratification of the TREATY OF VERSAILLES and U.S. participation in the LEAGUE OF NATIONS.

Lodge was born in Boston, Massachusetts, on May 12, 1850. Graduating from Harvard in 1871 and from its law school in 1874, he was awarded a Ph.D. in 1876. Lodge taught American history at Harvard and edited *The North*

Henry Cabot Lodge (*Library of Congress*)

*American Review* and *The International Review* until entering politics in 1879. He served two years in the Massachusetts House of Representatives and six years in the U.S. House of Representatives. He was elected to the U.S. Senate in 1893, where he remained for the rest of his life.

Lodge's influence was exerted through chairmanship of the powerful Senate Foreign Relations Committee from 1896 on. In international affairs, Lodge believed that a large modern navy and a dominant influence in the Caribbean and the Pacific were vital to the country's security. His beliefs were based on the theories of Admiral Alfred Thayer Mahan, who had advanced the idea that sea power was the determining factor in international affairs. As a result of Mahan's influence, Lodge favored U.S. entry into the Spanish-American War and favored the acquisition of the Philippines. Being a conservative, he supported the gold standard and high protective TARIFFS.

Immediately after Europe became embroiled in hostilities leading to World War I, Lodge became a proponent of military preparedness. He pointed out that the United States could no longer depend on its geographic advantages and distance from the European continent as a safeguard from invasion. Like others in the preparedness movement, Lodge advocated a buildup of the army and navy and additional funding for training and equipment. Eventually, President Wilson would be drawn into the effort to mobilize the military resources of the nation, despite his promise to keep the country out of the war.

When Germany sued for peace in 1918 and world leaders attended the peace conference in France, Wilson joined the conference with a select group of experts but failed to invite anyone from the Senate, including Lodge. His failure to indulge Senator Lodge caused irreconcilable differences between them, which resulted in the Senate refusing to ratify the Treaty of Versailles. Specifically, Lodge opposed Wilson on American participation in the League of Nations; he felt that the league clauses would involve the United States too deeply in European affairs. Wilson tried to take his case to the people, but he was overcome with sickness. Lodge later also opposed U.S. participation in the World Court. In 1921, Lodge was the U.S. delegate to the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT in 1921. He died on November 9, 1924.

**Lone Wolf v. Hitchcock** (1903)

In the late 19th century, U.S. policy toward NATIVE AMERICANS focused on dismantling tribal authority and

assimilating Native Americans into mainstream society. The program hinged on the allotment of tribal lands from reservations to individual members and families and selling off “surplus” land to white settlers. The process of allotment began with the Dawes Severalty Act of 1887, but it was carried on through the Bureau of Indian Affairs, federal and state courts, and a series of laws that continued to loosen the restrictions on the lease and sale of Native American land. Few tribes escaped the impact of allotment, but the worst abuses of the land policy occurred in the Indian Territory of what is now Oklahoma, where reservations were forcibly dismantled and the land leased or sold, much of it under the guise of white guardianship of Native Americans and their land.

Kiowa chief Lone Wolf, and other Kiowa, Comanche, and Apache, sought to stop the forcible allotment and alienation of tribal land in the case of *Lone Wolf v. Hitchcock*. Basing their suit on the Treaty of Medicine Lodge signed in 1867, the Kiowa argued that the treaty required that all land transfers have the consent of the majority of adults on the reservation. The Medicine Lodge Treaty had already drastically reduced tribal holdings from 90 million acres to the 2.7 million acres of then-current reservations. The policy of allotment promised to strip all resources from the tribes and reduce their members to poverty on small plots of land. Further, the allotments given to Lone Wolf and other Kiowa had not earned the requisite support from tribal members, and the transfer of land was, therefore, invalid. Reversing its traditional stand on the importance of property rights and contract law, the Supreme Court in 1903 held against the Kiowa and accepted the sale of surplus land as valid. They accepted the argument of the defendant that the majority of Kiowa had agreed to transfer land for money in 1892. The court case also revealed the tangled alliances that made both allotment and the court case possible. On the one side, reformers seeking to assimilate Native Americans pushed for the division of land and their integration into white farming regions. On the other side were the “implacables,” who resisted white society and modernization, and their allies, the cattle ranchers who wanted to lease Native American land and resisted farm settlement. Allotment won out.

The Court’s decision, which essentially denied Native American tribal sovereignty, had ramifications beyond Oklahoma. It made legal the U.S. violation of any and all treaties with Native Americans and set the parameters of Native American land policy for the next five decades. It underlined the dependent status of Native Americans under law and allowed the policy of allotment to forge ahead unaffected by formal agreements or governmental treaties. For these reasons, *Lone Wolf* became the most frequently cited court case in Native American law. It was only in 1955 that the Indian Land Claims Commission granted the Kiowa,

Comanche, and Plains Apache \$2 million as compensation for the illegal sale of land.

## Lost Generation

No group of artists and intellectuals had a greater impact on early 20th-century American literature than the group that came to be known as the Lost Generation. Associated with the alienation over WORLD WAR I, they became disenchanted with crusades at home and abroad. They saw the failures of America’s involvement in the war and its futile PROHIBITION effort at purging alcoholic drink as symptoms of a society that was sick. The Lost Generation also embraced trends toward MODERNISM and rebelled against literary convention.

Gertrude Stein coined the term, “the Lost Generation,” in reference to the young Americans who had survived World War I. In an epigraph to Ernest Hemingway’s *The Sun Also Rises*, she noted, “you are all a lost generation.” The perceived futility of the war led a growing number of Americans to abandon WOODROW WILSON’s idealistic vision of a world that was safe for democracy. The magnitude of the war effort and its human cost undermined faith in government and society. Americans increasingly saw the war as a cruel hoax in which Americans were betrayed into suffering and death. The young Americans who went off to fight did not come back as heroes. They came back as poor duped innocents whose sacrifices were in vain. The Lost Generation symbolized and championed this growing sense of disillusionment.

These young writers were one of the first artistic cohorts to be viewed as a distinctive generation. What made them distinct was that their youth coincided with the war and the great influenza outbreak. Those living in the 1920s were divided into separate and distinct categories. There were those who came of age before, during, and after the war. Most of the men termed members of the Lost Generation came of age in the immediate post-war period. They challenged the path that the previous generation had trod.

Ernest Hemingway (1899–1961) was one of the most celebrated of the group. His 1929 novel, *A Farewell to Arms*, summed up the emerging attitude toward war. The hero of the story was not a man who won his acclaim on the battlefield. It was his disdain for the conflict that made him a hero. His defining act, which Hemingway applauded, was abandoning the war effort in search of love with a nurse that he met in a war hospital. The needs and the wants

F. Scott Fitzgerald and Zelda Fitzgerald (Hulton/Archive)

of the individual seemed to trump that of an undefined conflict.

John Dos Passos (1896–1970) and Edward Estlin Cummings (E. E. Cummings; 1894–1962) were two other notable men who were considered members of the Lost Generation. In Dos Passos's great trilogy, *USA* (1937), he depicted American life up to 1929. He shared Hemingway's concern for the direction of society. In *USA* he attacked American materialism, pettiness, and hypocrisy. In a similar fashion, Cummings used poetry to challenge what he saw as restrictive convention. He challenged all accepted conventions, even language and punctuation. Using wit and satire, he challenged social norms and customs. Both writers shared the conviction that crusading idealism was not the solution.

More than any other novel, F. Scott Fitzgerald's *The Great Gatsby* came to define the literary movement. Jay Gatsby, the book's protagonist, attempted to win the love of

a woman whom he admired by attaining immense wealth and fortune. When he achieved all that he aspired to, he finally realized that the world is built on fraud, cruelty, and deception. This world, which he adopted in the pursuit of wealth, eventually killed him. The book was a fitting metaphor not only for the times, but also for the life of Fitzgerald himself. He was immensely popular and achieved the acclaim of which others merely dream, but it was not enough. He longed for substance and meaning.

Many of the members of the Lost Generation abandoned the United States in search of meaning. Some moved to France. As a result, Paris became the home for many American writers. Others found their sanctuary in the primitive surrounds of the American West. No matter how far they moved from the society that seemed to alienate them, they could not escape. The world war and its consequences haunted society and reshaped American culture.

### Ludlow Massacre (1919)

One of the longest and most violent labor disputes in the 20th century, the Ludlow Massacre occurred in 1914 when private security forces and National Guard troops attacked striking mine workers in Ludlow, Colorado. The miners were living in a tent city after the Colorado Fuel and Iron Company had evicted them from company-owned homes. The attack left 32 people dead, including nine children. The incident sparked public outcry against employer violence and prompted government investigations into workplace violence.

Labor violence was a common occurrence in the turn-of-the-century United States, but nowhere was it more prevalent than in the nation's mines. Mine operators, intent upon maximizing profits, worked to increase production and keep labor costs as low as possible. Efforts to introduce new technology and to aggressively resist organized labor accomplished the task. Hostility between mine workers and mine operators was particularly intense in western mining communities.

The Ludlow conflict began when the UNITED MINE WORKERS OF AMERICA (UMWA) began an organizing drive at the Colorado Fuel and Iron Company, owned by JOHN D. ROCKEFELLER, Jr. Faced with competition from the more radical Western Federation of Miners and

the INDUSTRIAL WORKERS OF THE WORLD (IWW), the UMWA found organizing western miners difficult. Union leaders, however, were determined to organize in the West and steadily gained new members between 1900 and 1913. Relations between workers and mine operators in Ludlow had been strained for more than a decade. Company officials resisted attempts to organize and brought in immigrant workers to divide miners along racial and ethnic lines. Living conditions were made more difficult, because workers were required to live in company housing and shop at the company-owned store at inflated prices. Many miners found themselves perpetually in debt.

In September 1913, miners ignored the pleas of union officials for moderation and voted unanimously to go on strike. Company officials responded to the strike by evicting between 11,000 and 13,000 workers and their families from company housing, forcing them to live in a makeshift tent colony just as the harsh Colorado winter set in. The company proceeded to attempt to undermine the strike by hiring replacement workers and an armed private security force from the Baldwin-Felts Detective Agency. Colorado's governor, Elias Ammons, attempted to keep the peace by calling in the National Guard, but the miners quickly grew suspicious of the troops when company officials agreed to pay for their expenses. In exchange, troops protected strikebreakers and harassed and intimidated striking miners. The arrest and deportation of legendary labor leader Mother Jones intensified the conflict. Over the course of the long winter, numerous fatalities occurred, prompting Governor Ammons to remove all but a company of troops.

The troops that remained in the spring of 1914 were under the direction of Lieutenant Karl Linderfelt. Intent upon breaking the strike and punishing Louis Tikas, one of the strike leaders, Linderfelt and his National Guard troops attacked the tent colony on April 20. Facing gunfire throughout the day, miners and their families attempted to flee or take shelter. Linderfelt entered the colony and ordered his troops to set fire to what remained of the tents. When the smoke cleared the next day, the tent colony lay in ruins. Thirty-two miners had been killed, including two women and nine children who had been smothered by the blaze as they attempted to hide. Although Linderfelt and others involved in the massacre eventually were found guilty, their punishment amounted to no more than a slap on the wrist.

Throughout the country, workers and the general public were outraged. The UMWA pleaded with others in the labor movement to come to the defense of the striking miners. Guns, ammunition, and money flooded in, as did armed miners from the entire region. Violent clashes continued throughout the month until President WOODROW WILSON sent federal troops into the region and ordered both sides to disarm, ending the violence. Despite scath-

ing criticism and a congressional investigation, mine owner Rockefeller insisted that, while the loss of life was regrettable, the goal of maintaining the open shop justified the actions of company officials and the National Guard. The Wilson administration, though shocked by the behavior of the National Guard and Rockefeller, refused to side with the striking workers. In December 1914, more than a year after it began, the strike ended in defeat. The violence used to defeat the striking miners is indicative of the difficulties that faced workers and the labor movement throughout the Progressive Era.

### **Lusitania** (1915)

At 2:15 P.M., on a clear but cold day off the Old Head of Kinsale in Ireland, near Queenstown, RMS *Lusitania* was struck amidships on the starboard side by a torpedo fired from a German submarine. Eighteen minutes later, the ship rolled on her side amidst a great burst of steam and quickly slid beneath the surface, taking 1,198 passengers and crew with her. The sinking of the *Lusitania* was one of the major incidents that aroused public sentiment against Germany during WORLD WAR I and helped prompt the U.S. entry into the war.

Owned by the British Cunard Line, RMS *Lusitania* was built in 1907. She weighed 31,950 tons, and won the Transatlantic Blue Ribbon on her maiden voyage with a cruising speed of 25.88 knots. The ship's lines and speed inspired her description as "Greyhound of the Seas." With the advent of World War I, the *Lusitania* continued her transatlantic sailing under the auspices of the Cunard Line, but, under a 1902 agreement with the British government, the ship had been modified to take up her role as an armed cruiser beginning in May 1913.

On May 1, 1915, the *Lusitania* set sail from New York City for Liverpool, England. On the shipping news pages of many newspapers, the Imperial German Embassy in Washington had printed the famous warning of Germany's unrestricted submarine warfare with the now-tragic caveat of "travelers sailing in the war zone on ships of Great Britain's on her allies do so at their own risk." Submarine warfare represented a sharp departure from past practices of sea warfare and a violation of international law. The rules of warfare required belligerent ships to stop their prey at sea and confiscate or destroy contraband. Belligerent ships had no right to destroy a ship if it was neutral, and naval officers were required to assure the safety of all aboard. Germany,

in its own defense, claimed that British ships could easily target its U-boats, if they surfaced.

Approaching the coast of Ireland six days after setting sail from New York, the *Lusitania* was warned by the British Admiralty of submarine activity. Captain William Turner received six warnings in all, the latest at 11:52 A.M. on May 7. The ship failed to avoid headwinds, steer a mid-channel course, and operate at full speed. By 1:20 P.M., Captain Walter Schwieger, commanding the *U-20*, sighted the *Lusitania* and fired upon the ship. A little over an hour later, the lives of over a thousand people, including 120 Americans, were lost. The incident was particularly

significant because it sparked an incredible wave of anti-German resentment in the United States and helped draw the United States into a war to protect American interests and honor.

## **Mann Act (1910)**

One of the first federal laws that granted police powers to the federal government, the Mann Act sought to outlaw the transportation of women across state lines for the purpose of prostitution. Officially known as the White Slave Traffic Act, the Mann Act became known under the name of its sponsor in the House of Representatives, James Mann of Chicago. The act made it a felony crime to transport knowingly any woman or girl in interstate commerce or foreign commerce for the purposes of prostitution or debauchery or for any other immoral purpose. It also made it a crime to procure or obtain a ticket to be used by a girl or a woman for prostitution or immoral purposes. A third provision made it a felony to coerce a woman or girl for immoral purposes and imposed a stiffer penalty if the victim was less than 18 years old. The final provision stated that any person who kept, maintained, controlled, or harbored a foreign-born girl or woman for prostitution or immoral purposes, within three years after she entered the United States, was required to file a statement with the U.S. Commission of Immigration and Naturalization.

In passing the Mann Act, Congress was responding to a sense of crisis that existed among reform-minded organizations and people. Many Americans believed that young women were being forced into prostitution in America's large cities. This fear became acute during this era because young women were moving from rural areas to America's cities in search of jobs. This movement occurred at the same time as the tremendous increase in emigration from southern and eastern Europe, an increase that went predominately to cities and so increased the fear of cities in the minds of many Americans. Cities seemed even more frightening and dangerous than ever before because of the foreign nature of their inhabitants. A series of articles in newspapers and magazines detailed stories of women who were abducted and forced into prostitution after coming to the city. The usual story line was that a young woman accepted a drink from a stranger that turned out to be

drugged. In most of the stories, the man or woman who drugged the victim was foreign-born. When the woman awoke, she found herself captive in a brothel where she was forced to live the life of a prostitute. The white slavery panic was built on sensationalist accounts of these episodes. Despite the fact that there was little hard evidence to support claims that an organized conspiracy to enslave young white women existed, reformers called for the creation of laws aimed at combating a supposed conspiracy.

The power of the white slavery panic led lawmakers to override their fears of the expansion of federal law enforcement powers. The Mann Act was passed on the basis that the commerce clause of the Constitution granted the federal government the power to regulate the transportation of prostitutes across state lines. Initially the bill faced opposition from southern congressmen who feared the imposition on states' rights, but many who initially opposed the bill voted for its passage because they believed that the threat to America's young women outweighed their concerns about states' rights. The U.S. Supreme Court found the Mann Act constitutional in a 1913 decision, based on the power granted to the federal government by the commerce clause.

Because the act included the ambiguous phrases "immoral purposes" and "debauchery," law enforcement officials were able to interpret the act and apply it to many actions that did not involve forcible coercion into prostitution. Many local officials used the law to punish people who they believed were challenging the accepted norms of behavior. In the 1910s, many cases were prosecuted in which no prostitution was involved, but in which law enforcement officials had decided that transportation across state lines for immoral purposes had occurred. Some of these came before the Supreme Court and in each case the Court upheld the right of law enforcement officials to interpret the act to include these offenses. In the most public and infamous case of the era, heavyweight boxing champion Jack Johnson, an African American, was

charged in 1912 for bringing a white woman from Minneapolis to Chicago to become his mistress. These charges were dropped for lack of evidence, but the Department of Justice's Bureau of Investigation tracked down another companion of Johnson's who had crossed state lines with him. Based on this evidence, the court convicted Johnson and sentenced him to prison.

### Mann-Elkins Act (1910)

The Mann-Elkins Act was part of the Progressive Era effort to regulate destructive competition and unfair trade practices. In the spirit of PROGRESSIVISM, President THEODORE ROOSEVELT had promised a Square Deal for ordinary Americans in his presidential election campaign of 1904. Previously, he had shown his willingness to rein in corporate abuses of power when he used his executive power to intervene in the ANTHRACITE COAL STRIKE of 1902. The threat of sending federal troops resulted in a compromise between the UNITED MINE WORKERS OF AMERICA and the mine owners, which gave the workers a wage increase and nine-hour day but did not demand recognition of the union. While the government had a practice of acting primarily on behalf of employers in industrial disputes, the Roosevelt administration's threat to seize the mines and continue coal production signaled a major shift in the role of the federal government as an impartial arbitrator. It also marked a change in government regulation of the railroad industry, which owned most of the anthracite mines.

The history of railroad regulation was an inconsistent one. By the 20th century, a series of legislative acts, passed to regulate railroads, were largely unenforceable. Yet the legislation demonstrated the enlarged federal power to regulate corporations. In 1887 Congress had passed the Interstate Commerce Act, which established the Interstate Commerce Commission (ICC) to regulate railroads, but the ICC's powers had been constrained by the courts over the years. In 1903 Roosevelt pushed the ELKINS ACT through Congress, which prohibited discriminatory railroad rebates. In 1906 Congress passed the HEPBURN ACT, which empowered the ICC to set maximum rates once a shipper filed a complaint.

Roosevelt's successor, WILLIAM HOWARD TAFT, worked to attain the previous administration's unfulfilled goals, in particular, railroad regulation. Taft signed the Mann-Elkins Act of 1910, which strengthened the regulatory power of the ICC. Extending the ICC's power over railroads, the act gave the ICC the authority to suspend rate

increases without waiting for complaints from shippers. It set up the Commerce Court to hasten the settlement of railroad rate cases. In addition, the act placed telegraph, cable, and telephone companies under ICC control.

Railroad regulation had enlarged federal power over the industry. Ultimately, however, the ICC's record of enforcement remained unsatisfactory. By 1910, the railroads' voluntary efforts, not federal regulation, had curbed unfair rate-setting practices—the companies agreeing among themselves to set uniformly higher rates.

Although Taft supported regulatory legislation that Roosevelt had been unable to pass through Congress, Taft thought that Roosevelt had abused executive power. Because he refrained from using the tactics of Roosevelt and had a hands-off style of leadership, Taft was viewed as a less effective president. Despite the public perception of a weakened administration in the White House, Taft managed to pass the Mann-Elkins Act, a law that increased the power of the federal government to regulate the railroad industry.

### marriage and family life

In 1899, many Americans were shocked by the news that the United States had the highest divorce rate in the world. To many observers, the news was a sign that the American family was in danger. If the family was at risk, then America's entire social order faced uncertainty. Much of the fear surrounding the family arose from the profound changes taking place in the first decades of the 20th century. Many Americans believed that the family was in crisis. Industrialization, urbanization, immigration, feminism, and the expansion of the state led to changes in the roles of men, women, and children in the family. Despite the shrill pronouncements of many observers, ordinary people were not denouncing the family. They had simply begun to change their behavior and to ignore what had become an outdated family ideal.

Many of the changes that occurred after 1900 were a result of tensions between family ideals and practical realities. Family form and functions changed in response to a complex set of circumstances, chief among which were the effects of economic class and ethnicity. Thus, middle-class families in which the husband worked in a profession might have differed greatly from a working-class family in which both the husband and wife worked.

Most of the fears in regard to families arose from the middle class. The middle-class family ideal popular at the turn of the century centered on the home as a refuge from the world of commerce and trade. Ideally, men were to venture forth into the immoral and dangerous world to support the family, while mothers and children were to stay in the home and thus be protected from the world. This ideal of the middle-class family rested on the woman as the moral center of the family. It was her role to exert a moralizing influence on her husband and to raise her children. Many observers proclaimed that the middle-class family, which—they argued—formed the backbone of the American social order, faced imminent danger from a variety of forces acting to pull it apart.

The new family ideal of the early century emerged from a rapidly changing economic environment. Large-scale industrialization and commercialization were reshaping the work lives of many Americans. For non-farm families, work was completely removed from the home, which meant that workers of all classes were out of their homes and apart from their families for most of the day. At the turn of the century, for example, a typical industrial laborer worked 59 hours per week. Long hours often had a negative effect on family life. Fathers and—in the case of many working-class families—mothers were not always present in the home to parent their children. In middle-class families, the new wage economy meant that the mothers were in charge of raising the children. For some working-class families, the mother filled the same role. In the working-class families, care for children was often undertaken by older siblings or neighbors. The new economy also provided greater job opportunities for young women. Teenaged women could work in the factories, the newly created department stores, or in clerical jobs. Paid work opened up a new world for young women who traditionally had remained in the home to help out with domestic work. Their new independence often led to tension between the young women and their families.

The expanding cities that accompanied industrialization shaped family life. Cities offered new social opportunities for children outside their families. Commercial dance halls, pool rooms, amusement parks, and movie theaters provided space where youths could meet and socialize away from their parents. In these new venues, youths developed their own subcultures based on their shared values. In turn, they distanced themselves from their families. It was not only large cities, however, that experienced these changes. Age-segregated leisure surfaced even in small cities, like the Muncie, Indiana, of *MIDDLETOWN*.

The tremendous increase in immigration affected the family. Middle-class Americans feared that the increase in immigration, particularly from eastern and southern Europe, would overwhelm native-born, white American

Photograph of a woman and children reading by Gertrude Käsebier, ca. 1900 (*Library of Congress*)

families. The declining birthrate among white native-born Americans contributed to the fear that uneducated immigrants eventually would outnumber and overrun the educated population. The idea of “race suicide” helped spur anti-BIRTH CONTROL campaigns aimed at convincing native-born, middle-class women to have more children. Despite these campaigns, the birth rate continued to drop, and birth control use increased.

The birth control campaigns were a reaction to new, emerging roles for women. As more middle-class women went to work outside the home, observers feared that America’s children were endangered. Between 1890 and 1910, women’s enrollment in colleges tripled. Their participation in the workforce doubled between 1890 and 1900, and it increased by 50 percent between 1900 and 1910. In addition, women expanded their public activity by creating women’s clubs and other organizations that played an important role in the reform movements of the Progressive Era. The WOMAN SUFFRAGE movement lobbied for women to have expanded rights. It succeeded in passing and ratifying the Nineteenth Amendment, which gave women the right to vote, in 1920. Critics of the women’s movement argued that women’s participation in public life threatened

the future of the country. If women were working or engaging in social reform activities, they could not be at home with their children. Children, the critics claimed, were growing up without proper guidance and socialization.

In response to these changes, many states sought to toughen their divorce laws. Throughout the 19th century, states had made getting a divorce easier, but others allowed divorce only on account of adultery, desertion, or physical cruelty. South Carolina outlawed divorce all together. In the Progressive Era, these laws became stricter, and many states tried to prevent divorces by preventing bad marriages. States passed laws outlawing marriages between men and women who suffered from drunkenness, venereal disease, addiction, and mental defectiveness. Other states raised the age of consent. These laws did not have the desired effect. Men and women seeking a divorce simply pretended to meet the requirements set down in the laws. Thus the divorce rate continued to rise even after the tightening of restrictions.

Government intervened in private life in new ways in an effort to save the American family. Most of these interventions focused on promoting the nuclear family ideal in which fathers worked, mothers were housewives, and children went to school until they were 15 or 16 years old. Most states passed women's maximum hour laws that restricted the hours women could work. The purpose of these laws was to ensure women's health, but a side benefit was that mothers might be able to be at home more frequently, particularly when children were home from schools. Many states began to offer MOTHERS' PENSIONS, which supplemented women's income as a means of keeping widow's families together. Although these programs had little impact, they demonstrated the commitment that Americans felt toward saving the American family.

States intervened in the lives of children in other ways to promote the nuclear family. They passed CHILD LABOR laws and compulsory school attendance laws so that working-class children were required to attend school. Compulsory schooling laws were partly an attempt to remove immigrant children from their homes, because educators believed that the schools provided a better environment for socializing children. Teaching children appropriate values in home economics was one way to shore up the family. These efforts failed to engender the nuclear family ideal. The inability of many working-class men to earn enough money to support their families was the major reason. Women and children often worked, therefore, out of necessity.

Family life was affected by mass-production industry in a different way. The increase in industrial jobs led to a decrease in the number of women who were willing to work as domestic servants. Many middle-class families had employed servants in their homes. Domestic service jobs

were not as appealing, however, as jobs in factories and stores. Middle-class families faced a shortage of domestic servants, which meant that middle-class women had to do housework themselves. The shortage of domestic help led to efforts to professionalize domestic labor and increase public education in the domestic arts. Advocates hoped that professionalizing housework would convince women to remain home rather than work for wages. It further led to the rationalization and scientific organization of housework by introducing home appliances in order to reduce the labor involved in housework. New appliances such as electric vacuums and washing machines did not, however, release American women from housework. As appliances made cleaning more efficient, standards of cleanliness and hygiene were raised. American women experienced an increase in the time spent cleaning their homes. While work hours dropped, men did not engage in any new domestic labor. Thus, a majority of American mothers maintained their role as the principal provider of home labor.

The family ideal changed in regard to the purpose and place of family life. Families had been stripped of many of their educational, economic, and welfare functions. In their place, society assigned the family primary responsibility for fulfilling emotional and psychological needs of its members. This shift gave rise to a model of marriage called companionate marriage. Before this time, religious obligation, economic need, or moral pressures often held together marriages. Companionate marriage was to be held together by romance, equal rights, and affection. Psychologists, educators, and social service professionals popularized the new conception of marriage early in the 20th century. Relationships between parents and children also changed. Families were still supposed to provide a stable environment for children but added to this traditional role was emotional satisfaction. Children gained the right to express their feelings and to interact freely with their peers. The family ideal thus centered on nurturing emotional well-being in its members.

Paradoxically, as families grew closer emotionally, older children were gaining freedom outside their families. The creation of youth subcultures gave children the ability to define themselves outside of their family. By the 1920s, children identified more with peer groups than with families. This was particularly true for middle-class teen-aged children, for whom high school education became universalized. High schools became the site in which youth subcultures were created and expressed. Working-class youths also enjoyed more freedom from family control. Many working-class parents allowed their children to keep some of their pay, rather than demanding that they turn over the entire paycheck to the family. The practice gave youth money with which to pursue leisure activities.

Younger members of the family, therefore, were breaking away from the family.

Younger children faced a changing environment as well. In the Progressive Era, experts on children published countless books and articles on the proper care and rearing of children. They recommended that parents set strict sleeping and eating schedules for young children and advised parents to wean and toilet train their children early. Experts told mothers not to play with or fondle their children, because it would instill a desire for sensual gratification that would place a strain on a child's nervous system. By the 1920s, a new set of experts emerged who strongly rebuked the rationalized style of childrearing. They advocated a more permissive style of parenting. Parents were encouraged to use a reward system to encourage proper behavior. Many experts still recommended, however, that parents—and particularly mothers—avoid too much affection, for the fear that it would spoil children. In the 1920s, a third group of experts argued that childrearing should be aimed at developing well-adjusted personalities. They warned that stifling childish instincts and actions could permanently damage a child. Educators such as JOHN DEWEY and Maria Montessori argued that children's innate curiosity and independence should be encouraged.

By the end of the 1920s, the emergence of mass media, the common experience of living in an industrial society, and the rise in real wages for many workers led to a more homogeneous family model across class lines. The nuclear family became the ideal family. Although there was never a time when every family in America fit into that model, it was becoming more widespread.

### The Masses

Associated with the Bohemian SOCIALISM of GREENWICH VILLAGE, *The Masses* was a radical journal that reflected the political and cultural changes of its time. The political, economic, and social turmoil of the early 20th century was transforming American society. Between the end of the Civil War and the end of WORLD WAR I, the country went from being a largely rural agrarian society to an increasingly urban industrial one. These transformations helped give rise to a variety of progressive, socialist, and radical political movements in the early decades of the new cen-

tury. Changes in print media also played an important role in enabling these radical political movements to get their message to an increasingly large audience.

The most significant transformation in print media was the emergence of investigative journalism, associated with the MUCKRAKERS. Magazines and journals such as *Collier's*, *McClure's*, *Everybody's*, and *The Nation* began running articles exposing political and corporate corruption. They became immensely popular among the general public and pressured politicians and business leaders to enact important reforms. The popularity of the new political magazines skyrocketed. By 1906 circulation among the 10 most popular magazines publishing investigative reports topped 3,000,000.

Socialist and radical groups, with whom many investigative journalists had close connections, quickly realized the potential the print medium had to vastly expand the audience they were able to reach. Among the most well-written and effective magazines in the newly emerging radical press was *The Masses*. Established in 1911 by Piet Vlag, *The Masses* largely reflected the views of its Marxist editor, Max Eastman. Between 1911 and 1914, a veritable who's who of the political Left published in the pages of *The Masses*. The journal quickly became one of the leading progressive voices in the country. Contributors to the magazine included UPTON SINCLAIR, JOHN REED, Mabel Dodge, Randolph Bourne, and others. Eastman and others on the staff believed that the war in Europe was nothing more than a conflict between competing factions of capital. Between 1914 and 1917, its writers lampooned both the Allied and Central powers and strongly advocated that the United States remain neutral.

After the United States entered World War I, the magazine's editors came under intense pressure to change its stance on the war. When Eastman refused, the postmaster general banned the magazine's distribution, and legal action was initiated aimed at shutting the magazine down permanently. Other radical and progressive magazines, such as *The Nation*, found themselves under intense pressure to support the nation's war effort. Even after the war ended, the federal government continued to place radical and progressive magazines under surveillance for their support of the RUSSIAN REVOLUTION, sexual radicalism, and outspoken criticism of the United States. *The Masses* and the RADICAL AND LABOR PRESS tapped into a strong undercurrent of social inequality and utilized innovations in the print media to achieve an unprecedented level of exposure and support for radical and progressive causes.

**mass production**

The introduction of the mass production of consumer goods fundamentally transformed virtually every aspect of American society between 1900 and 1930. Mass production allowed manufacturers to create economies of scale. In other words, they were able to make larger profits from selling more goods at a lower price than by selling goods at the highest price possible. Mass production also emphasized the use of machinery to produce interchangeable parts. These machine-produced parts and products created goods of uniform quality. Prior to the introduction of mass production, goods were frequently created by hand one at a time and varied greatly in quality. The concept of mass production was hardly new. Eli Whitney had adopted it in the manufacturing of flintlock guns in 1798. What was new at the turn of the century, however, was the extent to which American industry was committed to the idea of mass production. When the idea of mass production was joined with new ideas about SCIENTIFIC MANAGEMENT, the result was

a revolution in the way goods were produced and the economy functioned.

Beginning in the late 1890s, American manufacturers were determined to implement the ideas of FREDERICK WINSLOW TAYLOR. Often referred to as the father of scientific management, Taylor argued that if manufacturers streamlined their operations, eliminating any waste or inefficiency, they could dramatically reduce the time it took to produce goods. This in turn would enable them to reduce the cost of the products. Taylor and his team of university-trained experts used stopwatches to time every aspect of the production process and then recommended ways to improve efficiency. At the same time, Taylor encouraged manufacturers to break down the production process into repetitive tasks. The performance of these tasks required some skill, but it did not require workers to understand or master the entire process.

The introduction of scientific management to mass production resulted in numerous advantages. Mass-produced

Ford's first moving assembly lines at Highland Park (Hulton/Archive)

goods often had interchangeable parts. This made it easier for consumers to repair broken items. In addition, the division of work into isolated and repetitive tasks allowed employers to exert greater control over the entire production process and the workforce. Prior to the widespread use of mass production, skilled artisans, who often took years to learn their craft, produced goods. Watchmakers, for example, created an entire watch step-by-step. Control over the pace and quality of the work was largely in the watchmaker's hands. When watches began to be mass-produced, workers used machines. Responsible for producing only one part of the watch, they now repeated the same task over and over. The loss of specialized skill and knowledge, often referred to as deskilling, weakened the position of skilled workers.

Automobile manufacturer HENRY FORD perfected the mass production system. Obsessed with mass-producing affordable automobiles, Fords spent years streamlining and routinizing his assembly line production process. Instead of having workers assemble one car at a time, Ford employees assembled the car in the stages, as conveyor belts brought the automobile through various workstations. After years of experimentation, the opening of the Highland Park plant in 1910 was the culmination of Ford's efforts and set a new standard other manufacturers quickly attempted to imitate. The results were startling. With the opening of the Highland Park plant, the time it took to produce a finished Model T Ford dropped from 12 hours to an hour-and-a-half. Ford now turned out 600 new Model Ts a day. The result was that Ford was able to sell a high-quality automobile at a lower price than his competitors. By 1921, the company controlled 55 percent of the automobile market. Other manufacturers rushed to follow suit, forever altering the way goods were produced.

The widespread use of mass production transformed the economy. Consumers could now afford to purchase high-quality products at affordable prices. The Model T Ford, for example, was well built and sold for only \$850 when it was introduced in 1908. As Ford continued to streamline production and manufacture and sell more cars, the price of the Model T continued to drop until it cost only \$290 in 1927, making it affordable to all classes. In some ways, mass-produced goods helped create a more homogeneous society. Customers who bought a Model T got the same black, four-cylinder, no-frills automobile in Maine as they did in Michigan. Mass production also changed the American workplace. The pace of work increased dramatically as machine operators performed routine tasks over and over. Industrial jobs became faster-paced and more tedious. Finally, companies that mass-produced their goods were able to realize an advantage over their competitors and to quickly dominate entire industries.

**McKinley, William** See VOLUME VI.

### **McNary-Haugen Farm Bill (1926)**

Supported by the powerful Farm Bloc in Congress, the McNary-Haugen Farm Bill was designed to increase government support of farm commodity prices during the long farm depression of the 1920s. During that decade, the agricultural sector experienced a sustained economic decline. Farm commodity prices dropped not only from wartime highs but also from the stable prices of the period between 1909 and 1913. Farm bankruptcy and tenancy rates were on the rise. Each year, farmers improved less land and cultivated fewer crops, despite their economic dilemma. Farm organizations such as the American Farm Bureau added thousands of members, but they—like their urban counterparts—had little leverage in determining the price of commodities or methods of distribution. Organized farmers began to clamor for some form of government intervention in the guise of loans, price supports, or government regulation of the market.

The goal of radical farm organizations in the 1920s was to achieve parity pricing (prices equal to prewar prices) through government intervention. Working with Secretary of Agriculture Henry C. Wallace, Senator Charles McNary of Oregon and Representative Gilbert Haugen of Iowa introduced a bill to raise farm prices in 1924. Known as the McNary-Haugen Farm Act, the bill proposed that a Federal Farm Board be created to buy agricultural surpluses and hold them off the market until prices rose. The bill also empowered the new Farm Board to sell goods overseas, should prices remain stagnant. The problem with AGRICULTURE, the sponsors argued, was that postwar deflation of prices and increased debt loads had endangered the family farm, the backbone of American democracy. Farm bankruptcies and growing farm tenancy were signs of the overall decline in the agricultural economy. Introduced into CONGRESS in 1926, the McNary-Haugen bill featured government price supports of agricultural commodities to equalize farm prices by selling surplus agricultural commodities on the world market at lower prices than they would receive domestically. The measure was defeated.

In 1927 and in 1928, Congress narrowly passed the McNary-Haugen bill. Although his own secretary of

agriculture helped to author the bill, President CALVIN COOLIDGE vetoed it both times, arguing that it illegitimately put into place a system for fixing agricultural prices. It was, he argued, “calculated to injure rather than promote the general welfare.” He objected in particular to the provisions of the bill that charged farmers fees for government expenditures in purchasing farm surpluses. Introduced once again in 1929, the bill was vetoed by the new president, Herbert Hoover. There were not enough votes to pass it, even when farm prices began to drop again in the late 1920s. Within the Farm Bloc itself, extensive intervention in commodity markets was a divisive issue. The Farm Bureau, like the AMERICAN FEDERATION OF LABOR, often preferred voluntary economic solutions, rather than government ones. As a result, while the McNary-Haugen Farm Bill drew support from various sectors, the direction of farm policy remained limited to government support for farm cooperatives and marketing, in such laws as the CAPPER-VOLSTEAD ACT of 1922 and the AGRICULTURAL MARKETING ACT of 1929.

### McPherson, Aimee Semple (1890–1944)

*Pentecostal evangelist*

A popular evangelist and founder of the International Church of the Four-Square Gospel, Aimee Elizabeth Semple McPherson was born in Salford, Ontario, Canada, on October 9, 1890. She was the daughter of James Morgan Kenney, a Methodist farmer, and his second wife, Minnie, an orphan who had been raised by a Salvation Army family. In 1908, at age 18, Aimee married Robert Semple, an Irish Pentecostal evangelist. She converted to Pentecostalism and joined her husband on tour. On a mission to China in 1910, Robert took ill and died, and Aimee became a widow. She gave birth to a daughter, Roberta Star, shortly thereafter. In 1912, Aimee Semple married Harold McPherson, an accountant. After she gave birth to a son, Rolf, in 1913, Aimee became depressed. Believing herself called to preach, she left McPherson to become a traveling evangelist. She believed that she heard voices calling her to the ministry, and her experience of baptism in the Holy Spirit and speaking in tongues gave her the authority. In 1919, she moved to Los Angeles with her mother and two children. For the next few years, she remained a road evangelist and traveled with her mother Minnie across the country.

McPherson's ministry offered her followers a new version of Pentecostalism. She preached on the four roles of Jesus Christ as healer, baptizer, savior, and returning

Aimee Semple McPherson (Library of Congress)

king. With this message, McPherson gained the financial support and personal loyalty of thousands she converted and others who found her a compelling personal presence. In 1923, after years of preaching in tent revivals on the road, McPherson opened her Angelus Temple with 5,300 seats in Los Angeles. She continued to draw large crowds to her services, and she finally incorporated her church as the International Church of the Four-Square Gospel in 1927.

McPherson's popularity was based in part on her relentless innovation. Drawing upon new technologies to “get out the word,” she traveled the country in her revival days in the “Gospel car.” She used the vehicle as part-pulpit and part-advertising billboard, and it carried her message:

“Jesus is coming soon; get ready.” McPherson also integrated jazz music, stage theatricals, and even opera into her services, and she became one of the first evangelists to use the RADIO as a “wireless telephone” to reach the masses. She opened a Bible school in 1923, to preach her own version of the Pentecostal gospel. In 1924, she bought a radio station, which she dubbed KFSG for “Kall Four Square Gospel.”

In 1926 McPherson disappeared while on holiday. When she reappeared a few days later, she claimed to have been abducted. Newspapers reported that they had discovered a love nest in Carmel, California, which McPherson shared with a former KFSG radio engineer, Kenneth Ormiston. Put on trial under the charge of perjury, McPherson convinced the jury that she had been telling the truth about the kidnapping. She was acquitted, but never again did she have the same popularity. During the Great Depression, she opened a soup kitchen at her church and did other community work. McPherson continued her ministry for the rest of her life. She died in 1944, the victim of an accidental overdose of sleeping pills.

### **Mead, Margaret** (1901–1978) *anthropologist*

One of the most important public intellectuals of the 20th century, anthropologist Margaret Mead was and is a figure of both admiration and controversy. She was a prolific writer of 44 books and hundreds of articles, many written for popular audiences. Mead became best known for her work on adolescence and child care in other cultures. In landmark books, she advanced the argument that culture, not biology, determined gender identity and sexual behavior. Mead balanced her intellectual courage with wit and humor, making her a sought-after public speaker. By the end of her life, as much cultural icon as intellectual, she appeared on radio and television and published widely in the popular press.

Born on December 16, 1901, the oldest of four children, Mead was the daughter of economist Edward Sherwood Mead of the University of Pennsylvania and Emily Fogg, a sociologist and social reformer. Home-schooled prior to high school, Margaret took her bachelor's degree in psychology at Barnard College in 1923 and her M.A. and Ph.D. at Columbia University (1928). While in graduate school, she married theology student Luther Cressman. They were divorced in 1928.

A student of anthropologists FRANZ BOAS and Ruth Benedict, Mead did fieldwork in American Samoa for her

dissertation. The study, later published as *Coming of Age in Samoa* (1928), argued that the experience of adolescence varied across cultures. A best-seller later translated into several languages, it asserted that the more relaxed childrearing practices of Samoan culture made adolescence and sexual development less conflict-ridden and problematic than in the West. Indirectly, *Coming of Age in Samoa*, like much of Mead's later work, challenged the idea of Western cultural superiority by showing how the West might learn from other cultures.

In subsequent years, Mead returned to the South Pacific. With her second husband, psychologist Reo Fortune, she went on a fieldwork expedition to New Guinea in 1928–29. Mead studied the play and imagination of young children in the region. Based on her research, she published *Growing Up in New Guinea* in 1930. Mead divorced Fortune in 1935. A year later, she married British anthropologist Gregory Bateson, with whom she conducted research in Bali. Together, they wrote a study, *Balinese Character* (1942), which utilized photography in its analysis of culture. Mead gave birth to a daughter, Mary Catherine Bateson, in 1939. Mead later divorced Bateson.

Throughout her career, Mead chose to work at the intersection of academic and popular institutions. In 1926, she took a position with the anthropology department of the American Museum of Natural History in New York City. She worked there for more than 40 years, first as assistant then as associate curator (1942–64), and finally as curator from 1964 to 1969. She joined the Columbia University faculty as director of research in contemporary cultures (1948–50) and adjunct professor of anthropology in 1954. In 1968, she was appointed head of social sciences and professor of anthropology at Fordham University. She served in both official and informal capacities on federal commissions and in international associations, and she testified before Congress and other government agencies.

Mead saw her work as curator of museum collections and exhibits as being on an equal par with her publications and teaching. She was an enthusiastic advocate for women's rights, the environment, child development, and education. A strong believer in interdisciplinarity, she is given credit for combining for the first time psychology with anthropology. Her later works, including *Sex and Temperament in Three Cultures* (1935), *Male and Female* (1949), *New Lives for Old* (1956), and *Culture and Commitment* (1970), kept her ideas before the public. Believing that racism, warfare, and a lack of respect for the environment were learned behaviors, Mead argued that humans had the capacity to modify their paths and create different futures. She published her memoirs, *Blackberry Winter*, in 1972. Her anthropological work was tremendously influential in shaping the opinion both of scholars and of the general public. Mead died in 1978.

### Meat Inspection Act (1906)

The Meat Inspection Act of 1906 was an attempt to regulate the meatpacking industry and to assure consumers that the meat they were eating was safe. By 1900, industrialization had changed food production in the United States. Throughout much of history, ordinary people either raised and slaughtered their own meat or purchased it from local butchers. As the nation became more urban and industrial, however, a national meatpacking industry emerged to capture the market. By 1900, livestock was being raised on large-scale farms and ranches and driven to centralized slaughterhouses in Kansas City and Chicago. Once slaughtered, the livestock was then divided into various cuts of beef and pork, and shipped across the country on refrigerated railroad cars. MASS PRODUCTION and the assembly line were introduced into meatpacking, and livestock was brought to slaughterhouse employees by conveyor belts. As the meatpacking industry changed, giant corporations such as Armour, Wilson, and Swift quickly came to dominate the industry. These large-scale producers attempted to maximize profits by introducing technological changes to increase efficiency and by pushing employers to work more quickly.

Working conditions and the cleanliness of the industry deteriorated as meatpacking companies attempted to increase profits at a time when food prices were steadily declining. Those calling for closer scrutiny of the food processing industry included the American Medical Association and journalists Samuel Hopkins Adams and UPTON SINCLAIR. In 1904, Sinclair published a series of articles in *McClure's* magazine exposing hazards facing slaughterhouse workers and the unsanitary conditions in the stockyards of Chicago. Later that year, he published *The Jungle* (1906), a novel based on his research. The conditions of the Chicago stockyards horrified consumers across the country and led to demands that the government take action to ensure the quality and purity of the nation's meat supply.

Ironically, Sinclair had focused his attention on the hazardous working and living conditions of slaughterhouse employees. The public turned out to be more concerned about the food they were eating. Pressure on the federal government mounted. The Neill-Reynolds report, a Department of Agriculture inquiry into the working conditions and sanitation of the industry, convinced many politicians of the need to act. The proposed legislation, however, was not without its critics. Conservatives in Congress,

including Speaker of the House JOSEPH CANNON, argued that the Constitution did not grant the federal government the authority to regulate industry. The meatpacking industry lobbied aggressively to get the legislation blocked. Public concern, however, convinced President THEODORE ROOSEVELT and progressive congressmen of the need to act. The Meat Inspection Act and the PURE FOOD AND DRUG ACT were both passed in 1906. Concluding that distribution of meat constituted interstate commerce and hence fell under federal jurisdiction, Congress prohibited the sale of tainted meat and authorized the Department of Agriculture to investigate meatpacking plants. The momentum generated by the passage of the Meat Inspection Act helped secure the passage of the Pure Food and Drug Act, which had been stalled in Congress since 1905. With these two pieces of legislation, the federal government took important steps to assure the public that the food they were eating met minimum safety standards and, in the process, restored public confidence.

### medicine

Between 1900 and 1930, significant changes in the medical profession, medical practice, and medical knowledge transformed the health care system in the United States. At the turn of the century, the American Medical Association (AMA) was in its infancy. Only about 7,000 doctors (or 6 percent of medical doctors) belonged to AMA, and most doctors remained independent of professional ties. Jealous medical professionals fought the encroachments of PUBLIC HEALTH departments and competed with each other for patients. Medical licensing was neither widespread nor uniform, and medical education was haphazard. American medical knowledge lagged behind the advancements in Europe and compared badly to Germany, where laboratory SCIENCES were revolutionizing medical diagnosis and treatment. The hospital, long thought to be a house of death, was only beginning its transformation into an institution for the diagnosis, treatment, and cure of disease. By 1930, medicine in the United States would be transformed into the modern system of health care that prevails today.

The turn of the century was a time of great medical discoveries. New bacteriological studies had uncovered the cause of many infectious diseases, including tuberculosis, diphtheria, cholera, typhoid, and rabies. Public health officials attuned to the need for prevention and treatment had begun to clean up city sanitation and educate the public in new standards of personal hygiene. Surgery, which

was scarcely practiced through most of the 19th century, came into its own as a field of medical practice. During this period, antiseptic procedures in surgery sharply reduced patient mortality in operations. By the turn of the century, abdominal surgery had become more frequent as had new surgical operations on the lungs, nervous system, and heart.

A central tension in the development of medicine in the 20th century was the competition that existed between public health needs and the medical profession. Doctors and medical practitioners faced the dilemma of having a professional creed (the Hippocratic oath) that obligated doctors to provide care mated with the economic self-interest of a newly powerful profession. As medical knowledge and treatment improved, doctors were in greater demand. They sought and slowly gained higher fees and salaries, but the problem remained of how to elevate the status and income of the profession, long seen as a mixture of concerned practitioners, traditional homeopaths, and outright quacks and charlatans who promised miracle cures. The only way, in the view of many physicians, was to reduce the supply of doctors and thus increase demand and reward. Doctors sought to achieve this goal by collective organization (the AMA), improvement of medical education and the discrediting of commercial medical schools, and licensing. The AMA reorganized in 1901 in order to create a more efficient system of governance. At the same time, it put pressure on state medical associations to reorganize and coordinate their activities with the national AMA.

The key to controlling entry into the profession, while at the same time improving medical care, was to radically reform medical education in the United States. The first tentative steps in this direction were made in the training of nurses. Reform in nursing education began as early as the 1870s and progressed into the 20th century. The dearth of trained nurses was solved, as the number of nursing schools increased from three in 1873 to 432 in 1900 and 1,129 in 1910. Nursing education came to include many of the same elements of medical schools, including student training in hospitals. The 1923 Carnegie Foundation report on *Nursing and Nursing Education in the United States*, which social investigator JOSEPHINE GOLDMARK helped to write, furthered these trends.

During the 1870s, there was a similar movement to reform doctor education. Harvard University led the way in professionalizing medical education beginning in 1871. Under President Charles Eliot, the university completely revamped its medical school, instituting training in the laboratory sciences of physiology, pathological anatomy, and chemistry, and integrating clinical work. The 1893 founding of Johns Hopkins University Medical School and its hospital was another step forward. The Johns Hopkins program focused on research in the laboratory sciences as well

as clinical work and hospital internships. It was at Johns Hopkins that the term “residency” was first coined when the school implemented the practice of assigning newly educated doctors to practical training. Medical schools expanded the fields of medicine to incorporate public health and OCCUPATIONAL HEALTH AND SAFETY concerns. In 1919, Harvard Medical School hired ALICE HAMILTON, the first woman on their faculty but also the first specialist in the field of industrial medicine. Her books on industrial toxicology would become standards in the field.

Drawing on European models, the innovative medical schools at Harvard and Johns Hopkins led the way for changes in medical education as a whole. The AMA put pressure on state legislatures to implement new standards of medical licensing of doctors and medical schools that required a higher level of both laboratory and clinical education. The elite schools also stretched the requirements for a medical degree from two to five and then eight years, including a hospital internship. The cost of laboratory equipment, adequate library resources, and hospital facilities put many small proprietary medical schools out of business.

The final blow for smaller commercial medical schools was a report issued in 1910. That year, the Carnegie Foundation for the Advancement of Teaching hired Abraham Flexner, an educational reformer, to conduct a survey of medical schools in the United States. Visiting medical schools across the country, Flexner found that there

Public Health Service nurse treating patient (Library of Congress)

were many smaller medical schools that had only made gestures toward meeting the new educational standards. They lacked laboratory facilities to educate students in the clinical sciences of physiology and anatomy. Their libraries lacked books and journals; their faculty largely busied themselves with outside practice. Within a few years, the new state licensing boards, coupled with Flexner's report, had their desired effect. The number of medical schools declined from 161 in 1900 to 81 in 1922. With new and higher standards and strengthening of medical education, the AMA shored up its prestige and the financial rewards of being a doctor, as income steadily increased throughout the period.

As both a school for the clinical training of physicians and as an institution for the treatment of disease, the American hospital went through several changes in the early 20th century. Early hospitals had been places where the poor went for refuge and free treatment and the terminally ill went to die. Most men and women preferred seeing private doctors in offices or homes. Surgery often was performed in kitchens, and doctors oversaw childbirth in the mother's home. In rural regions and poor city neighborhoods, midwives still watched over and sometimes intervened in births. After 1900, the hospital became the venue of choice for an increasing number of middle-class and even working-class patients. Their chief problems had been the lack of trained doctors and the high rate of infection in hospital wards. New antiseptic procedures and greater demand for hospital space by trained physicians changed the profile of the hospital. Reform of medical education made the hospital the place where new medical graduates did their internships, and doctors increasingly used hospital to place seriously ill patients and candidates for surgery. With these changes, there was greater specialization, as hospitals divided labor according to the level of training, years of practice, and reputation of doctors. Modern hospitals no longer depended on availability to attract doctors but rather began to pay fees to private doctors and salaries to those on staff. Moreover, many hospitals became profit-making enterprises.

The modernization of American medicine came at a cost. The constant tension between private doctors and public health departments severely limited the provision of free public health care and truncated many community health initiatives. At the same time, public health programs such as free laboratory testing for diphtheria and tuberculosis and school health programs to diagnose hearing and eye problems and infectious diseases indirectly subsidized medical care. The desire for greater income and higher status for the profession led doctors to close down commercial medical schools that had trained doctors for working-class immigrant, rural, and African-American communities. In general, doctors gravitated to wealthy areas. As one AMA

study showed, more than a third of small towns that had doctors in 1914 had lost them by 1925. In 1906, there was one doctor for every 590 persons; by 1923, this had increased to 910. In large cities, there had been little growth in the numbers of doctors per capita. The shortage of doctors was particularly acute among African Americans. The new standards for accreditation of medical schools had reduced the number of medical schools enrolling African-American students from seven to two. Within a few years of the 1910 report, only Howard and Meharry remained. The consequence for medical care in African-American communities was devastating. In Mississippi, for example, where medical care was segregated by race, there was only one physician in 1930 for every 14,634 African-American residents.

Women in the medical profession were also casualties of the new emphasis on research science and elite medical education. Where the United States once had the highest number of trained women physicians in the world and a relatively high percentage of women went to medical school, after 1910 most medical schools limited the proportion of women students admitted to 5 percent of classes. The number of women medical students dropped by nearly a third. At the same time, professional hostility toward women increased. The AMA, like many professional and academic associations, marginalized or excluded women in its ranks, which meant women received fewer medical referrals, had to pay more in malpractice insurance, and—without AMA support—might never receive, or eventually lose, their license to practice medicine.

With these changes, American medicine entered a new era of medical discovery, treatment, and care. It also faced a future in which private practice and private medical insurance, not public health care and national health insurance, was the dominant mode. It would be decades before development of a health system that reached the mass of the population with preventative treatment and regular care.

### **Mellon, Andrew William** (1855–1937)

*businessperson, politician, philanthropist*

Andrew Mellon was one of the most influential bankers and conservative politicians of the 1920s. He served as secretary of the treasury throughout the decade and earned a reputation for cutting taxes and trimming the federal budget. Born in Pittsburgh in 1855 as the son of Thomas

Mellon, a successful banker, Andrew went to school at what is now the University of Pittsburgh. He left college early to enter into business and soon joined forces with his father and brother Richard to found the firm Thomas Mellon and sons. In 1889, Andrew Mellon established the Union Trust Company of Pittsburgh, which was destined to become one of the largest financial institutions in the United States. Mellon also invested widely and had holdings in the oil, locomotive, bridge construction, electric, coal, public utility, steel, and insurance industries.

In 1921, he resigned as president of the Mellon National Bank to become secretary of the treasury under WARREN G. HARDING, an appointment he held until 1932. As treasury secretary, Mellon had the dismantling of the war-built tax structure as his principal goal. He argued that the nation was “staggering under the existing burden of taxation and debt” and clamored for “gradual relief from war taxation.” He reiterated his proposals to a special session of Congress in 1921, recommending repeal of the excess profits tax. He also called for the reduction of individual and corporate income taxes and surtaxes on income. In the Revenue Act of 1921, Congress repealed the excess profits tax. It further lowered income tax rates in 1921, 1924, and again in 1926. Taxes were reduced from a maximum of 73 percent to 40 percent on income for 1921 and 33 percent thereafter. He published *Taxation: The People's Business* in 1924 to express his tax philosophy.

Despite drastic tax cuts throughout the decade, Mellon's budgetary advice helped to reduce the national debt from over \$24 billion in 1920 to \$16 billion in 1930. His tight budget philosophy, however, had other, negative consequences. When the Great Depression began in 1929, his distaste for deficit spending reinforced President Herbert Hoover's conservative approach to the crisis. As the economy went into a tailspin following the Stock Market Crash of 1929, neither the president nor Mellon could find any justification for federal relief for farmers or the unemployed.

By the end of Hoover's presidency, Mellon had already begun to withdraw from political life. He served briefly as ambassador to Great Britain and left the position when Franklin Delano Roosevelt was elected in 1932. In private life, Mellon had a reputation as a philanthropist. He donated \$10 million to the founding of the Mellon Institute for Industrial Research in Pittsburgh, and later he donated his art collection, and funds for a building to house it, to the federal government. Mellon died in 1937.

**Mencken, Henry Louis** (1880–1956) *journalist, editor, literary and cultural critic*

Henry Louis Mencken (H. L.) was born in Baltimore on September 12, 1880. The son of August Mencken, a prominent cigar maker, Henry Mencken was groomed by his father to become a cigar maker, but he had different plans. The two years that he spent working for his father were the worst years of his life. Only two weeks after his father died, Mencken applied for a position with the *Baltimore Morning Herald*.

Living the life of a cigar worker would have been difficult for Mencken. From early on it was clear that he was exceptionally bright and perceptive. Even during his formative years, he showed a promise that led to his appointment as his high school's valedictorian in 1896. His intelligence and curiosity led him to a career as a journalist. Just three years out of high school, in 1899 he became a reporter for the *Baltimore Morning Herald*. In 1906 he moved on to the *Baltimore Sun* where he worked, on and off, for the remainder of his life.

In 1914 Mencken and George Jean Nathan began editing *The Smart Set*, a witty urban magazine that was a precursor to the *American Mercury*, which Nathan founded in 1924. Mencken was a primary contributor and edited the magazine until 1933. *The Smart Set* and *American Mercury* were two of a growing number of publications that came to symbolize the LITERATURE of the era. They challenged conventional norms with satire and humor. They helped to usher in one of the most noteworthy eras in American literature.

Mencken became one of the foremost social critics of the era. He ridiculed organized religion, pretension, provincialism, and businessmen. In one of his most infamous critiques, he referred to American middle-class businessmen as the “booboisie.” He refused to accept the popularly held notion that successful businessmen were, by definition, better people. This placed him at odds with stalwart defenders of American capitalism. For many, he challenged society itself. On the heels of a scathing critique of American culture, Mencken was asked why he bothered living in a society that he held in such disdain. He simply remarked “for the same reason that people go to the zoo.” Few were free from the wrath of his pen. In an unveiled attack on both American government and lawyers, he complained that “all the extravagance and incompetence of our present Government is due, in the main, to lawyers, and, in part at least, to good ones. They are responsible for nine-tenths of the useless and vicious laws that now clutter the statute-books, and for all the evils that go with the vain attempt to enforce them.”

Mencken criticized the foundations of American society. He did not believe in democracy as it was practiced in the United States. The government, he believed, did not

exist to help its citizens. It, he assured his readers, existed only to promote its own existence and expansion. It was apparent to many readers that Mencken had little respect for the so-called sacred institutions and he thought that Americans, and people in general, were ignorant and selfish. He once noted that, “No one has gone broke underestimating the intelligence of the American public.”

The SCOPES TRIAL proved to Mencken that the American public was unfit for self-governance. Throughout the trial, he lambasted the American people for their ignorance and hatred. He was especially appalled by the fact that Americans seemed to have more faith in what he believed to be the incoherent ramblings of WILLIAM JENNINGS BRYAN than in the poignant, well-articulated arguments made by CLARENCE DARROW. The trial proved to Mencken that the American public was unwilling to accept the truth that was often before them, and therefore unfit to govern themselves. His opinions reflected many of the rural-urban tensions of the time as, in many respects, he exaggerated the strength of support for Bryan’s position.

According to Mencken, PROHIBITION was an even more appalling example of the lack of judgment by the American people. He was convinced that unthinking, self-righteous individuals thrust Prohibition upon society. He was one of the first writers to point out the shortcomings of the amendment. In an article citing many of the failings of Prohibition, he sarcastically acknowledged one of its benefits. He noted that, “five years of Prohibition have had, at least, this one benign effect: they have completely disposed of all the favorite arguments of the Prohibitionists.”

Mencken’s wit and brilliance helped him to forge a literary genre that remains powerful even today, but he was more than one of the most popular writers of the era. He became a celebrity and wrote a number of books. Throughout his life, he remained a steadfast critic of American society. His criticisms were poignant and well articulated, but intolerance, mistrust, racism, and ANTI-SEMITISM also colored them. Mencken had a stroke in 1948 and died in 1956.

## Mexican immigration

The migration of Mexicans north into the United States steadily increased between 1900 and 1930. The number of Mexican immigrants officially recorded as entering the United States grew from 49,000 between 1901 and 1910 to 219,000 from 1911 to 1920, and 459,000 in the 1920s. The ease in crossing the border between the United States

and Mexico has always made it difficult to have an accurate count. Between 1900 and 1930, the number of Mexicans entering the United States far exceeded the “official” count. While a number of factors contributed to the movement of Mexicans north after 1900, much of the migration had its origins as a response to economic development in Mexico under President Porfirio Díaz during the last quarter of the 19th century.

Upon becoming president in 1876, Díaz faced two options for national development: either reorganize the agrarian sector to raise capital internally or leave domestic agriculture alone and turn instead to foreign investors for capital. Díaz favored the latter option. He quickly worked to improve the image of Mexico in an effort to increase foreign investment. In his first major initiative, Díaz expanded the national railroad system. Financed largely by American investors, this project linked the Mexican economy to the world market. Ignoring internal demands for an east-west railroad network, U.S. capital instead built in Mexico rail lines running north-south to ensure better American access to Mexico’s cheap raw materials. The mining district of Sonora, for example, became better linked to the United States than to Mexico City. Moreover, the rail network facilitated the northward movement of Mexican workers displaced from the Mexican countryside. In his effort to modernize the country, Díaz established an export-based economy, making the country dependent on world market conditions. His program of development offered limited benefits to the country as a whole. Rather, the small economic elite received the major economic benefit of Díaz’s policies. By 1910, the country sent 80 percent of its exports to, and received 66 percent of its imports from, the United States.

Although the expansion of Mexico’s foreign trade brought new consumer goods and economic opportunities, widespread dissatisfaction appeared throughout the country. In urban areas, the growing wage labor force worked under extremely poor conditions, and the middle class resented the extent to which foreigners filled new professional jobs. Because the peasant population suffered large losses of land to foreign investors and Mexican elites, they lost their capacity for self-sufficiency. By 1910, the transformation affected nearly all of the rural population, creating an enormous, landless workforce and stimulating a massive migration of rural individuals to Mexican cities. While Díaz’s program of foreign investment increased the wage labor sector, it failed to provide adequate resources or opportunities for laborers and the new landless class. Mexico’s export-based economy further prevented the emergence of a substantial industrial sector that might have absorbed rural to urban migrants. In addition, the country’s population grew by 50 percent between 1875 and 1910. This growth contributed to the limited wage labor opportunities available within Mexico.

The frustration caused by this economic development contributed to the outbreak of the MEXICAN REVOLUTION in 1910. Subsequent political instability motivated many Mexicans to migrate to the United States. Concurrently, the American Southwest (principally Texas, Arizona, and California) experienced rapid economic growth, largely in the labor-intensive areas of agriculture, mining, and railroads. In order to compete in the national market, industries sought ways to minimize their production costs. Because Díaz's economic development had resulted in better transportation connections between the United States and Mexico, American employers increasingly relied on Mexico as a cheap reservoir of both labor and raw materials. By the 1920s, the promise of higher wages easily attracted Mexican laborers to the United States. The average daily wage differed substantially between the two countries. In 1910, male agricultural workers in Mexico could anticipate making between 20 and 25 cents daily while their peers in the United States could expect to earn between 50 cents and one dollar per day. By 1920, the daily wage in the United States had risen to between \$1 and \$2, while in Mexico it remained virtually unchanged.

Higher wages were not the sole reason for the steady increase of Mexican immigrants to the United States during the 1920s. While the federal government enacted legislation that capped the total number of immigrants allowed to enter the United States annually, emigration from within the Western Hemisphere remained untouched by the QUOTA ACT of 1921 and the NATIONAL ORIGINS ACT of 1924. More than 450,000 Mexicans entered the United States during the 1920s, representing nearly 11 percent of the total immigrant population for the decade. In addition, thousands more took advantage of the relatively porous border and entered without the necessary visas. Although the 1924 National Origins Act did not apply any quotas on the number of Mexican immigrants, it did establish the Border Patrol under the authority of the U.S. Bureau of IMMIGRATION. Nevertheless, migrants still found ways across the border under the assistance of "coyotes," as the border-crossing experts came to be known.

For the most part, Mexican immigrants settled in Texas, Arizona, and California. The bulk of the American population was either unaware or unconcerned with this group. Through the 1920s, the response to Mexicans was varied, but it never reached the level of hostility that had been witnessed by Asian immigrants. The volume of Mexican immigration to the United States declined around 1928 as American consulates in Mexico started to enforce the literacy requirements of the IMMIGRATION ACT OF 1917. More than this stricter enforcement, the Great Depression brought a noticeable halt to the movement of Mexicans into the United States. Not only did large numbers of Mexicans voluntarily decide to return home, but also the

United States forcibly repatriated many Mexicans who did not hold the proper documentation when many localities argued that immigrants were a drain on limited resources. The patterns of Mexican migration to fill the employment needs of such industries as agriculture, were well developed from 1900 to 1930. Following the Great Depression, employers in the southwest quickly turned to the federal government to create programs to supply them with sufficient numbers of employees from across the border in Mexico.

### Mexican Invasion (1916–1917)

As an unsuccessful attempt to capture and punish Francisco "Pancho" Villa, a leader of the MEXICAN REVOLUTION, the Mexican Invasion proved to be a costly embarrassment to the U.S. government and to President WOODROW WILSON. From March 1916 to January 1917, 6,000 U.S. Army troops under the command of General JOHN "Blackjack" PERSHING searched for Villa to punish him for the killing of Americans by his forces. Ultimately, the expedition returned to the United States without ever finding Villa.

Pancho Villa was a leader in northern Mexico during the Mexican Revolution. He hoped to institute radical economic change that would benefit Mexico's industrial workforce and its agricultural workers. He initially courted U.S. support during the revolution and did not protest in 1915 when the U.S. Navy occupied Veracruz in an effort to determine the outcome of the revolution. When Woodrow Wilson threw his support behind a competing revolutionist, Venustiano Carranza, Villa launched an effort to punish the United States and Wilson in retaliation for what he saw as betrayal.

Villa's forces first struck in January 1916 in northern Mexico by pulling 15 U.S. mining engineers from their train and murdering them. In March 1916, he sent nearly 500 men to attack Columbus, New Mexico. Villa's men terrorized the town for hours, killing 18 people, injuring scores more, and burning the town to the ground. The 13th Cavalry eventually drove Villa's forces out of New Mexico.

Demands for U.S. intervention to punish Villa were immediate. Some called for all-out war and occupation of Mexico. President Wilson avoided talk of war. Instead, he sent an expedition under General Pershing to capture Villa. Unfortunately for the United States, the organization of the

expedition took one week. By the time the troops entered Mexico, Villa and his troops had covered their tracks. The U.S. Army wandered around Mexico looking for Villa. As they did, they met opposition from rural Mexicans who were the base for Villa's revolutionary movement. As they moved south, the Carranza government, which Wilson helped bring to power, began to see the American troops as a threat and ordered them to withdraw. In fact, the only confrontation during the invasion was between U.S. troops and the Carranza government's troops.

Despite their inability to capture Villa, the U.S. Army had weakened his position in the struggle for power in Mexico. While Villa fled Pershing's troops in northern Mexico, Carranza consolidated power in Mexico City. Preoccupied with Pershing's troops, Villa was unable to challenge Carranza for control of the Mexican government. The Mexican Invasion therefore played a role in the outcome of the Mexican Revolution by helping the pro-U.S. Carranza government consolidate power.

### Mexican Revolution (1910–1917)

The Mexican Revolution refers to a series of armed struggles that occurred from 1910 to 1917 and resulted in the creation of a new constitution under the government of Venustiano Carranza. The United States played an important role in both the cause of the revolutions and the outcome. The hardships created by the revolution also led many Mexicans to immigrate to the United States.

There were many political, economic and social causes of the revolution. Politically, widespread opposition to the 33-year dictatorship of Porfirio Díaz existed. Mexico's rapidly industrializing economy had created severe dislocations for many Mexicans. Díaz's government had pursued industrialization through agreement with foreign corporations, mainly from the United States and Great Britain. By 1911, for example, foreign companies owned the 80 largest commercial and industrial companies in Mexico. Companies from the United States controlled essential industries such as mining, the railroads, oil, electric power, and the telegraph. Many Mexicans believed that the foreign corporations controlled too much of their country's economy.

The expansion of the railroad also played a key role in disenchantment with the Mexican government. As railroads infiltrated new areas, they brought industrial goods and opened up new markets for agricultural goods. This simultaneously put local producers out of business and led to an increase in agricultural production for export, both

of which refocused the economic lives of millions of Mexicans from local concerns to international. These developments caused severe dislocations in rural Mexican society. Simultaneously, the new industrial workers laboring in foreign-owned factories were unhappy with their working conditions and wages. Many members of the middle class also resisted Díaz's economic policies. Business owners disagreed with his policies favoring foreign companies. They wanted both the economic benefits that industrialization brought and the independence from foreign control of their economy. The Mexican Revolution became, therefore, a many-sided affair.

The immediate cause of the revolution was an economic depression that began in 1907. The depression destroyed many businesses, leading to unrest among the middle classes who formed one of the most powerful groups in Mexico. In response to the unrest, Díaz called for presidential elections in 1910. Reversing his earlier promise not to run for president again, he announced his candidacy and arrested his chief rival, Francisco Madero. Madero escaped police custody and fled to the United States, where he called for an armed insurrection against Díaz's government. Mexicans in several regions immediately took up arms.

The forces seeking the overthrow of Díaz coalesced around three leaders: Madero, Francisco (Pancho) Villa, and Emiliano Zapata. All three were fighting for the overthrow of Díaz but with different goals in mind. Villa, whose support came from the industrial north, sought radical economic change to benefit industrial workers. Zapata, who was based in the agricultural south, wanted agrarian reform. Madero and his supporters came from the middle class and hoped to gain control of the economy.

Faced with insurmountable opposition to his regime, Díaz signed a treaty with Madero that called for a new election in October 1911. Madero won the election and became president. He and his military commander, General Victoriano Huerta, quickly cracked down on their former allies in the revolution, killing and imprisoning many of Zapata and Villa's supporters. The military crackdown led to a rebellion against the government by workers and peasants. In 1913, feeling that Madero was not doing enough to quell the violence, Huerta led a coup that ended in the president's assassination. Huerta then assumed the presidency.

Huerta's violent takeover led to another round of violence as different factions fought to overthrow his illegitimate presidency. Villa and Zapata now directed their forces against Huerta. A third force emerged led by Venustiano Carranza, a former governor under Díaz, who sought to protect constitutional government and democratic rights. His followers became known as the Constitutionalists.

At this point, the United States got involved. President WOODROW WILSON enacted a financial blockade and arms

Federalists watching the advance of rebels at Ojinaga, Mexico (Library of Congress)

embargo against Huerta's illegitimate government. The United States also aided the anti-Huerta forces, particularly the Constitutionalists. In 1914, the United States intervened even further by invading the half of Mexico port of Veracruz to stop a shipment of arms from reaching Huerta's forces. For a variety of reasons, U.S. intervention helped the Constitutionalists more than Zapata and Villa. Facing hostile forces from four sides, Huerta resigned on July 8, 1914. Reaching Mexico City first, Carranza and the Constitutionalists reached an agreement with Mexico's largest labor union that gave them overwhelming numerical strength. Carranza was thus able to proclaim himself president.

The revolution then entered a third and final phase that saw conflict between the Carranza government and the forces of Zapata and Villa. With aid from the United States, the government defeated the two rebel forces. The Mexican Revolution left Mexico with a government that came to power with the aid of the United States. Thus, a revolution that began partly as an attempt to reduce the influence of U.S. corporations ended with a government that owed the United States its victory. The revolution also played a significant role in enlarging the Mexican-American population of the United States as many Mexicans fled the inflation, violence, and social chaos of the revolution by immigrating to the United States.

### **Middletown** (1929)

In 1929, sociologists Robert and Helen Merrell Lynd published the groundbreaking study, *Middletown: A Study in Modern American Culture*. The Lynds used sociological methods to examine the lives of ordinary American citizens in a midwestern city, Muncie, Indiana. One of the first community studies, *Middletown* served as a model for sociological research for generations to come. Robert Lynd, a Protestant minister, was committed to the ideas of the Social Gospel, a social movement within American Protestantism concerned with social justice and redeeming the nation's cities. The Lynds' concern about the influence of the modern urban world on traditional Protestant values thus became central to the study of *Middletown*.

The Lynds' study of Middletown was intended to explore how industry, urbanization, and consumption influenced traditional American values in the 1920s. They chose Muncie as their site for research because it appeared to be less affected by these modern forces. Initially funded by the Institute for Social and Religious Research, a John

D. Rockefeller foundation dealing with the preservation of traditional American values, the Lynds purposefully did not choose an ethnically diverse city. Instead, they studied a “traditional vanishing white, Anglo-Saxon, Protestant city, which was . . . the center of old-fashioned American virtue.” The Lynds thought, “The hope for social progress and moral reawakening resided . . . within the original American spirit, the adventurous, strong spirit of the Protestant pioneers of the Midwest.” But when the Lynds found that dramatic changes in traditional American values had already transformed Muncie, the institute distanced itself from the publication of *Middletown*.

The Lynds found varying institutional adaptations to the modernizing forces at work in *Middletown*. They claimed that the highest degree of change had occurred in earning a living and leisure-time activities. Both changes were attributed to technological innovations. In the case of work, the rise of the industrial system created two major groups, the working and business classes. Meanwhile, greater organization of leisure time resulted from such technological developments as the automobile and moving pictures. While the informal contact of the past had encouraged the development of close-knit ties between people in the midwestern city, the technological changes in leisure-time activities were creating a highly mobile and organized group life that left residents more isolated in *Middletown*.

The Lynds found that consumer values had begun to replace the older Puritan values of frugality, austerity, and civic-mindedness. They believed that community members in Muncie, no longer each other’s moral keepers, still retained a strong belief in competitive individualism. In addition, the community was characterized by a class system, divided between the “business class” and the “working class.” The Lynds’ examination of how competitive individualism replaced the older values of white, Anglo-Saxon, Protestant culture was a significant contribution that influenced a whole generation of sociologists.

By focusing on traditional American values, the Lynds ignored important trends that were part of Muncie’s development. For example, southern “hillbillies” and African Americans were absent from the study, even though both groups already had become significant minorities in Muncie by the 1920s. In addition, critics have pointed out that Muncie’s dominant industrial family, the Ball brothers, were missing from the study as well. Evidently, the Lynds viewed such a dominant family as the norm and not of any special importance worthy of study. Even though their analysis of the class system was innovative, their examination of the decline of Protestant values obscured some of the demographic and cultural subtleties that transformed Muncie. In 1937, the Lynds returned to Muncie to see how the city had changed during the Great Depression. In *Middletown in Transition*, they concluded that not much had changed.

Finding the values of the citizens of Muncie relatively unaffected by the economic crisis, the Lynds wrote, “The texture of Middletown’s culture has not changed . . . Middletown is overwhelmingly living by the values by which it lived in 1925.”

## migration

The migration of people from one place to another, whether internally or internationally, was a significant force in the United States during the early 20th century. In the years prior to WORLD WAR I, IMMIGRATION to the United States reached its peak, with 6 million immigrants arriving between 1900 and 1910 and nearly a million annually between 1900 and 1920. The “new immigration,” as it was called, came primarily from southern and eastern Europe and brought new customs and religious practices to the United States. Moreover, the new immigrants significantly increased the labor force, filling jobs in mass production and extractive industries. Their large numbers also contributed to the intensity and visibility of anti-immigrant sentiment among native-born Americans and gave rise to demands for the restriction of immigration.

The industrial development that attracted waves of men and women from Europe prompted others to migrate within the United States. Many men and women left the countryside and moved to cities, seeking better economic and cultural opportunities. Rural-to-urban migration was not new in American history, but the process accelerated during the late 19th and early 20th centuries. While only 28.6 percent of Americans lived in an urban area in 1880, 40 percent did in 1900. The 1920 census reported that the United States had become an urban nation as more than half of its citizens (51.4 percent) lived in areas with a population of 2,500 or more.

Rural-to-urban migration was particularly common among young farm men and women. During the 1920s, a decade in which nearly 6.25 million people moved from the country to cities, one out of every four rural individuals in their early twenties left the countryside. A number of factors prompted their migration, including declining farm prices as the economy normalized after World War I, increasing employment opportunities in the cities, and the desire to seek independence and excitement away from home. Young women were even more likely to migrate to

an urban area than young men, since there were fewer job opportunities for them in rural areas. This migration of the young had lasting effects on the rural population. The age of the average farm operator increased, with 52.6 percent being over the age of 45 in 1930, while only 48.1 percent had been in 1920. The aging rural population also meant that there were fewer young people to attend churches and schools or shop and work in small towns.

People in the United States also migrated from one region of the country to another at this time. The largest such shift was the migration of people, both black and white, out of the primarily agricultural South to areas in the northern or western states. Starting in the years before World War I, African Americans left the South in the GREAT MIGRATION, hoping to find better economic opportunities as well as freedom from the restrictive Jim Crow laws of the South. Many of these individuals found work in factories or domestic service, jobs to which they were largely confined by racial prejudices. The migration of African Americans out of the South steadily increased during the early 20th century, with approximately 200,000 leaving the region in the first decade. Approximately 437,000 African Americans left the South during the 1910s and more than 800,000 during the 1920s. These migrants not only changed the racial composition of northern cities but also created institutions that would later provide some of the framework and leadership for the northern segment of the Civil Rights movement.

White southerners left the South to avoid the same agricultural economic hardships that many African Americans also faced. White southerners, however, did not encounter racial discrimination in the North. Their race made it easier for them to obtain higher paying, higher status work. More than 700,000 white southerners migrated north and west during the first decade of the century, 893,000 during the 1910s, and almost 1.5 million during the 1920s. Both white and black migration influenced American culture, spread Baptist and Pentecostal RELIGION out of the South, and contributed to the development of blues, jazz, and country MUSIC across the country.

The outbreak of World War I accelerated both rural to urban migration and South-to-North migration, as more workers were needed in northern industries to produce the supplies needed for war. The turmoil of World War I cut the United States from its source of immigrant labor in Europe, meaning that few new workers arrived in the United States. This shortage of immigrants proved beneficial to internal migrants, particularly African Americans, as many of them were able to obtain higher paying industrial jobs for the first time during the war.

Immigration never attained its former levels due to legislation passed in the 1920s, which made immigration from Asia, Africa, and southeastern Europe difficult or impossible, due to restrictive quotas. As a result, the num-

ber of immigrants arriving each year fell off sharply. The primary source of immigrants became Canada and Mexico, since Western Hemisphere nations were not included in the restrictive quotas. Migration within the United States continued unabated during the 1920s, although the economic collapse during the Great Depression caused a temporary decline in labor migration.

## mining industry

The mining industry involves the excavation, extraction, and refining of minerals and ores from below ground, including coal, copper, iron, silver, gold, and materials such as asbestos. The mining of minerals and ores has been a significant factor in America's economic growth, particularly in the early 20th century. It continues to play a major role in supplying fuel and raw materials for industry and energy for consumers.

The coal industry was by far the most prominent sector of the mining industry. It consisted of two distinct ores—bituminous coal and anthracite coal. Anthracite, a hard-rock coal, was confined to a small region in Pennsylvania, while softer bituminous coal was present in the Appalachian mountain region and expansive parts of the Midwest and South. Miners first excavated bituminous coal in Virginia in 1750; the exact date of the discovery of anthracite coal is unclear. A blacksmith found that anthracite coal, although more difficult to ignite, was cleaner, burned more slowly, and generated more heat than bituminous coal. By the early years of the 19th century, anthracite was widely used to heat homes.

Anthracite coal also played a major role in iron production. Iron forgers had been unable to smelt cheap iron using bituminous coal as it contained too much sulfur, both for the smelting process and for conversion into coke. Instead, they produced small quantities of high-quality iron using charcoal. From the mid-19th century, however, anthracite coal facilitated the production of cheap low-grade iron. In the years after the Civil War, as a result of rapid industrialization and significant urban growth, demand for bituminous coal soared. It found favor over anthracite coal

because it was cheaper and burned more quickly. In 1900, the nation's soft-coal fields produced 212,316,112 tons of coal and provided more than half of its energy. In contrast, the anthracite mines produced 57,363,396 tons of coal and generated just over 14 percent of America's energy.

In 1900, there were 143,824 miners working in the anthracite region, while 204,757 miners worked in the bituminous coal fields. A small number of powerful railroad companies controlled the anthracite fields. Through a series of mergers, these companies had been able to establish control over prices and edge out small independent operators from the market. The most powerful company was the Philadelphia and Reading Company, a railroad network that carried two-thirds of the state's coal supply. The growing power of the railroad companies, combined with their refusal to meet miners' demands, caused labor unrest in the region.

The ANTHRACITE COAL STRIKE of 1902 was one of America's largest industrial strikes and resulted from min-

ers' dissatisfaction with the outcome of an earlier strike. While the coal operators had agreed to pay higher wages to end that strike, they had not offered formal recognition to the UNITED MINE WORKERS OF AMERICA, the largest mining union in the United States. A number of miners had responded by holding a series of unofficial strikes in the summer of 1901. By early 1902, operators were threatening to abolish the new wage increase.

JOHN MITCHELL, the president of the UMWA, met with railroad executives in April 1902, but he was unable to persuade them to accede to the miners' demands. The miners sought the renewal of the wage agreement, recognition of the union, and the implementation of the eight-hour workday. Against the wishes of Mitchell, union delegates voted in mid-May to go on strike. There were periodic episodes of violence in the strike that followed, including one incident where union members beat to death someone escorting strikebreakers. The incident prompted the intervention of President THEODORE ROOSEVELT. On

The Treadwell gold mine at 500 feet beneath the ocean, 1916 (*Library of Congress*)

October 3, 1902, he chaired a meeting between railroad executives, headed by Philadelphia and Reading chairman George Baer, and union representatives, led by Mitchell. The failure of the two sides to reach an agreement meant that Roosevelt had to search for an alternative way of ending the strike. Eight days later, Elihu Root, the secretary of war, met financier JOHN PIERPONT MORGAN, one of the mining industry's largest investors, in New York City. Morgan agreed to pressure the operators to reach a settlement with the miners. The operators responded to Morgan's pleas by calling on the president to establish a strike commission. Mitchell agreed to the idea of a strike commission, but he believed the mine union needed to be represented.

The commission that Roosevelt subsequently created, the Anthracite Coal Strike Commission, consisted of seven members, including representatives from the coal industry and the union. Its purpose was to assess the conflicting claims of each party and establish a settlement through binding arbitration. On October 23, UMW representatives instructed the miners to return to work, bringing an end to the strike after 165 days. The commission began its lengthy investigation and publicly announced its settlement the following year. Most significantly, it increased wages by 10 percent and reduced the working day from 10 hours to nine. While it ruled against union recognition and collective bargaining, the ruling stipulated that mine operators had to recognize a six-man arbitration board to mediate future disputes. Mitchell and his colleagues regarded the settlement as a victory for the union.

In contrast to the anthracite sector, the bituminous sector consisted of many small-to-medium-size companies. The more competitive nature of that sector, combined with the much wider geographical spread of bituminous coal, hindered miners' ability to form a strong nationwide labor movement. Miners in southern Colorado participated in a major strike for 14 months from 1913 to 1914, establishing tent colonies in a number of mining towns, but they were ultimately unsuccessful in achieving their demands. The strike also gained notoriety for the infamous LUDLOW MASSACRE, which took place on April 20, 1914.

As WORLD WAR I began in Europe, American production of bituminous coal continued to increase, while anthracite production fluctuated. In 1917, the year the United States entered the war, bituminous production exceeded half a billion tons for the first time, reaching a total of 551,790,563 tons. The Pennsylvania mines produced 100,445,299 tons of coal, a marked increase from the 1910 figure of 84,485,236 tons. After the war, the anthracite sector went into permanent decline. Total production in 1920 was 89,636,036 tons, and 10 years later that amount had fallen to 68,776,559 tons. A number of factors accounted for this decline, including industry's increasing reliance on bituminous coal, the introduction of electricity

to the nation's homes, lack of government intervention, and the failures of the mine owners to operate in a cost-effective manner.

The employment rate among mines dropped in both anthracite and bituminous mining, although the industry's decline in the 1920s was not the only factor that caused job losses. Increasingly, companies were mechanizing their mining operations and installing modern equipment to do the work traditionally carried out by miners, such as the loading of coal onto carts. In 1923, there were 704,793 miners employed in the bituminous sector, and by 1930 this number had dropped to 493,202.

The coal industry posed a number of hazards, both to the miners who toiled in the underground mines and to the environment. A series of fatal mine disasters in the early years of the century, including an explosion at the Monongah coal mine in West Virginia that killed 362 miners, and an increase in the number of miners with debilitating lung diseases such as pneumoconiosis emphasized the dangerous nature of mine work and brought the issue of OCCUPATIONAL HEALTH AND SAFETY to the forefront of the industry. Mine owners frequently tried to evade responsibility for improving health and safety, and the federal government's efforts to regulate the industry—for example, by creating the Bureau of Mines, an Interior Department agency that was responsible for making safety recommendations—were limited. Coal-burning factories in major cities across the Northeast and the Midwest, such as New York, Philadelphia, and Chicago, damaged the environment and jeopardized the health of local residents. A heavy smog that reduced visibility and affected people's breathing frequently lingered in the air of those cities, and buildings gradually turned black from the soot that poured from chimneys and smokestacks.

Copper was not as important as coal to America's economic and industrial development, but it was still a vital sector of the mining industry. It was used in the construction of buildings, underground pipes, machinery and—particularly during World War I—munitions and weapons. The discovery of copper, which was prevalent in the Lake Superior region, Montana, and Arizona, predated that of coal. A French author named Lagarde published a book in Paris in 1636 that referred to the existence of copper in the Lake Superior region, and Jesuit missionaries in that region referred to the Indians' use of copper in the letters they sent home in the mid-17th century.

Copper mining began on a large scale in the Lake Superior region in 1864, after a land surveyor by the name of Edwin J. Hulbert discovered a copper supply that became known as the Calumet Conglomerate Lode. He distributed half of it to the Calumet Mining Company and the rest of it to the Hecla Mining Company. Hulbert spent a brief but unsuccessful period as superintendent of

the Calumet mine before he sold his shares to Quincy A. Shaw, one of the company's key investors. Shaw appointed his brother, Alexander Agassiz, to the position of superintendent. Under Agassiz's guidance, the mine quickly began to turn a profit. The two companies merged in March 1871 to form the Calumet and Hecla Mining Company, which quickly became the dominant force in the region's copper industry.

The Lake Superior copper mines increased their output almost threefold between 1890 and 1916, from 51,000 tons to 135,000 tons. Aside from Calumet and Hecla, only a handful of major companies, including the Quincy Mining Company, contributed to that growth. The Calumet and Hecla Mining Company further expanded in 1923 when it merged with the Osceola Consolidated Mining Company, the Allouez Mining Company, the Centennial Copper Company, and the Ahmeek Mining Company to form the Calumet and Hecla Consolidated Copper Company.

The copper industry in the Lake Superior region experienced its share of labor unrest. The WESTERN FEDERATION OF MINERS (WFM), founded in Montana in 1893, was the most dominant union in the copper fields. For a number of years, however, it failed to capitalize on miners' discontent, and most strikes were of a localized nature. The WFM established a significant membership in Michigan after it started to employ immigrant organizers in 1913, a measure that enabled it to appeal to the diverse array of ethnic groups working in the state's copper mines. In July of that year, miners in the state's Upper Peninsula embarked on a major strike that lasted until April the following year. The strike was unsuccessful in achieving the miners' demands, which included the eight-hour working day and replacement of the one-man drill with the two-man drill.

Western states, particularly Montana, which produced 42 percent of the country's copper in 1900, played a significant role in the growth of the copper industry. As in the Lake Superior region, a few large companies dominated copper production in the West. In Montana, the Anaconda Mining Company was the most prominent. It grew from its beginning as a small company engaged in silver mining to one of America's largest corporations. In 1900, it produced 55,400 tons of copper, 13,800 tons more than its nearest competitor. It expanded its operations to Latin America in 1916 when it created the Andes Copper Mining Company at Potrerillos in Chile to capitalize on the vast copper reserves in the Andes mine. Anaconda waited some years before it commenced production on a large scale, as copper prices plummeted immediately after World War I; but by 1929 it had transformed the Andes mine into one of the largest and most profitable mining operations in the world.

As a whole, the U.S. copper industry grew steadily during the Progressive Era. It produced 30,200 tons of

copper in 1900 and 955,000 tons in 1918. Despite the increase in production, the U.S. share of global production remained largely unchanged, increasing from 56 percent to 61 percent during the same period. The reduced demand for copper after World War I, combined with a slump in global copper prices, caused production to drop in 1920 to 612,000 tons. The early 1920s marked the beginning of the copper mining industry's decline in the United States, despite the fact that burgeoning industries such as radio, electricity, and communication utilized the metal for the construction of wires, masts, and other devices.

In the early 20th century, the U.S. mining industry also extended to metals, such as iron ore, silver, and gold, and fibers, such as asbestos. Iron, derived from iron ore, played an important role in the development of the nation's transportation network, at first directly and then as an ingredient of steel, a far more durable metal. It was a key component of steam locomotives, railroads, ships, and early models of the automobile. Gold was at the center of the American monetary system, but it was no longer the focus of large-scale mining efforts, as it had been in California in the 19th century.

The mining industry was crucial to the United States's economic and industrial development in the Progressive Era, but significant labor unrest and the visible impact of mining on people's health and the environment demonstrated that the industry exacted costs that almost neutralized its benefits.

### **Mitchell, John** (1870–1919) *labor leader*

John Mitchell was one of the first presidents of the UNITED MINE WORKERS OF AMERICA (UMWA) and helped establish the organization as one of the most effective and progressive unions in the country. Born in Braidwood, Illinois, on February 4, 1870, Mitchell was orphaned at the age of six. He attended school only irregularly and began working

in the mines at the age of 12. When not toiling underground, Mitchell spent his time reading and taught himself history, economics, and the law. In 1885, at the age of 15, he joined the Knights of Labor. Frustrated by the decline of the Knights and its inability to conduct successful strikes, Mitchell joined the UMWA shortly after the union was formed in 1890. Between 1890 and 1900, the union had considerable success at organizing the nation's bituminous miners. As the union grew, Mitchell moved up the ranks, becoming vice president in 1898 and president in 1899.

For a variety of reasons, the UMWA had not been able to organize anthracite miners. Anthracite mines had a greater variety of job categories, operated on a larger scale, and had greater ethnic diversity among their workers. The union had, without success, tried to organize anthracite miners on several occasions. In 1897, the UMWA initiated another organizing effort and quickly had widespread success. Employer opposition, however, remained intense and the organizing drive came to a head in 1902. In April and May of 1902, Mitchell met with mine operators and railroad executives in an attempt to avoid an industry-wide walkout. When the companies refused to grant any concessions, the miners voted 57 percent to 43 percent to go out on strike. The ANTHRACITE COAL STRIKE idled over 140,000 miners and lasted five months. As the strike lingered on and the nation's supply of coal dwindled, President THEODORE ROOSEVELT intervened and appointed an Anthracite Coal Strike Committee to resolve the differences between the workers and the mine operators.

Roosevelt, who was attempting to establish a reputation as a critic of business monopolies, and Senator Mark Hanna of Ohio who sought organized labor's support of the REPUBLICAN PARTY, saw the 1902 strike as an opportunity to rebuke coal and railroad operators. Roosevelt ordered striking workers back into the mines while the Anthracite Coal Strike Committee gathered information about the dispute. After five months of deliberation, it called for a 10 percent pay increase and a reduction in the workday from 10 hours to nine. The successful conclusion of the strike made Mitchell a national hero for many workers.

The strike and negotiations, however, had left Mitchell exhausted. He had a nervous breakdown in 1906 and resigned as head of the UMWA in 1908. Mitchell remained active in the labor movement, serving on commissions and giving public lectures, until his death from pneumonia in 1919. As head of the UMWA, Mitchell navigated a path between the more conservative AMERICAN FEDERATION OF LABOR and the more radical INDUSTRIAL WORKERS OF THE WORLD (IWW). He was not hesitant to resort to strikes and direct confrontations when employers proved reluctant to negotiate. Yet, he also cooperated with business and political leaders in such joint efforts as the NATIONAL CIVIC FEDERATION in order to settle disputes. As a result,

Mitchell was able to build the UMWA into one of the strongest unions in the country.

**Mitchell, William (Billy)** (1879–1936) *general and airpower advocate*

If, in the annals of American military history, men such as John Ericsson and George Patton are viewed as visionaries, then the name of Billy Mitchell should be a part of that class. His visionary adroitness and crusader zeal made possible not only the creation of the U.S. Air Force but also set the strategic underpinnings of airpower's role in future wars. Billy Mitchell, son of a future U.S. senator from Wisconsin, was born in Nice, France, in 1879. Raised in Milwaukee, Wisconsin, he was educated at both Racine College and George Washington University. Upon the outbreak of the Spanish-American War, Mitchell enlisted in the U.S. Army as a private in 1898. Within six weeks, he received a commission as a Signal Corps officer. In addition to service in Cuba, he saw action during the Philippine insurrection and the Mexican expedition against Pancho Villa.

As early as 1906, Mitchell prophesied that "conflicts, no doubt, will be carried out in the future in the air." After the army purchased its first aircraft, he wrote several articles stressing the importance of aircraft in war. He argued that airplanes would be useful for reconnaissance, for preventing enemy forces from conducting reconnaissance, and for offensive action against enemy submarines and ships. Due to the advances being made in aeronautical technology, Mitchell argued, the United States was being drawn ever closer to its enemies, and that distance would soon be measured in time not miles. These facts underlined the importance of developing air power. He was assigned to the Army General Staff in Washington in 1912 as a captain.

After being promoted to major, Mitchell was too high ranking and too old for flight training. Firmly believing that the future lay in aviation, however, he paid for his own flight training at a civilian flight school. When the United States entered WORLD WAR I, Mitchell quickly rose to the rank of colonel. He was appointed to General JOHN PERSHING's staff as an aviation officer. His actions in France culminated with his command of a 1,481-plane air attack, the largest of the war, during the St. Mihiel offensive of September 1918. In 1919, Mitchell returned to the United States a much-decorated officer and was appointed assistant chief

of the U.S. Army Air Service. By 1920, he was promoted to the rank of brigadier general.

The postwar years, however, saw the parochial interests of army generals and navy admirals supersede Mitchell's dream of a prepared and well-equipped Air Service. In June and July 1921, Mitchell took on the Department of the Navy and demonstrated his theory of air power by sinking several battleships, including the German battleship *Ostfriesland*, off the Virginia coast. Never at a loss for words, Mitchell pronounced that "no surface vessels can exist wherever air forces acting from land bases are able to attack them." This and other declarations concerning the preeminence of air power earned him the undying enmity of generals and admirals alike.

In 1924 Mitchell continued his crusade by attacking his superiors and the foes of airpower in both print and speech. It is little wonder that he was not reappointed to the Air Service when his term expired in 1925. Reduced to the rank of colonel and exiled to Fort Sam Houston in Texas, it was hoped that the last had been heard about and from Billy Mitchell.

Fortunately for his country and unfortunately for Mitchell, this was not to be the case. In September, two aviation accidents occurred. The first was the loss of a naval seaplane on a nonstop flight from San Francisco to Hawaii. The second was the crash of the dirigible *Shenandoah*. Mitchell's acerbic pen struck a scathing attack upon both the U.S. Navy and the War Department, accusing them of incompetence and criminal negligence.

Secretary of War Dwight F. Davis was outraged at Mitchell's attack. A court-martial board was convened in Washington on October 28, 1925. After seven weeks, the board found Mitchell guilty of the charge of insubordination. Mitchell resigned from the army on February 1, 1926. After many tireless years of sounding the alarm from the wilderness, Mitchell died in New York on February 19, 1936, at the age of 56. He was laid to rest in Milwaukee. The events of World War II vindicated Mitchell's vision and even though his conviction was never overturned, he did receive a special Congressional Medal of Honor "in recognition of his outstanding pioneer service and foresight in the field of American military aviation."

## modernism

Modernism was an intellectual and cultural movement that began at the turn of the 20th century and lasted until the

end of World War II. As a term, modernism was first used in Germany during the 1890s and spread across Europe. The continued strain of technological innovation, the introduction of SIGMUND FREUD's theories of the unconscious, dream interpretation, and free association, and the growing sense of individual fragility in the face of modern society fueled a cultural rebellion against genteel culture and its rigid moral code and also against convention and tradition. Nonrepresentational or abstract art, free verse, and indirect imagist techniques in poetry and novels were central to this new artistic vision.

In the field of visual art, painters began to explore form and substance, rather than concentrate on fine-tuning realist techniques that were better reproduced with photography. Prevalent artistic movements within modernism included Art Nouveau, fauvism, and expressionist, futurist, cubist, dadaist, and abstract ART. In each case, there was a movement away from representation to using indirect and abstract forms. In the United States, modernism gained its first national notice with the experimental ARMORY SHOW of 1913, which brought to American artists the work of European impressionists and expressionists.

The movement toward modernist poetry had one of its chief centers in Chicago with Harriet Monroe's *Poetry: A Magazine of Verse*, first published in 1912, and Margaret Anderson's *The Little Review*, which began publication in 1914. Anderson drew on the modernist circle that formed in GREENWICH VILLAGE and included writers and social critics such as Max Eastman, Mary Heaton Vorse, Hutchins Hapgood, JOHN REED, and Eugene O'Neill. Monroe turned *Poetry* into the first imagist showcase when she wrote to Ezra Pound to persuade him to recruit his circle of poets to publish in the journal. Other modernist poets such as Thomas Stearns Eliot, H. D. (Hilda Doolittle), Gertrude Stein, E. E. Cummings, and William Carlos Williams contributed to the growing acceptance of free verse and indirect representation of feeling through images associated with modernism.

The modernist impulse similarly influenced historical LITERATURE and the genre of the novel, particularly in the years after WORLD WAR I. While historians Charles and Mary Beard and Carl Becker reworked historical narrative and questioned historical objectivity, novelists such as John Dos Passos experimented with introducing multiple narrative lines and collagelike prose. Most importantly, the ideals of honesty and rebellion against convention brought new, diverse voices into art and literature. Among the artistic movements in the United States associated with modernism was the HARLEM RENAISSANCE that brought African-American traditions and racial experience to the forefront of American culture.

### Mooney-Billings case

Heightened class conflict in the Progressive Era sometimes involved the direct intervention of the government. In the Mooney-Billings case, political protests against military preparedness led to the conviction of two labor leaders for murder. The case became a celebrated cause for labor and radical reformers. On July 22, 1916, a bomb went off at a Preparedness Day parade in San Francisco, California. The Pacific Coast Defense League had sponsored the parade, following a successful one in New York City, to strengthen public support for military armament during WORLD WAR I. Local newspapers estimated that the parade in San Francisco had more than 50,000 participants. Ten people were killed and 40 seriously injured in the bombing. The police responded inconsistently. It was not until two and a half hours later that police roped off the scene, and authorities did not supervise the collection of evidence. Consequently, souvenir hunters combed the site, destroying relevant evidence along the way. As a result, the police department later had to publish a request for the return of evidence found at the scene to authorities.

In a climate of wartime hysteria, city leaders and newspaper editors accused PREPAREDNESS opponents and anarchists of the bombing. With irresponsible JOURNALISM feeding public outcry, five local radicals were arrested and indicted for murder. Out of the four that were tried, two were convicted. The men who were convicted, Warren Billings and Tom Mooney, were left-wing activists who had participated in local labor struggles over the years. Billings received a sentence of life imprisonment, Mooney death by hanging.

Evidence soon emerged that perjury had been committed and that the prosecution had withheld evidence. After his conviction, Mooney became internationally famous as a martyr for radicals, organized labor, and defenders of civil rights. Representing over 50 labor and radical organizations in San Francisco, the International Workers Defense League, of which Mooney was an active member, petitioned and lobbied for the pardon of Mooney and Billings. They also sent organizers around the country to raise funds and awareness for the legal defense of the two men. Some people, however, saw the two men as a radical threat to patriotism and law and order during World War I. In March 1918, the California Supreme Court upheld Mooney's conviction. Two weeks before Mooney was scheduled to hang, Governor William D. Stephens commuted his sentence to

life imprisonment. Stephens said that President WOODROW WILSON had made repeated requests for him to do so and that new evidence had emerged in the case, though the governor failed to mention what the evidence was.

Radicals and organized labor supported Mooney's cause for another two decades. In 1939 Governor Culbert L. Olson declared that he believed Mooney was innocent and pardoned him, stating that the conviction had been based on perjured testimony. Billings, however, remained in prison for 10 more months after Mooney's pardon. Olson could not pardon Billings without the approval of the unsympathetic state supreme court in California. When the court repeatedly voted against pardoning Billings, Olson commuted his sentence to time served. In a ceremony the day after Billings was released, Olson apologized for not being able to pardon him, noting that he thought that Billings was innocent. In 1961, 45 years later, Governor Edmund G. Brown gave Billings a complete pardon after he received the approval of the state supreme court.

### mothers' pensions

Mothers' pensions were state-level relief benefits designed to support the children of widowed mothers. The forerunner of the Aid to Dependent Children program developed under the New Deal, mothers' pensions provided small cash grants to supplement the income of impoverished widows who supported themselves through wage-earning but needed additional funds. Advocates of mothers' pensions believed that the income supplement would encourage women to keep their children at home, rather than send them to orphanages. They also argued that the pensions would persuade widowed women to take jobs or engage in home work that allowed them to spend the maximum amount of time at home.

An early attempt to pass a statute for the support of widowed women took place in New York in 1897. The state legislature nearly passed a Destitute Mothers' bill, which would have given deserted women a right to public relief. The timing, however, was wrong. Social work advocates were only just beginning to shake off the legacy of scientific charity, and opponents of the bill could count on public opposition when they nicknamed the measure "the Shiftless Father's Act." By 1910, the political climate had changed.

Mothers' pensions can be seen as part of the larger campaign of "child saving" in the Progressive Era. Linked to other reforms in education, the playground movement, child labor laws, and juvenile justice, the mothers' pension program sought to provide the best care for poor and working-class children. The same ideal of scientific motherhood that inspired the reformers of the CHILDREN'S BUREAU shaped the mothers' pension program. Financial support of women's role within the family, it was hoped, would give incentives to mothers to provide better parental care and supervision.

Juvenile court judges were among the first advocates of mother's allowances. Judge E. E. Porterfield of Kansas City lobbied the Missouri legislature to pass a measure giving mothers' aid to women in Jackson County. Illinois created the first statewide program for mothers' pensions in early 1911. Supported by divergent groups such as the National Congress of Mothers, the General Federation of Women's Clubs, and settlement house workers, the push for mothers' aid spread quickly through northern, mid-western, and western states. Within two years, 20 states had passed mothers' aid laws. By the 1920s, 40 states and hundreds of counties in the United States had mothers' pensions programs.

Despite the best intentions of its advocates, the mothers' pensions system failed to live up to its purpose of alleviating the plight of poor children and protecting motherhood. Most states and counties did not have the funds or the political support to expand the mothers' pension program beyond its modest beginnings and could not raise enough public monies to fund the system. States failed to fund existing mothers' pensions adequately, due to popular resistance to new property taxes and the absence of any alternatives. Further, many localities refused to develop new agencies and programs for widows. Even in terms of its original modest aims, the mothers' pension movement had severe drawbacks. Limited in its coverage, it did not fund women who were either deserted or divorced, and its provisions barred unwed mothers from eligibility.

Framed in the language of sacred motherhood, the mothers' pension effort dictated that its recipients be the moral and deserving poor. Those who received pensions were under moral scrutiny both when they applied and while they received the pension. At the same time, the program demonstrated racial and ethnic exclusivity, especially in the South. Most early recipients of the mothers' pensions were white, native-born women. Finally, as a state-level program, mothers' pensions never became the deserved "pension" for mothers that its most radical advocates desired. Mothers' pensions were tied to the number and age of children. No support was provided for the widow herself, and the stigma of poor relief, with its moral supervision and public disdain, remained.

In the 1930s, the collapse of local relief agencies and the lack of funding, combined with the new policy initiatives, provided the impetus for the development of a federally funded program in 1935 called Aid to Dependent Children. This program also suffered from the failures and limitations of its parent program. State-level administration, miserly grants, chronic lack of funds, moral supervision, and the stigma of relief continued to hobble efforts to provide single mothers, whether divorced, deserted, or widowed, with decent income support in hard times.

## movie industry

The emergence of the motion picture industry was one of the most important social, cultural, and economic developments of the early 20th century. It helped to define and mold social values and norms. It assisted in the homogenization of American culture, and it provided accessible and affordable entertainment to the general public. In contrast with European film, which was viewed as an elite art form, movies in America were geared toward a mass audience.

When movies first emerged as a form of entertainment, they were hampered by limitations in technology. The most significant limitation was the inability to successfully integrate sound into moving pictures. It had a democratizing effect on the population. Language barriers, which often hampered immigrants' ability to fully enjoy English-language theater, were not a factor for silent films. Immigrants unable to speak or understand English were able to enjoy the comedy of Charlie Chaplin and the tragic genius of Rudolph Valentino and Greta Garbo.

Movies did not emerge overnight. The movie camera was developed in the late 19th century. Thomas Edison Laboratories created the first successful camera in 1889. Five years later, Edison's technicians perfected the Kinetoscope, a large wooden box with a peephole at the top through which customers could view the pictures. Edison, however, did not take adequate steps in protecting his invention. He filed only for American patents. As a result, his two assistants, W. K. Laurie Dickson and Eugene Lauste, broke away and patented their own inventions. They formed the American Mutoscope and Biograph Company, backed by a number of influential Americans. The most notable of their backers was Ohio governor and future president, William McKinley.

The development of the motion picture marked much more than a technological innovation. It signaled the beginning of an industry that would redefine American art and culture. The industry began slowly. At first, it was seen only as a source of amazement. To address the public fascination with the technology, movie producers focused on the appeal of the technology; the development and production of stories was a mere afterthought. Early novelty films were little more than still pictures put into motion.

As the technology improved, so too did the scope of films. Edwin Stratton Porter (1870–1941), who began his career in 1896, was instrumental in the development of the motion picture from novelty to art form. Porter was a Scotsman who settled in America with no theatrical experience. He eventually became the master of the edit. Through the editing process, he was able to modify films and in the process distort perceptions of reality. In late 1902 or early 1903, he created *Life of an American Fireman*. It was his first real motion picture. Later in 1903, he realized his sophomore work, *The Great Train Robbery*, the first of a long line of classic Western movies.

D. W. GRIFFITH further developed the idea of a motion picture not only telling stories but also defining reality. He was introduced to film in Porter's *Rescued from an Eagle's Nest* in 1907. He played the father hero. Even then, Griffith did not see himself as an actor. In fact, in order to save his name for greater endeavors, he went by the alias Lawrence Griffith. Griffith envisioned himself as a great theatrical producer, but success in the theater eluded him. His first and last theatrical production was a flop. In 1908 he directed his first film, *The Adventures of Dollie*. Less than a decade later, in 1915, he released the most ambitious movie of his time, *BIRTH OF A NATION*.

Unlike many films released in Europe, movies made in the United States were extremely short. *Birth of a Nation* challenged this idea. It was among the first full-length American feature films. It also changed the rules of how movies would be shot. Griffith moved the camera up close, which allowed for the development of intimacy between camera and audience. He integrated these with medium and distance shots. From this point on, movies became a way to convey thought and emotion. Innovation of filming techniques, however, was not the most notable accomplishment of the movie. One of the most noteworthy results of the movie was the response it provoked from different people. While large segments of society boasted of its sheer greatness, others protested its message. The release of *Birth of a Nation* made it clear that movies could and would influence the way people viewed certain events. The movie portrayed the Reconstruction era of American history in such a way that large segments of society, especially blacks, found it offensive. It degraded African Americans, insulted northerners, and idealized the KU KLUX KLAN.

Charlie Chaplin in *A Dog's Life*, with Edna Purviance (Library of Congress)

The political possibilities of movies were evident even before the release of *Birth of a Nation*. One of the first Edison films to be shown in April of 1896 was *The Monroe Doctrine and Cuba Libre*. It was the first overtly political film. Politics, however, was only one of the many topics that films embraced. Another, as exemplified in *Birth of a Nation*, was history. The most recognizable of the history films were the stories of the American West. In the 1920s, epic Westerns became the films of choice. Like *Birth of a Nation*, these films were developed upon a loose interpretation of American history. Savage Indians forced the brave and heroic settler to fend off attacks. The *Covered Wagon* (1923) was just one of the many movies of the era that championed this perception of American history and cinema.

Alongside the development of dramatic pictures came comedies. Mack Sennett (1884–1960) released his version of an epic western, *The Uncovered Wagon*, which, like his other films, displayed the comic side of life. Sennett was a former coworker of Griffith's. He took the comic film to new level through the development of slapstick comedy. Sennett's Keystone Kops came to represent this new form of entertainment. He understood that slapstick comedy was as natural for the movie industry as action and melodrama, because all three topics unutilized motion and timing.

The greatest comic actor of the era was Charlie Chaplin. Chaplin was born in England in 1889. He toured the United States with his family in 1910 and returned in 1912. The following year, he joined Sennett's comedy team. Chaplin's early shows were one- and two-reelers such as *The Pawnshop* (1916) and *Easy Street* (1917). He later starred in a number of medium-length films, such as *Shoulder Arms* (1918) and *The Kid* (1921). His major films were *The Gold Rush* (1925) and *City Lights* (1931). Chaplin's career lasted more than three decades. He entered the industry only a few years after Griffith, but he was still producing and directing films 30 years after Griffith's last major production.

During the first decades of the 20th century, the center of the movie industry moved from the East Coast to the West Coast. In 1910, D. W. Griffith and Cecil B. De Mille (1881–1959) helped to transplant filmmaking to California, where the land was cheap and the climate and scenery ideal for developing motion pictures. The fact that Los Angeles had a reputation as a staunch antiunion town further heightened its appeal.

WORLD WAR I proved to be a true catalyst to the development of the American movie industry. The United States was the only leading film-producing country (except for Italy) that did not enter the war in 1914. When the United States finally did enter the war, its participation was on a smaller scale than that of other nations. The American film industry never experienced the restrictions or lack of supplies that the filmmakers in European nations experienced. Not even European movie stars like Max Linder were excused from the war effort. The war devastated the European film industry and provided a vacuum that American film producers could fill. As a result, the United States was producing 90 percent of the world's movies by war's end.

When movies first emerged, they were targeted to the widest audience possible. John P. Harris and Harry Davis opened the first nickelodeon in Pittsburgh in 1905. Patrons could view a movie for five cents. It was well within the means of typical working-class people. As a result, the industry spread rapidly. Less than 12 months after the first nickelodeon appeared in Pittsburgh, there were more than 100 such enterprises in that city alone. By 1908 the number of nickelodeons in the United States had reached an astounding 10,000.

The movie industry did not remain fully faithful to its working-class origins. The discretionary income of the middle class made them a coveted target. As a result, movies became big business. The emergence of major movie studios allowed for full development of the industry. Large studios such as Metro-Goldwyn-Mayer made movies of increasing cost and complexity. With the added cost, only the biggest producers could take on such tasks. Actors, too,

began to charge more for their work. It was clear that movies were indeed big business.

In the late 1920s, the major studios converted their production facilities from silent movies to talkies. These new movies had substantial commercial success. *The Jazz Singer*, produced by Warner Brothers, was the first feature-length movie to incorporate talking and sound and music effects. *The Jazz Singer*, starring Al Jolson, redefined the industry. In order to survive, movie industry moguls had to produce films with sound. It made the industry even more capital intensive, but it did not slow the growth of the industry. By the end of the 1920s, the nation had more than 22,000 movie theaters, and movie attendance rose to 90 million by 1930. Movies became the chief form of entertainment for the mass audience.

## muckrakers

*Muckraker* was the name given to investigative journalists in the Progressive Era. They were responding to concerns about the urban crisis, excessive corporate power, and political corruption. Following in the footsteps of reform journalists of an earlier day, they sought to make the truth about poverty, vice, and injustice known. Once the public was informed, they would demand that government address the problems of influence-peddling, monopoly practices, and employer negligence. Progressive and left-wing organizations such as the INDUSTRIAL WORKERS OF THE WORLD (IWW), the Socialist Party of America, and the PROGRESSIVE PARTY, which had their roots in the political turmoil of the 1890s, emerged full-force in the first decade of the new century. Key to the ability of alternative political parties to gain a foothold in American politics were advancements in communication and the spread of national newspapers and journals that specialized in investigative reporting.

Between 1900 and the outbreak of WORLD WAR I, a loosely aligned group of progressive and radical journalists began warning that the nation's excesses and inequalities were creating a crisis in American society and had to be brought under control. Labeled muckrakers by President THEODORE ROOSEVELT, these writers and journalists elevated the use of investigative journalism and political fiction to new heights. The most prominent muckrakers exposed political and corporate corruption. In so doing, they developed a widespread readership and helped establish investigative journalism as an influential medium of communication. The work of muckrakers began appearing

in an ever-increasing number of newspapers, journals, and books.

From publicly elected officials to the nation's most influential boardrooms, no prominent entity in American life escaped the scrutiny of the new generation of reform journalists. In *The Shame of the Cities*, LINCOLN STEFFENS railed against political machines and the power of business, which—he argued—were lining their pockets, undermining democracy, and corrupting the nation's political, legal, and economic systems at the expense of the common man and traditional values. In 1902, IDA TARBELL exposed how JOHN D. ROCKEFELLER had ruthlessly created a monopoly through his company, STANDARD OIL. In 1904, Tarbell's articles were consolidated in *The History of the Standard Oil Company*. Her attacks on Rockefeller helped create public support for federal antitrust action against Standard Oil that finally broke the company apart in 1911. In a different vein, journalist and author David Graham Phillips addressed political corruption at the highest levels in a 1906 series of articles in *Cosmopolitan*, which he later published as *The Treason of the Senate*. Nor did muckrakers ignore the labor movement. During the 1902 ANTHRACITE COAL STRIKE, Ray Stannard Baker examined the other side of labor in "The Right to Work."

It was the growth of the magazine industry that offered muckraking journalists a forum for their reform crusade. *McClure's Magazine*, founded in 1893 and published until 1929, was the early home of many muckrakers. Lincoln Steffens edited *McClure's* between 1902 and 1906. Determined to make the magazine a financial and political success, Steffens hired a staff of progressive writers and journalists. As editor, Steffens transformed *McClure's* into the leading political magazine in the country. Under his leadership, sales of the magazine expanded, as did its influence among progressives, radicals, socialists, and communists. In 1906 Steffens, along with Tarbell and Baker, decided to leave the magazine to form a new, more radical journal, *American Magazine*.

Between 1900 and 1916, muckraking journalists played an important role in exposing fraud and corruption and in pressuring politicians to make progressive reforms. Public outrage following the publication of UPTON SINCLAIR's muckraking expose of meatpacking in 1906 prompted an investigation of the industry. It convinced Congress and President Theodore Roosevelt of the need for federal intervention and led to the passage of the MEAT INSPECTION ACT (1906) and the PURE FOOD AND DRUG ACT (1906). Other reform legislation influenced by progressive journalists included the HEPBURN ACT (1906), CLAYTON ANTI-TRUST ACT (1914), ADAMSON ACT (1915), WORKMEN'S COMPENSATION ACT (1916), and the child labor KEATING-OWEN ACT (1916).

### **Muller v. Oregon** (1908)

The U.S. Supreme Court decision in *Muller v. Oregon* upheld maximum hours legislation for women. It was an important victory for many female activists. Progressive reformers had concentrated their attention on industrial ills. Their agitation led to enactment of child labor laws, maximum hours and minimum wage legislation, and minimum sanitation and safety standards in a variety of work places. Initial attempts at labor legislation met with mixed reviews from the state and federal courts. The earliest successful campaigns centered on regulating child labor. The special leeway accorded to children soon opened the door for women, who were perceived as similarly disadvantaged. In the long run, the *Muller* decision allowed states to limit the hours of male contractors on state jobs, and then maximum hours legislation for all. Female activists heralded *Muller* as a victory not because of its future impact on men's hours, but rather because they believed that such legislation was necessary to protect women workers. The victory came, however, at the cost of reinforcing women's status as a protected and dependent class.

The issue in *Muller v. Oregon* was a 1903 Oregon act that made it illegal to employ laundresses for more than 10 hours a day. The question was whether the act violated a woman's freedom to contract her own labor. In September 1905, laundry-owner Curt Muller was fined for requiring Emma Gotcher, a laundress and labor activist, to work more than 10 hours on Labor Day. Muller's attorney, William Fenton, was confident that the courts would rule in his client's favor, given recent court decisions in *Ritchie v. People* (1895) and *LOCHNER V. NEW YORK* (1905). The Illinois Supreme Court in *Ritchie* had invalidated a law that would have limited the time a woman could be employed in factories or workshops to no more than eight hours a day. Similarly, in *Lochner*, the U.S. Supreme Court struck down a law that would have set a maximum hours standard for male bakers. In both cases, the courts decided the legislation was an inappropriate usage of the state's police powers and restricted an individual's right to contract without due process of law. In his arguments before the Supreme Court, Fenton reiterated that women were persons and citizens with the same rights as men and therefore had the same right to labor and liberty of contract.

When the *Muller* case was sent on appeal to the U.S. Supreme Court, the National Consumers League approached LOUIS BRANDEIS to defend the maximum hours statute. The league sought to educate the public, lobby legislatures, and pressure employers in order to improve workplace conditions. It also tracked the court battles surrounding the regulatory statutes in which it took interest. As part of their agreement, the league supplied massive amounts of data to support the Brandeis brief in the case.

The famous Brandeis Brief consisted of two pages of legal citations, most of which rested on the *Lochner* precedent. Louis Brandeis believed that the *Lochner* decision allowed that, if a valid reason could be found to justify regulating hours of labor, a statute would withstand judicial scrutiny. Accordingly, Brandeis and the National Consumers League collected employment statistics from Europe and the United States documenting the effects of long hours and hazardous conditions on women workers. Brandeis based his defense of the Oregon law on the state's police powers, the delicate physical condition of women, and their special role as the bearers of children. The health of children, and therefore society's general welfare, depended on protecting women as mothers or future mothers from overwork.

The Supreme Court agreed with Louis Brandeis. Justice David Brewer wrote the Court's unanimous opinion upholding the constitutionality of the Oregon law. Brewer found that, "As healthy mothers are essential to vigorous offspring, the physical well-being of woman becomes an object of public interest," thereby justifying Oregon's use of its police powers. The Court also found that "woman has always been dependent upon man," and because of this, "she is not an equal competitor with her brother." Protective legislation that put unacceptable limits on men's liberty of contract thus could be sustained for women. In concluding, the Court specifically stated that the *Muller* ruling did not overturn the decision in *Lochner v. New York*. The *Muller* decision validated only sex-specific economic protection based on a woman's inherent maternity. Still, the National Consumers League accepted the ruling as a signal victory. It also established a permanent committee in defense of labor laws, and turned its attention to securing minimum wage legislation for women.

## music

Modern American music emerged in the years between 1900 and 1930 as a product of diverse cultural influences. From western European formal composition and the music of eastern European Jews to the broad influences of African-American gospel and blues music, both popular and classical music took on different sounds in these years. Innovations in the technology of music such as the mass marketing of machine recordings and the widespread adoption of RADIO changed the cultural economy of music as did the influence of TIN PAN ALLEY music publishers in New York, the national tours of VAUDEVILLE acts and Broadway musicals, and the MOVIE INDUSTRY. While New York and Chicago became music centers during the period, several other cities, such as New Orleans, Memphis, and Los Angeles, became important both in the development of new musical styles and in the diffusion of music to the national market. The new genres of BLUES and JAZZ and the development of modern classical music incorporated vernacular music from rural and immigrant communities into distinctive American sounds.

At the turn of the century, the music publishing industry of Tin Pan Alley launched songs that became commercial bestsellers and hallmarks of the era. Crossing the line of strict Victorian morals to erotic suggestion, songs like "A Bird in a Gilded Cage" (1900), "In the Good Old Summertime" (1902), "Sweet Adeline" (1903), "Meet Me in St. Louis, Louis" (1904), and "Wait 'Til the Sun Shines, Nellie" (1905) were but a few of the anthems that sold millions of copies of sheet music. The popularity of this music cemented the reputation of New York as the capital of POPULAR CULTURE. Later, composers such as Irving Berlin and GEORGE GERSHWIN started their careers plugging songs at music stores, in restaurants and saloons, and after shows. Audiences were eager for fare as diverse as arias from operas and operettas, folk songs, and spirituals.

Tin Pan Alley linked popular music to the developing musical stage. By the early 1900s, the musical stage, in particular vaudeville and operetta, was the vehicle for new music. With contemporary language, energetic choruses, and sweet melodies, the operetta took off in popularity. The 1907 production of Franz Lehár's *Merry Widow* spun off several road companies that performed the show more than 5,000 times between 1907 and 1908. Sheet music, wax cylinders for phonographs, and piano rolls carried the show songs to a broad national audience. Between 1907 and 1914, operetta held sway on the musical stage. The work of Rudolph Friml (*Rosemarie* [1924] and *The Vagabond*

*King* [1925]) and the prolific Victor Herbert (who wrote 40 operettas during his long career) in *Babes in Toyland* (1903), *The Red Mill* (1906), and *Naughty Marietta* (1910) attracted large followings. African-American musical theater also made a showing with the production of Will Marion Cook's *In Dahomey* in 1902. Eubie Blake contributed his own shows throughout the 1920s. Broadway musicals also provided material for popular music tastes from such composers as Gershwin, George M. Cohan, Jerome Kern, and Cole Porter.

African-American music made its way to Tin Pan Alley in the form of dance music such as the cakewalk and the two-step, dances that further evolved into the Bunny Hug, the Fox Trot, and the Grizzly Bear. Ragtime, which had its origins in the 1890s, continued to have a popular appeal that influenced much of the music coming out of Tin Pan Alley. Ragtime's greatest composer, SCOTT JOPLIN, popularized its rhythms in "Maple Leaf Rag," "Gladiolus Rag," and "The Entertainer." Its influence also appeared in show music such as Berlin's "Alexander's Ragtime Band," published in 1911. The syncopation of ragtime provided the impetus for innovation in music, first through the sweet sound of Dixieland jazz and later in modern jazz music.

In the period between 1910 and 1920, blues began to gain in popularity. W. C. Handy, considered "the father of the blues," was trained as a professional musician but was first exposed to folk blues when playing with a band in Cleveland. Drawing on the folk tradition, Handy composed his own melodies, notably "St. Louis Blues" (1914). By 1910, blues had begun to develop distinctive regional styles; some retained a down-home blues style, accompanied chiefly by slide guitar, and others an urban style (Chicago and Memphis) that relied on a wider range of instruments, including piano, and had a narrative shape not found in folk blues. Urban blues often featured female vocalists, among them Gertrude "Ma" Rainey, Alberta Hunter, and Bessie Smith. Mamie Smith made the first blues recording with her "Crazy Blues" in 1920, which sold 75,000 copies in a few months. The recording industry capitalized on blues popularity in the African-American community with "race records" of both down-home and urban blues.

Influenced by ragtime origins and blues melodies, along with European-style elements, jazz emerged in the late 1910s as a distinctive style. The Original Dixieland Jazz Band, a white band from New Orleans, made the first jazz recordings in 1917. Jelly Roll Morton's piano compositions were first recorded at about the same time. Hotter jazz, the result of introducing blue notes into ragtime's syncopation and incorporating solo improvisations, developed by the 1920s. First heard in the recordings of Chicago-based "King" Oliver's band, with its talented trumpeter Louis Armstrong, jazz quickly spread to Harlem and contributed

to the HARLEM RENAISSANCE revival of African-American cultural forms.

Classical music similarly showed vitality at the turn of the century. Major cities spent the decade cultivating classical music by organizing orchestras and building concert halls. In New York, Carnegie Hall was completed in 1891. Boston followed with Symphony Hall in 1900, and Chicago built Orchestra Hall in 1904. Cincinnati, Cleveland, Minneapolis, Pittsburgh, and Philadelphia established orchestras in the same period of time. Playing largely European music, symphony orchestras and opera companies spread its popularity while encouraging the development of American music. In the early years of the century, academic composers such as Horatio Parker and Charles Cadman added to the operatic and symphonic repertoire. With the spread of phonograph technology, classical music came into average homes. The music industry tapped artists such as maestro Arturo Toscanini and opera singer Enrico Caruso for recordings that made classical music available to listeners from all classes. The new medium of radio and national broadcast networks also created new audiences for what had previously been restricted to the affluent and the professional.

Enrico Caruso (Library of Congress)

The first modern composer in the United States was Charles Ives (1874–1954), whose use of modern techniques of composition predated the two most important European modernist composers, Igor Stravinsky and Arnold Schoenberg. Dissonant harmonies, use of vernacular music, and major-minor tonal structure characterized some of his most important work. A talented musician, Ives gave up professional music and worked in the life insurance industry. After a heart attack caused him to retire in 1918, Ives self-published his early work, including his *Concord Sonata* for piano and flute and his *114 Songs*, an idiosyncratic anthology with a range of musical styles. By 1925, however, Ives stopped composing original work and withdrew from the public. It was only in 1939 when his *Concord Sonata* was performed that his work attracted a wide following among composers and listeners. Ives won the Pulitzer Prize for music in 1947.

The abstraction of Charles Ives's atonal music had little appeal for classical audiences of the time. A more fruitful and popular path came in the work of George Gershwin, who brought together his own mastery of vernacular music with classical composition. His *Rhapsody in Blue* (1924) showed the influence of both popular song and the rhythms of jazz. *An American in Paris* (1928) and the opera *Porgy and Bess* (1935) showed Gershwin's virtuosity in moving back and forth across cultural and artistic lines. His marriage of folk and classical themes set the stage for the later work of composers Aaron Copland, Marc Blitzstein, and Leonard Bernstein. Copland's own career took off with the publication of his *Music for the Theatre* in 1925 and his *Piano Concerto* in 1926.

Beyond the classical realm, there were three important developments in music during the 1920s. First, the sheet music industry centered in Tin Pan Alley began to decline, due to a drop in sales and to rising costs of production. Wartime paper shortages and printers' strikes had driven up the price of sheet music. Sheet music sales also began to fall due to another development. Radio broadcasts, first local and then on the new national networks of NBC and CBS, began to supplant sheet music as a means of reaching the popular audience. Third, sound motion pictures, which were produced beginning in 1927, substituted for touring Broadway productions as a means of introducing songs to the public. In dance clubs, speakeasies, and concert halls, new music, influenced by ragtime and blues, was spread to an ever-widening audience.

African-American music gained in popularity throughout the 1920s. Jazz and urban blues made their "mainstream" cultural breakthrough in the period. New recordings made the transition from "race records," sold to a small segment of the market, to major-label recordings, as Black Swan and Okeh gave way to RCA Victor and Columbia Records. Singers Ma Rainey, Bessie Smith, and Ethel Waters sang of urban love and trouble in songs such as "Ain't Nobody's Business If I Do" and "Prove It on Me Blues." Blind Lemon Jefferson, Blind Blake, and other blues greats could be heard on the airwaves and phonographs singing songs of chain gangs, poverty, and misfired love, and Louis Armstrong made his classic Hot Five and Hot Seven recordings (1925–28) featuring his dazzling solo improvisations. Fletcher Henderson and Edward "Duke" Ellington started jazz orchestras during the 1920s and built audiences for "hot" jazz (later called swing) in Harlem at the Cotton Club and Connie's Inn and the Plantation Club and the Roseland Ballroom uptown. At the same time, white musicians such as Paul Whiteman and his orchestra were able to translate jazz music by sweetening the music with softer tones and formal arrangements designed to appeal to white middle-class listeners.

The cultural character of modern American music had its origins in the decades prior to the Great Depression. By the end of the 1920s, jazz, once exclusively linked to African-American musicians, became the preferred music for up-and-coming white musicians, and vernacular gospel and blues music invaded the realm of high art in the classical compositions of Gershwin and Copland. Modernism in music, like modernism in art and literature, challenged the strict formalism and cultural segregation of the 19th century to produce an art representative of the broad cultural range of urban industrial society.

**Narcotics Act (1914)**

Passed by Congress in 1914, the Narcotics Act was the culmination of two important forces in American life—a Progressive Era effort to reduce drug addiction in the United States and the forces that promoted a new American empire abroad. In the final decades of the 19th century, a growing number of Americans were gripped by the fear that narcotic addiction was undermining society. Influenced by new theories regarding the ways in which drugs affected the body and mind, they sought to control drug use. While the intense focus of the antidrug forces was somewhat novel, the perception that drugs were dangerous was nothing new. Social critics had a long history of battling drugs. For the most part, however, they focused on the evils of alcohol use and abuse. It was not until the 1870s that a number of social reformers began to target narcotics.

Like the battles that were being waged over “demon rum,” class and race played a significant part in the promotion of legal restrictions on narcotics. While the public discussion regarding the “drug problem” focused on southern blacks, the urban poor, and the Chinese, men and women from all levels of society increasingly used narcotics. By the turn of the century, narcotic addiction had spread throughout the social strata. The perceived pervasiveness of the problem led to a more unified call for government regulation.

Police officers and others concerned with the promotion of law and order often blamed drug addicts for increases in criminal activity. They believed that without narcotics use and abuse there would be significantly less crime. Doctors, initially cool to the idea of government regulation, soon joined the chorus of reformers who voiced their concern over the use and abuse of narcotics. As the medical profession became more organized and structured, doctors sought to promote regulation to thwart the distribution of patent medicines. Many doctors viewed unlicensed peddlers of narcotic elixirs as a threat to society and a challenge to their professional standing. Competition was

a main reason for medical professionals to support legal restrictions on narcotics. Fear of competition from patent medicines should not, however, be viewed as the only reason that drug legislation won doctors’ endorsement. Doctors saw firsthand the dangers of addiction among some of their patients and colleagues.

Local laws prohibiting the use of narcotics seemed to be incapable of stemming the use of narcotics. This realization led to a unified call for national regulation. Federal regulation of narcotics was nothing new. The federal government had regulated opium through import taxes, but this was a far cry from federal regulation of what had previously been considered a local problem. In 1906, the federal government took a significant step toward stemming narcotic use with passage of the PURE FOOD AND DRUG ACT. The law challenged the patent medicine industry by requiring that they list all ingredients.

Passed in 1914, the Harrison Narcotics Act was designed to regulate and tax the production, importation, distribution, and use of opium, coca leaves, and other substances derived from them. New York congressman Francis Burton Harrison, who later became governor of the Philippines, sponsored the law in Congress. Harrison’s interest in the Philippines and his role in developing the law were not coincidental. By the early 20th century, the trade in narcotics, largely focused in Asia, had become a major international problem. Britain and China had fought two opium wars over the practice of Britain importing cheap opium from India into China, and American missionaries and merchants saw the practice as undermining Chinese society and morality on the one hand and narrowing the market for American goods on the other.

When the United States took over the government of the Philippine Islands after the Spanish-American War, it sought to change the older system of controlling narcotics that licensed opium addicts and supplied them with opium, a practice that appalled the new military administration in the Philippines. Licensing addicts regulated

Employees of the Bureau of Internal Revenue destroying narcotics, ca. 1920 (*Library of Congress*)

usage and avoided other central issues of the production, distribution, and sale of narcotics. The War Department organized a commission of inquiry under the Episcopal bishop, Charles Brent, to explore alternatives. The Brent Commission argued for new international controls on narcotics, a proposal the State Department endorsed and President THEODORE ROOSEVELT embraced. In 1909, he called for an international conference on opium. The first international conference on opium was held in Shanghai in 1909, and a second followed at The Hague in 1911. The International Opium Convention of 1912, the first international treaty regulating drugs, was the product of these meetings. The treaty largely focused on the British opium trade, but it also opened up the discussion of opium control in the United States. By 1914, Congress was ready to pass a domestic measure to stem the domestic sale of nar-

cotics. Secretary of State WILLIAM JENNINGS BRYAN supported the effort, insisting that the United States needed to develop domestic controls in order to meet its obligations under the international treaty.

For Bryan and others, such as Representative James Robert Mann, the sponsor of the bill in the House and author of the MANN ACT, the Harrison Act offered the opportunity not simply to regulate and tax opium but to curtail its supply and use. A provision in the bill allowed a doctor to prescribe opium for the treatment of disease "in the course of his professional practice only," a phrase that later was interpreted as prohibiting physicians from supplying addicts with opium, since addiction did not qualify as a disease. In effect, the law also prohibited the use of a number of popular narcotics. It required surveillance of narcotic production, greater record keeping, and general

supervision of doctors who prescribed narcotics. Soon after, the courts validated congressional authority to regulate the drug industry. The law favored incarceration over treatment. It turned addicts into criminals. For the next three-quarters of a century, addicts were treated as threats to the social structure and often were incarcerated. Few citizens, apart from concerned physicians, criticized the practice.

Instead, responding to continuing public concern, Congress tightened up the provisions of the Harrison Act, strengthening law enforcement and additional state laws on opiates. In 1924, Congress outlawed the use of heroin, another opiate, prohibiting even its medical uses. By 1926, the *Illinois Medical Journal* declared that those who had sponsored the Harrison Act were “well-meaning blunders.” Prohibition of narcotics had only doubled the profits of those involved in illegal drug trade. It cost the United States more, the journal argued, “to support the bootleggers of both narcotics and alcoholics than there is good coming from the farcical laws now on the statute books.”

Many Americans believed that the Harrison Act was effective in stemming the use and abuse of narcotics. In the years that followed, the act was strengthened. Heroin was banned in 1929. In the 1930s, laws banning marijuana followed. While intense regulation and prohibition were the two most significant forces used by the government to combat drug abuse, they were not the only methods used. The government also began to operate hospitals that aimed at curing those suffering from addiction. These efforts, however, paled in comparison to those that sought to punish drug offenders. At the same time, the combination of legal restrictions and medical treatments allowed most citizens to believe, at least for a number of generations, that the government was winning its war on drugs.

### National American Woman Suffrage Association (NAWSA)

Formed in 1890, the National American Woman Suffrage Association was the result of merging two early associations—the American Woman Suffrage Association, originally led by Lucy Stone and Henry Blackwell, and the National Woman Suffrage Association, which Elizabeth Cady Stanton and Susan B. Anthony organized. The formation of NAWSA signaled the end of a long debate in the WOMAN SUFFRAGE movement about how to obtain the vote for women. The American association had preferred

to work for state suffrage amendments, while Stanton and Anthony's group had focused on court challenges and national campaigns directed at a woman suffrage amendment to the Constitution. Susan B. Anthony, one of the last remaining suffrage pioneers, became president of the new association. In the next decade, there were few victories apart from the recruitment and training of the next generation of suffrage leaders. In the words of suffrage historian Eleanor Flexner, NAWSA suffered “the doldrums,” an inability to build majority support for state suffrage.

With Anthony's retirement from NAWSA in 1900, her chosen heir, CARRIE CHAPMAN CATT, began a series of new campaigns and strategies to further the suffrage cause. First, she tackled the problem of public opinion by cultivating the support of wealthy and well-respected women. She also created a suffrage history to back the movement. Memorials for Susan B. Anthony's leadership, and the simultaneous decline of the more radical Stanton's reputation, educated a new generation of suffragists in the traditions of the women's rights movement.

Between 1900 and 1905, Carrie Catt ably led NAWSA, but her husband's terminal illness led her to resign as president. For the next 10 years, minister, orator, and suffragist Anna Howard Shaw served as head of the organization. Her lack of organizational skill and the continued sense that NAWSA was drifting led Catt, who had worked in New York State for suffrage, to return as head of the organization. When she did, she came back with a highly centralized plan, “the Winning Plan,” to garner support for the passage of a federal amendment giving women the right to vote. NAWSA would now subordinate all state-level efforts to a national campaign. Only by coordinating resources, Catt insisted, could it obtain the needed support for passage and ratification.

As the dominant suffrage organization, NAWSA was able to garner the political and financial support of many wealthy women. At a time when it was most needed to grease the political wheels, NAWSA received a large bequest from the widow of publisher Frank Leslie. The Leslie Fund gave NAWSA an endowment to be used in its suffrage battles. Under Catt's leadership, this money, and growing congressional support, reenergized the suffrage movement and put the cause of women's right to vote constantly before the public.

When the Nineteenth Amendment granting women the right to vote was ratified in 1920, many asked what goal the women's rights movement should tackle next. For those women moved by the carnage of WORLD WAR I, it was the cause of peace. Many joined the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM. For others, such as ALICE PAUL, a former NAWSA member and head of the NATIONAL WOMAN'S PARTY, it was to work for passage of an EQUAL RIGHTS AMENDMENT to fight for

women's full political and economic rights. Catt directed her own efforts toward building the League of Women Voters, a nonpartisan organization to educate and mobilize voters on issues of public interest.

(Cambridge, Mass.: Belknap Press of Harvard University, 1996); Sara Hunter Graham, *Woman Suffrage and the New Democracy* (New Haven, Conn.: Yale University Press, 1996); Rebecca J. Mead, *How the Vote Was Won: Woman Suffrage in the Western United States, 1868–1914* (New York: New York University Press, 2004).

### National Association for the Advancement of Colored People (NAACP)

Founded in New York City in 1909 by African-American and white social reformers and intellectuals, the National Association for the Advancement of Colored People became the dominant civil rights organization in the United States. In response to a 1908 Springfield, Illinois, lynching, a group came together for “the discussion of present evils, the voicing of protests, and the renewal of the struggle for civil and political liberty.” Meeting in 1909 on the centennial of Abraham Lincoln's birth, the gathering included many of the leading white social reformers of the day—JANE ADDAMS, JOHN DEWEY, LINCOLN STEFFENS, and LILLIAN WALD. Six African Americans attended, including W. E. B. DUBOIS and Ida B. Wells-Barnett, chairwoman of the Anti-Lynching League. The participants made plans for a permanent organization that began operation the next year. They pledged themselves and the organization to working toward the elimination of segregation, for African-American voting rights, and for enforcement of the Fourteenth and Fifteenth Amendments, which guaranteed equal protection before the law and the right to vote.

The NAACP merged two earlier civil rights groups, the Constitutional League, which was a white organization, and the NIAGARA MOVEMENT, an African-American organization. Despite having both white and African-American members, whites dominated the NAACP leadership. Some African-American members expressed concern over this, but DuBois, the only African American on the first slate of officers, praised the dedication of the experienced social reformers to the African-Americans' cause. In addition to their commitment, white supporters lent significant financial support and raised funds for the organization.

The NAACP's first goal was to bring the plight of the African Americans to the attention of white America. It began a campaign of speechmaking, lobbying, and publicizing. In 1915, for example, the NAACP led a boycott of

the film, *BIRTH OF A NATION*. The film used offensive racial stereotypes to tell the story of Reconstruction in the South after the Civil War. To help get their message out, the NAACP started a magazine, *The Crisis*. W. E. B. DuBois served as editor from 1909 to 1934 and used his position to expound on the causes he believed important. Given his own growing political radicalism and opposition to Booker T. Washington, DuBois set forth positions on issues in *The Crisis* that sometimes made board members uncomfortable. It strained the relationship between DuBois and the rest of the leadership and eventually led to his ouster in 1934. For 25 years, however, he used his position within the NAACP to shape the debate over civil rights.

The NAACP leadership realized that equal rights called for more than just publicity. In the 1910s, they began to attack racial inequality and segregation in the courts. In 1915, for example, they took on the grandfather clause used by many southern states to disenfranchise African Americans. In 1917, they successfully challenged a Louisville ordinance that required African Americans to live in segregated sections of the city. The NAACP then attacked and won a ruling against restrictive covenants in real estate deeds, which were used to prohibit African Americans from buying certain property. In 1923, it helped bring a case before the courts that ended with a decision that declared unconstitutional the exclusion of African Americans from juries solely due to race. In 1927, the NAACP again attacked the efforts of southern states to prevent African Americans from voting and won a Supreme Court ruling that outlawed the all-white primary.

In 1916, James Weldon Johnson, who later became the first African-American NAACP executive secretary, began a campaign to spread the NAACP into the South. By 1920, nearly half of the organization's members lived there. The NAACP's major campaign in the South was to gather support to pass federal legislation outlawing lynching. To publicize the horrors of lynching, NAACP members undertook an exhaustive investigation into southern racial violence. In 1919, the organization issued a report titled *Thirty Years of Lynching in the United States, 1889–1918*, which listed the details of every incident of lynching it could find. Efforts to push through antilynching legislation failed, but the light of publicity helped reduce lynching.

By 1930 the NAACP had become the dominant civil rights organization in the United States. It has continued to use the techniques developed in its early years of attacking racial discrimination—through publicity, legislation, and the courts—to improve the lives of Americans.

### National Association of Colored Women

The National Association of Colored Women was established in 1896 to further the community support and political efforts of African-American women. By the 1890s, there was a thriving women's club movement that established and maintained institutions for charity, education, health, and social uplift in African-American communities. Combining a mission to help "uplift the race" with a concern for women's progress, such groups differed from white women's clubs by their pointedly political agenda. Faced—like men of their communities—with racial hostility and discrimination in the segregated South and urban North, African-American women sought to find ways to address racial inequality that went beyond pleas for accommodation. The antilynching campaign of Ida B. Wells-Barnett, herself an ardent clubwoman, expressed for many their own instinct to challenge the system and fight back against extralegal violence. When the white press in 1895 attacked Barnett and African-American women for "having no sense of virtue and being altogether of no character," social reformer Josephine St. Pierre Ruffin issued a call for national organization.

At that meeting, women in the Northeast formed the National Federation of African American Women under the leadership of Margaret Murray Washington. At the same time in Washington, D.C., educator MARY CHURCH TERRELL and others created the National League of Colored Women. At a national convention in Washington in 1896, the groups merged to form the National Association of Colored Women (NACW). Taking as its motto, "Lifting as We Climb," the organization had as its goal furthering the work of African-American women's clubs by using their collective political clout to pressure governments and private businesses to address racial inequality. Terrell was elected the NACW's first president in 1896.

The work of the league stretched along the lines of charitable drives, civic improvement, public education, and WOMAN SUFFRAGE campaigns. Inspired by Terrell's words that "Self preservation demands that [we] go among the lowly, the illiterate, even the vicious, to whom [we] are bound by ties of race and sex . . . to reclaim them," the NACW helped to organize and support African-American women's club efforts nationwide. It recruited thousands of members with the goal of bringing women's influence to bear on race politics. By 1914, the black women's club movement had grown to more than 50,000 members in 28 federations and over 1,000 clubs.

The NACW strongly supported woman suffrage as an extension of its goals. Excluded at various times from the work of the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION due to racial prejudice, the NACW developed its own suffrage strategies and campaigns. As NACW member Adele Hunt Logan proclaimed, "If white American women with all their natural advantages need the ballot . . . how much more do black Americans, both male and female, need the strong defense of the vote to help secure their right to life, liberty, and the pursuit of happiness?" The NACW built support among African Americans, who demonstrated greater support for woman suffrage than in the population at large.

The NACW continued to expand its mission and activities in the years after the granting of woman suffrage in 1920. Working toward the abolition of the poll tax in the South, lobbying for the passage of an antilynching law, and maintaining its efforts in relief, education, and civic improvement, the NACW remained a major force in African-American political and social life throughout the first three decades of the 20th century.

### National Association of Manufacturers (NAM)

The economic collapse of 1893 shook American industry to its knees and convinced many financiers and industrialists of the need for more stable markets, less competition, more efficient production, and greater influence on federal and state governments. In 1895, a group of 583 industrial manufacturers from all over the country met in Cincinnati, Ohio, and formed the National Association of Manufacturers (NAM). Under the leadership of Thomas Eagan, the NAM stated that its objectives included the expansion of foreign trade, support for the construction of a PANAMA CANAL, the improvement of domestic transportation, and support for creating a Department of Commerce.

Although the NAM was ostensibly created to promote domestic development and foreign trade, by 1903 it had become vociferously antiunion. Industrial organizing drives by the UNITED MINE WORKERS OF AMERICA, the INDUSTRIAL WORKERS OF THE WORLD (IWW) and, to a lesser extent, the AMERICAN FEDERATION OF LABOR (AFL) had resulted in increased union membership in the nation's factories and mines. In response, the NAM began warning about the deleterious impact of organized labor and encouraging employers to resist organizing initiatives. In particular, the NAM encouraged employers to resist union

efforts to establish closed union shops, in which employees were required to join the union as a condition of employment. Arguing that the closed shop was unconstitutional and un-American, the NAM supported an open shop policy, in which workers, they argued, could choose whether or not they wanted to join a union and pay union dues (see OPEN SHOP MOVEMENT). Under such a system, however, there were no guarantees of workers' right to organize. The NAM also supported the use of yellow-dog contracts, which prohibited employees from ever joining a union.

Between 1900 and 1910, Samuel Gompers and the AFL proved willing to try to work with employers to avoid strikes and keep more radical unions like the IWW at bay. These cooperative efforts, however, proved short-lived as employers and the NAM launched a counteroffensive against organized labor that was halted, only briefly, by the outbreak of WORLD WAR I. With the end of the war, the NAM helped launch an all-out offensive against radicals, socialists, and organized labor. It led the charge in the drive for the open shop, effectively eviscerating labor's wartime gains. Union membership, which had grown from 2 million in 1904 to 5 million in 1921, plummeted over the course of the 1920s. It declined to 3.5 million in 1929, despite the fact that there were millions more industrial workers than in 1904. By 1930, the NAM, which had its roots in coordinating industrial production and the expansion of foreign trade, had become one of the most conservative, anti-union, and influential trade associations in the country.

### National Civic Federation

Formed in 1901 as the brainchild of Chicago newspaperman Ralph Easley, the National Civic Federation had as its purpose creating more harmonious relationships between employers and workers. Taking on issues of labor conflict, employers' liability, workers' compensation, and WELFARE CAPITALISM, the NCF became a leading influence in employee relations and social policy. The NCF had its origins in the Chicago Civic Federation, which had formed in response to the Pullman Strike of 1894. Easley, however, had a broader national vision, and he recruited some of the major business, financial, and political leaders of the day to support the NCF in its mission. Such men as Marcus Hanna, the Republican politician; August Belmont, the railroad magnate; and banker J. P. Morgan were all members

of the NCF. A third party in the creation of the NCF was organized labor. Beginning with the ANTHRACITE COAL STRIKE of 1902, the NCF sought the participation and support of major labor leaders such as Samuel Gompers, president of the AMERICAN FEDERATION OF LABOR, and JOHN MITCHELL of the UNITED MINE WORKERS OF AMERICA.

Labor, too, saw the advantages of working in coalition with corporate leaders. Faced with the open hostility of organizations like the NATIONAL ASSOCIATION OF MANUFACTURERS and the American Anti-Boycott Association, it had to contend with the constant threat of labor injunctions, expensive court cases, and employer resistance. In order to pass employer liability and workers' compensation laws, the labor movement needed allies. It was in the interest of corporate leaders to find common cause with labor on these issues. They, too, sought protection from civil suits in court, and organized labor, ever pragmatic, wanted to find a compromise solution. Finally, the conservative AFL faced the threat of militancy among the working class, including new organizations such as the INDUSTRIAL WORKERS OF THE WORLD (IWW) and the Socialist Party of America, which served as voices of the NEW UNIONISM.

Not all labor leaders were supportive. Socialist labor leader EUGENE V. DEBS described the NCF as "a beast of prey, which always tells its victims, 'our interests are one,' and then devours them." Still, the Civic Federation gave labor leaders Samuel Gompers and John Mitchell unprecedented access to the attention and support of corporate leaders. The attorney who defended Gompers in the *BUCK'S STOVE* case, Alton B. Parker, was a corporate lawyer. State legislatures passed workers' compensation laws that were in part the result of the NCF's work. The NCF also supported mediation between the skilled trades and employers, although most of its business members resisted unionism in their own factories.

The relatively harmonious relations between labor and business in the NCF were short-lived. By WORLD WAR I, founder and NCF secretary Ralph Easley and NCF president Seth Low had moved away from seeing organized labor as a sympathetic ally. The massive strike wave during and after the war prompted many business leaders, including Easley, to greater hostility toward, and opposition to, the organized labor movement. They saw little difference between skilled workers in the AFL and the mass of factory workers who did not belong. Organized workers of any sort constituted a threat. The NCF joined other employer organizations in supporting the suppression of labor in the RED SCARE of 1919–20.

### **National Defense Act (1916)**

Once European nations went to war in 1914, the question of military preparedness arose in the United States. The National Defense Act, passed in 1916, was the first attempt to address the nation's need for greater defense. After the *LUSITANIA* was sunk in May 1915, President WOODROW WILSON dropped his opposition to an American military buildup. In 1916, he toured the country to urge support for preparedness even though he campaigned on the slogan, "Vote for Wilson—Peace with Honor." He declared, "there is such a thing as a man being too proud to fight."

Many, including Wilson's notable opponents, THEODORE ROOSEVELT and HENRY CABOT LODGE, were enraged by Wilson's comments. They had supported preparedness early on. Roosevelt had decried the "Flubdubs and Mollycoddles" who refused to acknowledge the need to strengthen the ARMED FORCES. He and Henry Stimson fought for the expansion of the army under the National Security League.

As early as 1914, the Army War College had composed a "Statement of a Proper Military Policy for the United States." In it the War College pointed out that the United States could no longer depend on its geographic advantages and distance from the continent as a safeguard from invasion. The speed and carrying capacity of ocean vessels, the submarine's capacities, and the wireless all lent increasing access to our coasts. War College analysts cried out for a standing army of at least 500,000 backed by an equipped reserve of equal size. They felt that 18 to 24 months was needed to prepare such an army—and additional time was needed to train them.

In 1916, Wilson's secretary of war, Lindley Garrison, and his assistant, Henry Breckenridge, drew up their own national defense plan. Supported by Wilson, it called for the establishment of a large, volunteer "Continental Army." This army would reach 400,000 men (an increase of 40 percent) who would serve on active duty for two months a year for three years and then become part of a reserve force. When Congress rallied against this idea, Wilson withdrew his support. Garrison and Breckenridge resigned.

In June 1916, Congress passed the National Defense Act. It allowed the president to commandeer factories and establish a government nitrate plant. It further permitted the army to double its size by adding 11,450 officers and 223,580 enlisted men in annual increments over five years. The National Guard could expand to 17,000 officers and 440,000 men.

In spite of the National Defense Act, the nation was unable to recruit to its authorized strength before war

intervened. In April 1917, the regular army consisted of only 5,791 officers and 121,797 enlisted men. The idea that the United States did not need a standing army had a long tradition. Militia and state forces, it was believed, could handle any emergency. Once the nation was in danger, volunteers would show up. Because the nature of warfare had changed, however, both a military draft and training were required. Only the passage of the SELECTIVE SERVICE ACT of 1917 gave the United States the army it needed.

### **National Origins Act (1924)**

Despite growing support for restrictive immigration policies in the early 20th century, some 800,000 immigrants, many from eastern and southern Europe, entered the United States in 1921. Two major pieces of legislation were aimed at restricting this immigration—the IMMIGRATION ACT OF 1917 and the QUOTA ACT of 1921—but the proportion of southern and eastern Europeans remained high. The 1921 Quota Act had attempted to severely limit the number of immigrants that annually could enter the United States. Many in Congress however, felt that the restrictions did not go far enough. By the early 1920s, many Americans felt that the country could no longer accommodate the nearly one million immigrants that had been arriving each year since the 1880s. Moreover, when northern industrial cities received a new source of labor with the influx of African Americans in the GREAT MIGRATION that followed WORLD WAR I, industrial leaders were no longer as apt to push for open immigration policies. Accordingly, one of the chief proponents of restrictive immigration policies, Senator Albert Johnson of the state of Washington, secured passage of far more restrictive legislation in 1924.

The National Origins Act of 1924, also known as the Johnson-Reed Act, reduced the admissible number of immigrants from outside the Western Hemisphere annually to 165,000, less than a fifth of the average prewar level. The sponsors of the 1924 legislation essentially agreed with the findings of the DILLINGHAM COMMISSION, which contended that certain immigrant groups were better suited to assimilating into American society. In particular, the sponsors of the 1924 legislation argued that British, Germans, and Scandinavians were racially superior to other immigrants, and that, consequently, these groups should be allowed to enter the United States in greater numbers.

The 1921 Quota Act had attempted to control the origin of immigrants to the United States by using 1910 as

the base year for determining the number of immigrants from each country allowed to enter the United States. But by 1910, the number of southern and eastern Europeans already in the United States had reached such a level that the quotas did not achieve the results desired by anti-immigration forces. Accordingly, the Johnson-Reed legislation pushed the base year back to 1890. In crafting this new piece of legislation, lawmakers had selected 1890 because they knew that immigrant ranks then had been dominated by groups from Great Britain, Germany, and Scandinavia. Immigrants from Italy, Greece, Poland, and other areas were poorly represented. Under the 1924 National Origins Act, each nationality group was given a quota of 2 percent of its population in the United States according to the official census of 1890, with up to 160,000 total individuals (from all countries) allowed to enter the United States annually. In addition, the 1924 Johnson-Reed Act continued the long-standing policy of excluding Chinese immigrants. It added Japanese and other Asians to the list of ethnic groups that were altogether barred from entering the United States. This new formula for determining the number of immigrants eligible quickly achieved the results that the proponents of immigration restriction had been lobbying for since the early part of the century.

### National Park Service (1916)

In 1916, President WOODROW WILSON signed the bill that established the National Park Service. It was charged with managing and maintaining the nation's system of federal parks and wilderness areas. The Park Service grew out of public concerns about conserving the nation's natural resources and preserving some of the remaining wilderness areas, such as Yellowstone National Park. Yellowstone, the first national park, was established in 1872. The founding of Yosemite National Park followed in 1890. By 1900, the country's national parks included Yellowstone, Yosemite, Sequoia, and Mt. Rainier. They were officially under the control of the U.S. Army. The task of managing the parks was compounded between 1901 and 1909 when President THEODORE ROOSEVELT added 16 million acres of national parkland, some of it through the ANTIQUITIES ACT. After Roosevelt left office in 1909, many of the parks fell into disrepair as no money had been set aside to protect the parks. The result was that poachers and illegal timber operations frequently vandalized the parks. In 1913, Secretary of the Interior Franklin Lane appointed Horace Albright to be

the assistant for parks; but without sufficient resources, the parks continued to deteriorate.

Although pressure to protect the parks had been mounting since 1908, it wasn't until businessman and naturalist Stephen Mather became involved that there was a concerted effort to improve the park system. He spent much of his free time touring the various national parks and became increasingly alarmed at their condition. He expressed his concerns to Secretary Lane in 1914. Lane wrote back, "Steve, if you don't like the way the national parks are being run, come on down to Washington and run them yourself." Mather took Lane up on the offer and went to Washington to lobby for the creation of a National Park Service. Mather used his wealth and influence to convince Congress and President WOODROW WILSON to pass the National Park Service Act in 1916 and to name him its first director. The Park Service's mandate reflected the dual themes of conservationism and public recreation, which have subsequently shaped how the national parks have developed.

In the decades following its formation, the National Park Service continued to struggle to maintain the parks. The National Park Service Act was mandated only a small budget, and Mather found it difficult to both keep the parks maintained and to have them accessible to the public. He and Park Assistant Albright launched an aggressive and ultimately effective campaign to protect the parks by promoting tourism. Automobile ownership and tourism became increasingly common in the 1920s; and by 1930, the national parks began to attract millions of visitors each year.

### National Reclamation Act (Newlands Act) (1902)

The National Reclamation Act of 1902 attempted to resolve long-standing disputes involving control and distribution of water in the American West. Between the end of the Civil War and 1900, hundreds of thousands of Americans moved westward, permanently altering the western landscape and creating conflict over land ownership and control over the region's most precious asset—water. Because much of the western United States is semiarid, water was and is a scarce commodity. As Anglo settlers and recently arrived immigrants moved into the West, conflicts over water and control of land were inevitable. By 1900, largely because of the scarcity of water, large-scale farming

operations had gained the upper hand over small, freehold farmers. Nevertheless, conflicts over water remained and persistently threatened to undermine the viability of small- and large-scale farms.

The scarcity of water, when combined with several decades of falling food prices, placed many western farms in a precarious position by the turn of the century. Pressure on the federal government to intervene mounted. In 1901, Democrats in Congress introduced legislation aimed at ensuring that western farmers had the funds to secure enough water. Senator Francis G. Newlands (D-Nevada) sponsored the legislation. He had come to power in Nevada through land speculation and championing the construction of dams and water projects. President THEODORE ROOSEVELT and his secretary of the interior, Ethan Allen Hitchcock, also supported the reclamation bill, but other Republicans, including the influential Speaker of the House, JOSEPH CANNON, opposed its passage.

Largely due to Roosevelt's support, the legislation passed the House and Senate, and it was signed into law in 1902. In its final version, the legislation pooled the proceeds from the sale of public land in 16 western states into a fund that would then be used to build irrigation projects throughout the West. The Reclamation Act gave final responsibility and authority over the construction of these large-scale projects to the federal government. It was hoped that, once the projects were completed, farmers and landowners would be responsible for their maintenance and upkeep and that within 10 years the proceeds from land sales and water usage rights would offset any construction costs. The bill's authors thought that limiting land sales to 160-acre parcels would encourage settlement and family farming. Because of the size and expense of the irrigation projects, however, the expense and upkeep frequently fell to the federal government and the newly created Federal Bureau of Reclamation. Several projects began almost immediately after the legislation was enacted, including the Newlands Project and construction of the Salt River Dam.

Over the long term, the Reclamation Act had a tremendous impact on the development of the modern West. It paved the way for the construction of aqueducts and massive dams, including the Hoover Dam in Colorado, the Grand Coulee Dam on the Columbia River, and the Glenn Canyon Dam in Dinosaur National Park. In addition, because the acreage limitations were not strictly followed and access to inexpensive water never materialized, its impact on family farming remained limited. Instead, the construction of these aqueducts and dams enabled large-scale corporate farmers to secure a sufficient water supply for crops hundreds of miles away, giving them a competitive advantage over small, independent farmers.

### National War Labor Board (NWLB)

The National War Labor Board (NWLB) was created in 1918 by President WOODROW WILSON in an attempt to formalize a federal policy for dealing with organized labor during WORLD WAR I. When the United States declared war on Germany, the Wilson administration, business leaders, and others believed it essential to create a war labor board to ensure that labor disputes did not disrupt war preparations. Prior to this time, the federal government's involvement in labor disputes tended to be limited to enforcing injunctions, breaking strikes, and keeping surveillance on labor radicals. Samuel Gompers and the conservative AMERICAN FEDERATION OF LABOR (AFL) hoped that would change with American entry into war. War and its dependence on defense production, Gompers believed, offered a golden opportunity to ensure that responsible craft unions were allowed to organize and negotiate contracts supported by the federal government. Other labor leaders and progressives supported American participation in the war, believing the Wilson administration's rhetoric that it was a war to make the world safe for democracy.

With the creation of the NWLB in 1918, the AFL and the Wilson administration had worked out a blueprint that would last throughout the war. The AFL agreed to a no-strike pledge and the maintenance of open shop, nonunion workplaces. In exchange, business leaders agreed to pay union wages and refrain from the worst forms of antilabor behavior that had been typical before the war. The two most prominent members of the NWLB were former president WILLIAM HOWARD TAFT and labor progressive Frank Walsh. Initially the NWLB had a fairly positive impact on organized labor as the board did in fact curtail some of the most flagrant antiunion practices, such as forcing workers to sign yellow-dog contracts that prohibited them from joining unions. Although the NWLB acted decisively in only a few dozen cases, its support of organized labor in some rulings was almost unprecedented. The impact of the NWLB, however, was short-lived. The end of World War I in November 1918 brought with it immediate employer demands for the return of prewar labor relations. Specifically, employers insisted that since the nation was no longer dependent upon defense production, it was not appropriate for the federal government to intervene on behalf of workers and organized labor. War-time agreements in such industries as meatpacking were

soon invalidated. By December 1918, the power of the NWLB had been effectively demolished.

### National Woman's Party (NWP)

The National Woman's Party (NWP) was organized in 1916 as a by-product of the Congressional Union for Woman Suffrage. Led by ALICE PAUL, the NWP focused on securing a federal amendment for WOMAN SUFFRAGE. Unlike the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION (NAWSA) for which Paul once worked, the NWP adopted radical tactics of direct action. Devoted to a federal campaign rather than local and state efforts, the NWP spent most of its energies lobbying CONGRESS, running political campaigns, and organizing public protests. Influenced by British suffragists, the NWP pioneered in dramatic methods to draw attention to woman suffrage. The women of NWP stepped into such male arenas as union halls and lumber and mining camps to ask support for women's right to vote. Their most controversial activities, however, occurred in the nation's capital. From January 1917 to mid-1918, NWP representatives held ongoing picket lines, complete with clever slogans and photo placards, outside the White House and Congress.

The NWP drew national attention, especially after the United States entered WORLD WAR I, as its pickets became the targets of counter-protests. The NWP's "silent sentinels" outside the White House were arrested for disturbing the peace, and 168 served sentences. In jail, Alice Paul and others went on a hunger strike. Violence against suffragists escalated, culminating in the November 1917 "Night of Terror," during which suffragists, including Dorothy Day, were attacked and beaten by jail guards. Pickets continued unabated. In fact, suffragists employed increasingly dramatic tactics such as burning copies of President WOODROW WILSON's speeches in ceremonies in Washington, D.C., in order to humiliate the president for not supporting woman suffrage.

The NWP's philosophy and tactics drew criticism from the more genteel suffragists of the NAWSA, who condemned NWP for alienating potential supporters and opposing the nation's war effort. NWP's tactics and political positions, however, made NAWSA appear much more respectable to suffrage supporters in Congress. In early 1918, Wilson finally came out in support of woman suffrage. In June 1919, the Senate passed the Nineteenth Amendment, giving women the right to vote. It joined the

House, which had already done so in 1918. The amendment was ratified in 1920.

Although NAWSA accepted the credit for passage of the woman suffrage amendment, the impact of the NWP cannot be dismissed. Its demands, leadership, and methods rendered woman suffrage a national issue. Male politicians could no longer ignore or ridicule suffragists; they now had to respond to them out of fear that the NWP might target them with protests or electoral opposition.

After securing women's right to vote, the NWP turned its attention to the EQUAL RIGHTS AMENDMENT (ERA), which was first introduced in Congress in 1923. The party sought to end legal and economic discrimination based on sex, an issue that brought it into conflict with progressive activists who wanted to preserve legislation for women. The party's focus on the ERA set the stage for future feminist challenges to the economic and political status quo based on women's demands for equality. As second-wave feminism emerged, new calls for the ERA were heard in the 1960s and 1970s. By that time, the NWP was no longer a prominent voice.

### National Women's Trade Union League (NWTUL)

The Progressive Era saw the flourishing of women's organizing on a wide range of issues. One of the most fertile areas was the plight of working women. Facing poverty, poor working conditions, and personal danger in the workplace, as in the city streets, women workers had few means with which to combat inequality. Organized labor, long the recourse of skilled workingmen, was noted for its hostility toward women in the workplace and in the union. With few allies, working women often had to rely on their own scant resources. In Great Britain at the turn of the century, middle-class and elite women organized a support group for women workers and their unions called the Women's Trade Union League. Following their example, American socialists, among them William English Walling and Mary Kenney O'Sullivan, sought to organize a similar association. At two meetings in Boston in 1903, settlement house workers, labor union leaders, and others formed the National Women's Trade Union League (NWTUL). The league's first president was Mary Morton Kehew; Jane Addams was first vice president, and Mary O'Sullivan first secretary. Labor reformers in Boston, Chicago, and New York quickly formed local branches of the league to address the poor conditions and poverty faced by women in the workplace.

In 1906, Mary Dreier Robins, a labor reformer and wife of Chicago settlement house worker Raymond Robins, became NWTUL president. She remained in the office until 1922.

Built on a model of cross-class solidarity, the NWTUL brought working women and middle-class women together to improve the condition of women in the workplace. In this effort, they had a range of tactics—public education, social investigation, support for unions in organizing drives and strikes, and lobbying state legislatures and Congress for protective labor laws. During the league's first two years, it supported strikes in Chicago; Troy, New York; and Fall River, Massachusetts.

The event that catapulted the NWTUL to national attention was the 1909–10 SHIRTWAIST MAKERS STRIKE in New York City. During that strike, the NWTUL raised money for strikers' relief and bail, helped to revitalize local 25 of the INTERNATIONAL LADIES' GARMENT WORKERS UNION (ILGWU), and organized mass meetings and picket lines. Early on, reports of the arrest of women pickets and police harassment fueled public outrage at the treatment of the young workers. When middle-class women allies, including the New York Women's Trade Union League president Margaret Dreier, were jailed for participating in the picketing, public pressure on garment firms to settle the strike increased.

In the midst of the shirtwaist strike, NWTUL members William Walling, Mary Dreier, Helen Marot, Leonora O'Reilly, and LILLIAN WALD helped found the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE, a move that helped solidify support for the strikers and avoided the possibility of African-American strikebreakers. Still, larger firms proved resistant to public pressure to settle the strike. The strike ended when garment manufacturers broke down worker resistance, and many returned to work. Despite the loss, the NWTUL took credit for solidifying its goals by reviving ILGWU labor organizing in the garment trade.

The national NWTUL progressively worked to investigate working conditions, conduct union organizing campaigns, and support women workers in strikes across the nation. Its support of the organizing campaign in men's clothing led to the founding of the Amalgamated Clothing Workers. The league also understood the need for publicity and education for the public. Its journal, *Life and Labor*, edited by Australians Alice Henry and Stella Franklin, served as a forum to educate women workers in citizenship, labor history, and union practice. Once the NWTUL came out in support of WOMAN SUFFRAGE, the journal also informed its readers about the progress of suffrage campaigns. Beginning in 1915, the Chicago branch of the NWTUL formed a leadership school that recruited women workers nationally. As union membership began to decline

in the 1920s, the NWTUL turned its primary attention to protective labor legislation, especially minimum wage and maximum hour laws for women. This turn cost the league members and relegated much of its activity to lobbying. Under Rose Schneiderman, its next president, the league continued to press for labor legislation throughout the 1920s.

## Native Americans

In the late 19th century, reformers responding to the devastation of the Native American population began to formulate policies aimed toward assimilating native peoples. In some ways, their campaign to bring "civilization" to their charges was well-intentioned. They thought that education, property ownership, and religious conversion were the means by which Native Americans could achieve equal citizenship. At the same time, support for assimilation was deeply colored by misunderstanding and even fear and hatred of Native American language, religion, and cultural practices. In their challenge to Native American tribalism, with its collective land ownership, nomadic ways, and animistic religion, reformers cooperated with others whose main purpose was to use and exploit Native American land and resources.

A threefold plan to assimilate Native Americans became the major driving force behind the U.S. government's policy in the Bureau of Indian Affairs. Through allotment policy, the government assigned individuals' plots of land from the reservation and sold the surplus. It developed a system of BIA boarding and day schools to educate Native American children in English and in industrial and agricultural skills; and it replaced tribal authority in criminal trials with federal, state, and local courts. The undermining of tribal government effectively ended tribal sovereignty. By granting Native Americans citizenship in conjunction with allotment and military service, or in the comprehensive Indian Citizenship Act of 1924, the U.S. Congress finally and forcibly integrated Native Americans into the nation. However, it was not until after World War II that some states granted Native Americans the right to vote or equal political rights.

After 1900, the policy of allotment, first begun under the Dawes Severalty Act (1887), began to take its toll on Native American land ownership. The original legislation

A group of young Native American men and women at the U.S. Indian School, Carlisle, Pennsylvania, participate in an art class. (*Library of Congress*)

had put breaks on the ability of land speculators and corporations to take advantage of the allotment system and buy or lease the millions of acres of Native American reservation land. Allotted land had been put in trust for 25 years to ensure that it would not be sold wholesale to non-Native Americans. Each land sale or lease had to be approved by the Department of the Interior. Under pressure from railroad corporations, who sought the right-of-way on reservations, from oil and mining companies looking for mineral leases, and from timber companies and cattle syndicates, the Congress responded with a new series of laws that speeded up the allotment of land. In 1898, the Curtis Act ended tribal sovereignty in the Indian Territory. In 1902, the Dead Indian Land Act gave the right to Native Americans to sell inherited property, and the BURKE ACT put more Native American land at risk by eliminating the 25-year trust period. More than 90 million acres of reservation land were transferred to non-Native Americans between 1887 and 1932. While more than 100,000 Native Americans had

received individual allotments, most of the land had been sold as “surplus” to non-Native American owners.

Connected to the policy of allotment was the transfer of criminal and civil legal cases from tribal authority to the federal and state court system. In part the transfer was designed to dismantle tribal authority and the separate sovereignty of Indian nations. Another consequence was that the shift to state courts aided the transfer of Native American land to white authorities. County courts soon provided supervision for, and later guardianship of, Native American lands, and the practice led to abuses. There was no compensation for the loss of tribal sovereignty. Few states accepted that Native Americans had equal political or civil rights, and in some states, Native Americans were denied the right to vote. This left them vulnerable to state and local courts. By declaring its owners legally incompetent, for example, courts and lawyers in the former Indian Territory of Oklahoma simply usurped control over Native American land and sold or leased it to mining, oil, timber, and cattle

corporations. Court challenges to the forcible allotment of land, such as *LONE WOLF v. HITCHCOCK*, only confirmed the second-class status of Native Americans under the law.

Along with allotment came the creation of a federal school system for Native Americans. In the schools, native languages, religious practices, dances, and chants were forbidden, as they were on many reservations under government supervision. Despite substantial resistance to Christianity and white education, however, the Bureau of Indian Affairs continued to push for its agenda of assimilation. In 1918, Congress passed a law granting citizenship to Native Americans who served their country in the military during the war; and in 1924, the Indian Citizenship Act granted citizenship to all Native Americans who had not yet been naturalized.

Despite the assault on tribal land and authorities, many Native American communities proved resilient to the threat of federal and state policies. Not only through formal organization but also by retaining tribal independence, such tribes as the Navajo, Yuma, Pueblo, Hopi, Seneca, and Seminole successfully sidestepped allotment and the destructive policies of the period. For other reasons, the cessation of warfare, improvement in health care and nutrition, in particular the decline in the incidence of tuberculosis, and the creation of stable communities, the Native American population, in decline for hundreds of years, began to show signs of recovery and revival. From a low of 237,000 in the Bureau of Indian Affairs census of 1900, there was a slow growth in population to nearly 335,000 in 1930. Changes in Native American mortality were central to this growth. Life expectancy for Native Americans in 1900 was 30 to 35 years on average, significantly lower than the 50 years for the general population. Fertility also increased, as the population received better health care.

There were signs of a significant political revival as well. New groups, often coalitions of Native Americans and their white allies, took on the issues of Indian rights after 1910. The Four Mothers Society, the Society of American Indians (later the American Indian Association), the Indian Rights Association, and the American Indian Defense Association fought to stop the illegal seizure of lands attempted by Albert Fall, the secretary of the interior responsible for TEAPOT DOME, and supported legislation such as the Pueblo Lands Act, which defended land ownership and pushed for additional compensation for lands already lost. These groups also lobbied Congress to study Native American policies and conditions on reservations. In a 1924 report, *The Indian Problem*, a committee of 100 reviewed federal policy and upheld the land rights of Native Americans. In 1928, the Merriam Report on the Problem of Indian Administration directly linked allotment policy to the widespread poverty, high infant mortality, and low life expectancy of Native Americans. The Merriam Report

called for the reorganization of the Bureau of Indian Affairs and improvement of living conditions. By the 1930s, with the Native American population recovering and the advent of a new, more sympathetic administration under Secretary of the Interior John Collier, the policy of assimilation ground to a halt.

## nativism

During the first decades of the 20th century, nativism—what historian John Higham defined as “an intense opposition to an internal minority on the ground of its foreign (i.e., “un-American”) connections”—became a significant force in American culture. Often associated with opposition to IMMIGRATION, nativism resulted from fears that the core cultural, social, and racial elements that composed the American national character were under attack. Such fears were nothing new in American history, but a number of factors combined to fuel several virulent outbreaks of nativist sentiment. More immigrants were coming to the United States than ever before. Six million arrived during the years from 1900 to 1910 alone, and more were coming from southeastern Europe, Asia, and Latin America. These new immigrants were perceived as being more culturally and racially different from “native-born” Americans than earlier groups from northern and western Europe. As the United States experienced the economic and social turmoil that accompanied rapid industrial expansion, the foreign-born frequently were blamed for the problems facing the country. They also were perceived as a source of dangerous “radical” sentiments that led to further strikes and labor unrest. Fears of immigrants increased again during WORLD WAR I, when these potentially disloyal Americans were urged to prove that they were “100 percent” Americans rather than hyphenated German-Americans or Irish-Americans.

Nativists’ fears of the “foreign” elements within the United States manifested in a number of ways. Some sought to encourage immigrants to “Americanize” themselves as quickly as possible once in the United States, abandoning their old language and customs for American ones. Although some social scientists, such as Horace Kallen, argued that it was wrong to force immigrants to abandon their culture, AMERICANIZATION programs achieved a

wide range of acceptance in the United States at this time. These attempts to create a homogeneous American culture and impose it on immigrants took place in all areas of life, including efforts to insure English-only instruction in public schools, settlement houses that sought to teach immigrant women English and American customs, and workplace education programs that glorified the “melting pot” and “100 percent Americanism.” Nativist organizations formed to push for programs such as these and to try to enforce conformity among the immigrant population, including the revived KU KLUX KLAN, which engaged in anti-immigrant, anti-Catholic, and anti-African American activities during these years.

Not all nativists believed that immigrants could be fully “Americanized.” They were particularly suspicious of immigrants from southeastern Europe and Asia. Many of the southeastern European immigrants belonged to the Catholic Church or practiced Judaism, religions that Protestant nativists had long distrusted and feared. Many working-class activists involved in labor protests were also immigrants from that part of the world. Particularly after the RUSSIAN REVOLUTION in 1917, immigrants from eastern Europe were perceived as a source of radical and “un-American” ideas. Finally, both southeastern Europeans and Asians were seen as racially different from the Anglo-Saxon “race” from which the majority white population supposedly was descended. This had been true of Asians since the mid-19th century, but increasingly, southeastern Europeans also were seen as biologically different and thus impossible to assimilate.

The nativist response was to press for laws restricting immigration, particularly from those parts of the world. Their earliest successes came in barring Asian immigrants. The 1882 Chinese Exclusion Act greatly restricted the ability of Chinese immigrants to gain access to the United States. In 1907, Japanese immigration was largely barred when the Japanese government agreed not to allow its citizens to move to the United States in the GENTLEMEN’S AGREEMENT, which was extended further by the provision for an Asiatic Barred Zone in the EXPATRIATION ACT of 1907. Asians already in the United States found that they were ineligible for CITIZENSHIP and faced segregation and organized discrimination in many areas of life, such as the movement to prevent Japanese-Americans from owning farmland in California.

Other laws targeted immigrants more generally. The Expatriation Act revoked the citizenship of any American woman who married a foreign man, exhibiting both a desire to discourage immigration and also to prevent American women from falling into the hands of un-American men. The idea of accepting only those immigrants who met certain standards for health and education became increasingly popular with nativists, and the IMMIGRATION ACT OF

1917 instituted both literacy tests and health standards for immigration. World War I served as the context for further revision of the immigration laws as nativists played on fears of foreign-born radicals subverting the war effort. Nativist sentiment, combined with a concerted effort to silence domestic opposition to American participation in the war, fueled both the RED SCARE of 1919–20 and the wave of deportations that followed it.

Attempts to bar undesirable immigration peaked in the early 1920s, as both immigration and labor unrest increased again in the wake of World War I. The QUOTA ACT of 1921 and the NATIONAL ORIGINS ACT of 1924 were aimed specifically at reducing the number of “racially different” immigrants arriving. These laws assigned each country an immigration quota with the result that the old immigrants from northwestern Europe received larger quotas than the new immigrants from southeastern Europe and Asia. These laws effectively ended immigration from areas outside of northwestern Europe and the Americas, which were exempted.

As the numbers of immigrants arriving in the United States dropped dramatically, nativist sentiment began to decline. It was harder to argue that there was an organized foreign threat to the American national character in the absence of large numbers of foreigners. However, the immigration laws created at this time remained the basis for American immigration policy until they were revised in the 1965 Immigration Act during the presidency of Lyndon Baines Johnson.

### Naval Disarmament Conference (1927)

In 1927 the major powers met at the Geneva Conference on Naval Disarmament to negotiate for more extensive reductions in naval armaments than they had agreed to at the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT of 1921–22. Competing national interests frustrated their efforts. Failing to reach an agreement at the Geneva Conference had important consequences for the future of peace and stability around the world. Although at first the United States stayed out of an arms race for budgetary reasons, Japan and Great Britain competed in a naval buildup that eventually helped to bring about World War II.

The limitation of naval armaments seemed like a realistic possibility in the 1920s. The major powers first successfully concluded a round of agreements at the Washington Conference on Naval Disarmament in 1922. At the same time, the LEAGUE OF NATIONS had been working, without the participation of the United States, for limitations of both land and sea armaments. Although the TREATY OF VERSAILLES had limited only German armaments, it reiterated the need for general limitations among the major powers.

Under the administration of President CALVIN COOLIDGE, the United States hoped to reach agreements that would lead to broad-based naval disarmament. Although the Washington Conference had set limits on the size of warships and aircraft carriers of the major powers, it left a loophole for smaller ships. The naval powers used the loophole to strengthen their military on the seas. In 1927 the Coolidge administration called for another conference, hoping to reach an expanded naval agreement. Meetings between the United States, Britain, and Japan took place in Geneva, but the French and Italians refused to participate in the conference. The French were disgruntled at being placed in the same class of military power as Italy at the 1921–22 conference. The Italians would not attend if the French did not show up. Meanwhile, Britain and Japan refused to stop their naval arms race in cruisers. After meeting for several months, the conference ended without an agreement. After the failure of the Geneva Conference, the U.S. Congress passed legislation that, in effect, placed the United States in the arms race. A few weeks before Coolidge left office in 1929, Congress passed a bill that provided for the construction of 15 heavy cruisers and an aircraft carrier.

Representatives of the major powers met once again for a naval disarmament conference in 1930 as they faced a world economic crisis. Facing an international economic depression, governments recognized that a reasonable place to cut costs significantly was in spending on their navies. The conference agreed to extend the limits of the 1922 Washington agreement to lighter ships. In addition, America, Britain, and Japan agreed to limit their navies at a 5:5:3 ratio. Italy and France signed the agreement as well. Although the two countries could not agree on a ratio between them, they agreed to resolve the dispute within two years. As international tensions heightened in the 1930s, due to Japan's expansion in Asia and the continued British presence, no agreement could be reached.

## neutrality

Neutrality is a legal concept whereby a nation seeks to avoid military involvement in armed conflicts between belligerent states. Neutral powers are permitted to engage in all legal international trade and transactions. Laws concerning the rights and duties of neutrality are contained in the Declaration of Paris of 1856, Hague Convention V (1907) under “neutrality in land war,” and the Hague Convention XIII (1907) under “neutrality in maritime war.” Neutral parties are required to issue either a general or a special declaration when hostilities break out, although the declaration of neutrality may be repealed or modified.

Certain rights are implicit in a country's declaration of neutrality. One of these is the right to territorial integrity. Territory may be defined as air space, water, or land. Those who are engaging in a war may not use a neutral's territory as a base of operations or engage in hostilities on or in it. A neutral also has the right to maintain diplomatic communications with other neutrals and with the warring parties, the right to demand compliance with domestic regulations set to secure neutrality, and the right to demand warring parties not interfere with commercial endeavors of its citizens.

Early on, the American Republic had struggled with issues of neutral rights in a world rife with European conflicts that often disrupted trade. As a commercial nation, the United States embraced the concept of “free ships, free goods.” This concept held that the nationality of a ship determined the status of its cargo and that only contraband (forbidden goods) on neutral ships would be subject to capture. The issue was fought over with France in the “Quasi-war” in 1797, during the Napoleonic Wars, and finally in the War of 1812. Only in 1856 did the European powers guarantee “free ships, free goods” to neutral powers in wartime.

After WORLD WAR I began in 1914, Britain greatly expanded its contraband list. It intended to enforce a “continuous voyage” doctrine. Under this doctrine, a nation at war could seize a ship en route from one neutral port to another if its cargo were destined for an enemy nation. President WOODROW WILSON immediately protested Britain's actions as a violation of a neutral power's rights. Germany added to the problem when it declared that the waters around Britain were a war zone in which all ships, even neutral ones, could be sunk without warning. Wilson threatened war in the eventuality that any American ship was sunk without warning or without thought for the safety of passengers and crew. Between 1914 and 1917, Wilson successfully kept the United States neutral by maintaining trading rights with Britain while not provoking Germany.

When the war dragged on into its fourth year, the Germans called Wilson's bluff. He broke off diplomatic relations with Germany, but he refused to declare war unless

Germany were to undertake “overt” acts against American lives and property. Wilson proposed instead that American ships be armed, but a filibuster of isolationist congressmen prevented this. The ZIMMERMANN TELEGRAM, in which the German foreign secretary proposed a secret Mexican-German alliance, was published in March 1917. It produced the predictable ill will toward Germany. Even worse, the long dreaded “overt” acts directly followed the publication of the telegram when Germany sank four unarmed American merchant vessels.

German violations of American neutrality rights forced Wilson’s hand. On April 2, 1917, he asked Congress for a declaration of war. German U-boats had now pushed a wavering country to enter the war. Six senators and 50 representatives voted against overcoming neutrality and going to war, but the goal of making the world safe from the submarine was not compelling enough to inspire the country’s patriotism. In his declaration of war, Wilson transcended commerce and widened the scope of the war to include making the world safe for democracy. His idealistic vision won the support of a majority of Americans.

## New Freedom

Writing about his new reform program or the “New Freedom,” President WOODROW WILSON wrote, “the concern of patriotic men is to put our government again on its right basis by substituting the popular will for the rule of guardians, the processes of common council for those of private arrangement.” To do this, the Wilson administration would let the light in on all government affairs. Wilson sought to substitute public for private machinery in overseeing the economy and society. In the 1912 election Wilson voiced his program of reform as the “New Freedom,” hearkening back to the American ideal of family farms and small businesses and fair competition. Roosevelt, his major opponent, called for a New Nationalism of increased federal government power. Wilson won the day.

The DEMOCRATIC PARTY regained the presidency under Wilson in 1912 due, in great part, to divisions within the REPUBLICAN PARTY. THEODORE ROOSEVELT’s decision to establish the PROGRESSIVE PARTY cost the incumbent WILLIAM HOWARD TAFT the presidency. Wilson’s own progressive policy, the “New Freedom,” concentrated on opening the processes of politics and capital.

Wilson’s hallmark “New Freedom” legislation included tariff, currency, election, banking, and child labor reform.

The Wilson administration’s first attacks on the domestic front were on TARIFFS, the banks, and the trusts, known as the “triple wall of privilege.” Wilson personally presented his appeal to Congress for the Underwood Tariff Bill, which instituted a large reduction in rates and import fees. Many thought Wilson was committing political suicide, but he felt that the existing tariff placed undue hardship on average Americans. Wilson was successful in his lobbying efforts on the bill. A related measure was the new progressive income tax attached to the bill.

A second area of interest for Wilson’s New Freedom was the banking system. Once again, Wilson took his appeal to the “sovereign people” and won. In 1913 he signed the FEDERAL RESERVE ACT. This act created the new Federal Reserve Board, which controlled 12 regional reserve districts, each with a central bank. They issued federal reserve notes backed by paper money, thus controlling the amount of currency. Trusts also were targeted with the FEDERAL TRADE COMMISSION ACT of 1914. This commission focused on monopolies and tried to prevent unfair trade practices. Other progressive measures put forth under Wilson included the FEDERAL FARM LOAN ACT of 1916, making credit available to farmers at low interest rates; the WORKMEN’S COMPENSATION ACT of 1916 for federal civil service employees; and the ADAMSON ACT of 1916, establishing an eight-hour day for railroad workers. In 1916 the child labor KEATING-OWEN ACT was passed, which prohibited the shipment of products that had been made by workers under 14 years of age for some products and 16 for others. A Supreme Court decision later declared the act unconstitutional, but it was an important first step toward barring child labor.

Finally, the Seventeenth Amendment to the Constitution, which provided for the DIRECT ELECTION OF SENATORS and was considered a move toward more democratic representation, was passed during the Wilson years. It was designed to take away the influence of “party machines” and other threats to democratic elections. Wilson strove to give selection of candidates over to direct primaries and elections and get it out of the hands of “small groups of men.” Wilson had wanted to leave a legacy more concerned with human rights than property rights.

## New Nationalism

During his first term in office, President THEODORE ROOSEVELT became increasingly aware of the power of

corporations in public life. He targeted the large trusts, specifically Northern Securities and STANDARD OIL, for the worst abuses of the monopoly power to distort the market and corrupt the political process. For Roosevelt, however, the size of corporations was not the issue; it was how corporations used their power. To keep monopoly in check, what was needed was for government to regulate the large trusts. If the United States was to become a world power, it needed both powerful corporations and a strong, centralized federal government. Shared by many progressive reformers, this philosophy became known as the "New Nationalism." The New Nationalism took as its manifesto Herbert Croly's book, *The Promise of American Life* (1909). Croly argued that the major aim of progressive reform should be "to secure the maximum production from a private system with the most widespread diffusion of benefits as possible." Roosevelt agreed. As he announced to an audience in Osawatomie, Kansas, in 1911, true progressives would "recognize the inevitableness and the necessity of combinations in business and meet it by a corresponding increase in governmental power over big business." A year later, at the PROGRESSIVE PARTY convention, Roosevelt further developed these ideas, targeting the federal courts for criticism and arguing for greater federal power to regulate. He observed that it would take a powerful central government to control the force of Big Business. What was more, as federal courts continued to decide that new state legislation was unconstitutional, Roosevelt sided with those who viewed the courts as major obstacles to progressive reform. As he later asserted, the courts had created a safe neutral zone for corporate "lawlessness," in which neither state nor federal governments could act. He based his arguments on the claim that communities had the power to regulate property for the public good.

Roosevelt's political philosophy stood in stark contrast to those for whom small businesses, family farms, and voluntary organization were the primary means of securing American democracy. While he listened to their rhetoric, he characterized their belief as "rural toryism." They wished, he believed, to "attempt the impossible task of returning to the economic conditions that obtained sixty years ago." In the election of 1912, the divided soul of PROGRESSIVISM was on display. While Roosevelt and his party embraced the growth of government, Democratic candidate WOODROW WILSON and his supporters, including WILLIAM JENNINGS BRYAN and future Supreme Court justice LOUIS BRANDEIS, echoed their fears that a powerful government could overshadow competition in the marketplace and individual liberty. As Roosevelt thundered about the New Nationalism on the campaign trail, Wilson articulated his beliefs and those of others as the NEW FREEDOM. In many ways, the election of 1912 and the battle over the role of government marked the first modern election. At the same

time, the irony of the debate was that Wilson, the voice of the New Freedom, became an even more powerful president than Roosevelt, as his administration faced participation in WORLD WAR I. By virtue of his wartime government, Wilson took on the powers of a strong federal government for which the New Nationalism had clamored.

## New Unionism

New Unionism refers to efforts to organize American workers in ways that sharply contrasted with the more conservative methods of the AMERICAN FEDERATION OF LABOR (AFL). Led by Samuel Gompers, it focused its organizing efforts on forming trade unions among skilled workers who were overwhelmingly white, male, and native-born. The AFL became the nation's first firmly established and influential labor organization and solidified its position by eschewing radical politics and labor violence. At times, it worked cooperatively with employers both in the workplace and through organizations such as the NATIONAL CIVIC FEDERATION.

Despite the AFL's success, the vast majority of American workers remained unorganized and poorly paid. Among the reasons for this failure were the increasing use of SCIENTIFIC MANAGEMENT techniques in MASS PRODUCTION and the wave of new immigrants from eastern and southern Europe, who competed with each other for factory jobs. The nature of work itself also was changing. Receding were the days when skilled craft workers enjoyed positions of privilege, prestige, and power because of their specialized knowledge. With the introduction of interchangeable parts and assembly line production, many employers no longer required highly skilled craft workers. Finally, the number of industrial workers increased dramatically, as the automobile, steel, mining, and oil industries built massive plants and refineries and employed hundreds, even thousands, of workers.

When the AFL failed to organize these unskilled and semi-skilled industrial workers, other organizations stepped into the breach. Where the AFL had restricted its efforts to organizing only highly skilled workers, many of the new unions attempted to organize workers throughout entire industries. One of the early examples of this was the UNITED MINE WORKERS OF AMERICA (UMWA). Led by JOHN MITCHELL, the UMWA attempted to organize mine workers regardless of their job classification within the industry. It was successful in recruiting new members in both bituminous and anthracite coal in the eastern fields and began to recruit in the West. Other unions, such as

the INDUSTRIAL WORKERS OF THE WORLD (IWW), had as their purpose the organization of workers on an industrial basis, regardless of their gender, race, ethnicity, or occupation.

These new unions also differed from the AFL in that they were more progressive and even radical in their politics. Some had strong socialist influences and sought state intervention in labor relations; others looked toward direct action in the workplace as a cure for workers' ills. They were more willing to confront employers to gain recognition or secure their demands. When the UMWA encountered resistance to its attempts to organize the Pennsylvania miners, 140,000 miners walked off the job in the 1902 ANTHRACITE COAL STRIKE, one of the nation's largest. Led by WILLIAM "Big Bill" HAYWOOD, ELIZABETH GURLEY FLYNN, and others, the IWW pursued its goals through work stoppages, general strikes, boycotts, strikes, and other forms of direct action in eastern textile and electrical manufacturing, mid-western agriculture and timber, and at the iron ore deposits of the Mesabi Range in Minnesota and Michigan. Some of the most dramatic demonstrations of the New Unionism were in the SHIRTWAIST MAKERS STRIKE of 1909–10 and the LAWRENCE STRIKE of 1912.

One result of the rise of new unionism was that the labor movement grew in size and strength between 1900 and 1920. Union membership increased from 2 million in 1904 to 5 million in 1920. Throughout the country, workers were organizing unions and demanding pay increases, shorter workdays, and improved working conditions. The burgeoning labor movement also began flexing its political muscle, securing passage of the CLAYTON ANTITRUST ACT (1914) at the federal level and workmen's compensation laws at the state level. Through the INDUSTRIAL RELATIONS COMMISSION, the organized labor movement for the first time played an active role in shaping federal policy on labor relations. Despite the growing influence of the New Unionism, employers continued to resist bitterly the more radical new unions, especially the IWW, preferring to work with the more conservative AFL or to resist with private and state action all labor unions. Between 1914 and 1919, the AFL was the chief beneficiary of the increased power of the labor movement and worked closely with WOODROW WILSON's administration to support the American effort during WORLD WAR I.

The end of the war also brought an end to cooperation between the labor movement and the federal government. It resulted as well in severe repression of the new unionism. Across the country, workers frustrated by pledges not to strike during the war, by low wages, and by rampant inflation, walked off the job in one of the largest waves of strikes in the country's history. The STEEL STRIKE OF 1919, which began on September 22, and lasted until January 8, 1920, involved 365,000 steelworkers and marked the

end of the uneasy labor accord reached during the war. The backlash against the strike wave and the labor movement was swift and widespread. Attorney General A. MITCHELL PALMER was convinced that many of the new unionists were supporters of the RUSSIAN REVOLUTION and were plotting to overthrow the federal government. With the backing of the AFL and many employers, Palmer launched a series of raids against suspected radicals, which became known as the RED SCARE. As one of the chief targets of the Red Scare, the IWW had its offices raided on several occasions. Big Bill Haywood and 165 other IWW leaders were arrested and convicted under the ESPIONAGE ACT of 1917 for hindering the war effort. Similar repression took place throughout the Northwest, where the IWW had been strongest. By the end of 1920, the organization was in total disarray and ceased to be an effective force in the American labor movement.

The demise of New Unionism severely undermined the strength of the labor movement and ensured that it remained in a weakened state throughout the 1920s. New industrial and mixed unions had brought thousands of previously unorganized workers into the labor movement, challenged the supremacy of employers, and criticized conservative state and federal policies toward organized labor. The massive post–World War I strike wave indicated the extent to which new ideas and a willingness to take direct action had taken root among American workers, but the divisions between the new and more radical unions, such as the IWW and the older, more conservative AFL, undermined the effectiveness of the strike wave and helped ensure the demise of the new unionism.

## New Woman

The New Woman is a term that referred to women's more prominent role in the public arena in the late 19th and early 20th centuries. Women's greater visibility manifested itself in colleges, the professions, and reform movements. Economic and social transformations in the mid- to late 19th century contributed to new and different roles for women, particularly women of the upper and middle classes. Social restrictions on middle-class women eased as a market economy changed the dynamics of the household and the relationship of households to the rest of society.

Middle-class white women's lives were shaped not only by circumstances, but also by their changing status. For

one, they chose to have fewer children, a fact that contributed to their growing power within the family and allowed them greater time and flexibility to pursue activities outside of the home. Once the children of married middle-class women were in school, women could devote their energies to a variety of causes. Temperance, social reform, church activism, and the club movement among others provided women with the opportunity to “work” outside the home and in same-sex organizations.

Colleges served as a politicizing and socializing force for the emerging New Woman. As more colleges began accepting women and more women’s colleges were established, opportunities expanded for women. Women’s colleges in particular allowed women to establish their own social networks that eventually served as stepping-stones into the public arena.

Education provided professional opportunities that characterized the New Woman’s elevated status. The New Woman was often a college graduate who worked as a settlement worker, teacher, or librarian. Previously, female jobs such as nursing did not require a college education, but nursing became increasingly professionalized early in the 20th century. Despite these changes, female college graduates still worked in traditional female occupations believed to require women’s innate skills of nurturing and compassion.

Other characteristics of the New Woman included delaying marriage or remaining single. Delaying or avoiding marriage grew more acceptable by society as long as women devoted themselves to a calling deemed socially valuable, such as charitable or reform work. The women’s club movement channeled some of women’s activism in these areas. Beginning in the 1890s, women began forming women’s organizations for the purpose of coordinating volunteers on issues of social concern. Although these groups had precedents, not until the Progressive Era did such activity become widespread. In 1892, there were 100,000 members associated with the newly formed General Federation of Women’s Clubs; by WORLD WAR I, there were over a million. Initially, most women’s clubs engaged in cultural discussions, but many soon adopted a reformist, and even radical, agenda, including advocating for WOMAN SUFFRAGE. Women’s clubs were a reflection of both women’s growing politicization and their political limits. The women’s club movement staked a claim in the public arena using domestic arguments that women needed to extend their sphere to improve society.

Other movements associated with the New Woman made similar arguments. Temperance galvanized hundreds of thousands of women in the late 19th and early 20th centuries. The Women’s Christian Temperance Union was the largest women’s organization of the period. It not only worked to eliminate the evils associated with alcohol, but

Satirizing modern role reversals, a woman wearing knickers and smoking a cigarette observes a man doing laundry. (Library of Congress)

also sought to eradicate ills associated with men, including prostitution and political corruption. As such, it was a political association that located women’s position as moral arbiter in public life. The movement’s foot soldiers tended to be white middle-class women, many of whom later converted to the suffrage cause for many of the same reasons that they initially became involved in temperance.

Suffrage, like temperance and the club movement, drew primarily from a middle-class constituency. Arguing that society’s problems could be remedied by women’s influence, suffragists began agitating in earnest for the vote by the 1890s. The movement reflected the New Woman’s emphasis on female organizations and networks to support reform and women’s entrance into previously male domains. Despite these arguments, suffragists were regularly derided by their foes for allegedly acting against nature in attempting to enter politics. Opponents of women’s education made similar claims that women did not have the mental and physical capacity to engage in learning. Intellectual activity, some male physicians maintained, drained blood from a woman’s reproductive organs. Nativists feared that, if native-born American women were educated, they would have less interest in children, causing immigrant women and children to outpace native-born families. Race suicide, they claimed, was the inevitable result of women’s education.

JANE ADDAMS, who founded Hull-House in Chicago, was the model for this generation of New Woman. She came from a prominent Illinois family and attended college. Later traveling to Europe, she was influenced by the settlement house movement there. Never considering marriage an option, Addams returned to the United States to devote herself to uplifting urban immigrants as well as herself, as she had long been searching for a purpose in life. In her autobiography, *Twenty Years at Hull-House*, she argued that women needed to relinquish “the family claim” on their lives and find “salvation” in attending to social needs.

Addams represented the cross-class activism that many New Women pursued. The NATIONAL WOMEN’S TRADE UNION LEAGUE (NWTUL) embodied the reform spirit of the New Woman in labor struggles. Many female reformers worked with poor urban immigrants who labored in hazardous working conditions. The NWTUL was formed in 1903 as a vehicle for upper- and middle-class women to support working-class women. In one of the most famous strikes of the period, the NWTUL lent its moral, financial, and legal resources to thousands of striking garment workers in 1909, raising awareness of the female immigrants’ plight and forging a cross-class alliance that the male labor movement would not.

The New Woman herself was a bridge between Victorian social mores and modern life. She opened up doors to economic, social, and political advancement through single-sex networks and by using society’s sexual divisions to her advantage. The New Woman was one of the most important constituent groups engaged in Progressive Era reform. After such victories as the Prohibition and suffrage amendments, reform waned in the period after World War I, as did many of the women-based groups that had spearheaded reform. As an image of its time, the New Woman was retired, as “modernity” became the new watchword of the age.

## Niagara Movement

A civil rights organization founded by W. E. B. DuBois in 1905, the Niagara Movement sought to provide a voice for militant action against racial discrimination in the United States. It suffered due to organizational weakness, the opposition of other African-American leaders, and the opposition of whites and disbanded by 1911. The Niagara Movement’s legacy of black militancy lived on in the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP).

DuBois called the first convention at Niagara Falls, Ontario, in the hope of creating a militant voice that would challenge the prevailing racial system in the United States. DuBois and the other founding members disagreed with the teachings of Booker T. Washington, who at the time was the best-recognized leader among African Americans. Repudiating Washington, DuBois and the others believed that African Americans should fight for immediate political and civil rights. Rejecting Washington’s argument that white Americans would accept African Americans once they proved themselves to be upstanding and useful citizens through hard work, DuBois and the others proclaimed that only through immediate and militant action could the African Americans force white Americans to change.

The Declaration of Principles written after the first convention indicated the radical protest that the founders supported. The principles demanded immediate suffrage and civil rights. It protested the “peonage and virtual slavery” that existed in the South. The principles included complaints against the policies of employers in using African-American workers against white workers and against labor union discrimination. They demanded free and compulsory education through high school and the end of discrimination in colleges and trade schools. The Niagara group attacked segregation in churches and streetcars. To right these wrongs, the Niagara Movement urged national education and legislation to secure enforcement of the constitutional amendments guaranteeing equal rights.

The movement never became the force its founders envisioned. Although it gained members in its first two years, it did not establish itself financially and never effectively found its voice. This was due to a number of reasons. First, Booker T. Washington actively discouraged white and conservative African-American donors from supporting the Niagara Movement. Second, its militant tactics repelled some supporters and it faced a severe backlash from its critics. Third, DuBois and the others never made the movement into a mass organization. It remained an organization of the educated elite. Fourth, the leadership continually fought over tactics.

By 1911, the Niagara Movement had collapsed beneath all these pressures. Its legacy lived on in the National Association for the Advancement of Colored People. DuBois and several other Niagara leaders helped found the NAACP and brought to it a dedication to militant, direct agitation in the pursuit of civil rights.

### Non-Partisan League

Founded in 1915 in North Dakota, the Non-Partisan League (NPL) became a leading force in state and regional politics for the next decade and the sponsor of experiments in public ownership and socialist governance. Dedicated to a non-partisan strategy and the Populist tradition of agrarian radicalism, the league sought to create a future of cooperative production within a state-controlled economy that favored small farms and small firms. NPL adherents organized not as a third party but as a political force that could support and influence progressive factions of the two major parties. It backed candidates who supported its progressive program and sought to work as a balance of power in both state and, eventually, national politics.

Situated in a largely rural state, the Non-Partisan League's program promoted an agenda of a "New Day" for North Dakota. It directed its efforts at revitalizing the rural economy and protecting ordinary people from the power of corporations. It flourished in the context of a political culture that provided its members with public education, social and political events, and material symbolism. Under the leadership of league president Arthur C. Townley, Socialist Party organizers and members of the Equity Society, an organization for farm cooperatives, spread the word of the Non-Partisan League. They supported league efforts to take control of the North Dakota state government in 1916. By 1918, the NPL had defeated most of its rivals in new elections and proceeded to enact its program in the state legislature, seeking to establish a state bank to provide rural credit and state-owned grain mills and grain elevators, state-funded crop and farm insurance, workers' compensation, and subsidized housing for workers, as well as greater state regulation of transportation.

Tapping into a regional political culture, the Non-Partisan League spread through the Midwest and the northern plains. As a social movement rooted in rural life with its dependence on the labor of women as well as men, the NPL recruited large numbers of women into its ranks and supported women's right to vote and participate. The league had its greatest success in Minnesota, where a state Non-Partisan League joined farmers and workers in new political efforts and laid the groundwork for the founding of the Farmer-Labor Party in 1922. The league also had influence on the politics in Montana, Idaho, Wisconsin, and Colorado as well as supporters in 13 other states.

Opposition to the league from North Dakota's small urban population, middle-class farmers, and business came together in the Independent Voters' Association, which openly challenged the NPL through investigation of league finances, accusations of corruption, and charges of anti-Americanism. The NPL's opposition to the U.S. entry into WORLD WAR I also cost the league supporters and brought with it government surveillance. Before the war,

many German-American farmers held aloof from the Non-Partisan League, in large part due to its rhetorical support of temperance. Now, however, the NPL's position against the war attracted the support of German-Americans who felt embattled. Their growing support added weight to the charge that the NPL was pro-German and anti-American. By 1919, these charges had eroded league support and cost it political office. By 1925, factionalism within the league, its declining membership, and government prosecution effectively destroyed the NPL as a mass organization. It lingered on as a force in North Dakota politics for another two decades, reviving itself under a more conservative banner in the 1930s. In contrast, its heir, the Farmer-Labor Party of Minnesota, grew to become a major state power in the same decade.

### Northern Securities case (*Northern Securities Co. v. U.S.*) (1904)

A landmark court case in the antitrust movement of the Progressive Era, the Northern Securities case pitted the interests of a newly formed railroad conglomerate against the federal government's authority to regulate and restrict monopoly in national markets. In its 1895 decision in *U.S. v. E.C. Knight*, the Supreme Court held that holding companies, corporations that held a controlling interest of stock in more than one corporation, did not violate antitrust laws. Under this loose interpretation of the Sherman Antitrust Act, industrial and transportation giants such as U.S. STEEL and STANDARD OIL sought to combine the vertical and horizontal functions of industry within a single company, which both created a monopoly within an industry and gave them competitive advantages in the marketplace. Using the form of a holding company, railroad magnate James J. Hill and financier J. P. Morgan sought to form a railroad monopoly. They merged the Great Northern Railroad and the Northern Pacific Railroad into a new corporation known as Northern Securities, with its headquarters in New Jersey. With capital of over \$400 million, Hill and Morgan acquired majority stock in the large railroads and indirectly controlled the smaller Chicago, Burlington and Quincy. Outside observers noted that the stock was about 30 percent water, noting the practice of overvaluing corporate stock. Under the umbrella of the Northern Securities holding company, Hill and Morgan essentially acquired a monopoly in rail transportation in the Pacific Northwest.

Joining the ranks of large American corporations, Northern Securities attracted the attention of trust-busting president THEODORE ROOSEVELT in 1904. Under his administration, the Justice Department filed an antitrust suit against the company, charging it with antitrust violations. In the Supreme Court case, the high court decided against Northern Securities. It found that the creation of the Northern Securities holding company was a clear violation of the Sherman Antitrust Act. The company had created an illegal monopoly that restrained trade and undermined the competitive working of the market. Although Northern Securities' lawyers argued, using the *Knight* precedent, that the Sherman Act did not apply to holding companies, the Court responded that "If Congress had not, by the words used in the Act, described this and like cases, it would, we apprehend, be impossible to find words that would describe them." The company had to disband.

*Northern Securities Co. v. U.S.* was the first successful prosecution of a holding company under the antitrust laws.

After the decision, Roosevelt declared that the Supreme Court had returned to the federal government the power to regulate corporate monopolies and illegal business combinations. He had, however, overstated the case. Although the government's victory put an end to the turn-of-the-century merger movement, holding companies were still in their infancy as a business practice. While they were no longer subject to government regulation, federal antitrust laws had little long-term effect on corporate use of the holding company to form monopolies. The 1911 Standard Oil decision did not alter the environment for big corporations, and trusts such as Amalgamated Copper, American Smelting and Refining, American Sugar, and U.S. Steel continued to thrive. In the 1920s, the use of holding companies spread to the utilities industry, as local utility companies began to form new monopoly enterprises.

### **occupational health and safety**

Occupational health and safety is a broad term that refers to the risks faced by employees in the work environment and the measures taken by employers and the government to protect them from such risks. It is particularly associated with industrial and manufacturing work. In the decades after the Civil War, American industrial development accelerated, aided by the expanding network of railroads, the growth of national markets, and a surge in immigration from southern and eastern Europe. The rapid industrial growth of the United States exacted a heavy toll on workers. In the first decade of the 20th century, concern about the risks of industrial work became particularly acute. Workers increasingly developed serious illnesses and diseases as a direct result of their jobs, while dangerous industrial processes began to exact a heavy toll in injuries and deaths, especially in the key industries of coal mining and steel manufacture.

The number of people who lost their lives on the job cannot be determined, largely because employers did not keep accurate records and state governments did not have a uniform system of documenting workplace fatalities. Contemporary estimates reflected just how dangerous the workplace was in the early 20th century. According to a bulletin published in the labor press in 1904, about 27,000 workers died in the workplace each year. Three years later, the Bureau of Labor estimated that the annual occupational death toll in the United States was between 15,000 and 17,000, from a total of 26 million male workers. The bureau's more conservative estimate demonstrates that establishing accurate figures for the workplace fatality rate is problematic. It also shows that the federal government often placed the interests of large corporations ahead of workers.

The federal government did enact measures to regulate conditions in the workplace, although the success of such measures is questionable. In 1910, for example, CONGRESS created the Bureau of Mines in response to the esca-

lating number of disasters in the nation's mining industry. The most prominent of these disasters was an explosion at a coal mine in Monongah, West Virginia, in 1907, which had killed 362 miners. The government placed the bureau in the Department of the Interior. While the Bureau of Mines had the capacity to carry out mine inspections and make safety recommendations to mining companies, it did not have the power to enforce its recommendations. Its capacity to improve safety conditions in the mines was limited by the fact that it also was responsible for promoting the interests of the mining industry.

In the early years of the 20th century, the federal government sought to enforce workplace health and safety through the U.S. Public Health Service (USPHS). It broadened the mandate of the USPHS, founded in 1798 as a network of hospitals for ill and injured seamen, to include the provision of health care for victims of natural and industrial disasters and research into industrial hazards. Because the USPHS depended largely on donations from industry for its survival, it became captive to the interests of industry. This was particularly evident in the AUTOMOBILE INDUSTRY, where workers regularly came into contact with lead and other hazardous substances. Lead poisoning first became evident in 1919, as General Motors and other corporations started to experiment with tetraethyl lead in the search of an efficient leaded fuel. Their early efforts often had fatal consequences. In one experiment in 1924, 11 workers died and several more became severely ill. Despite the obvious connection between tetraethyl lead and the workers' deaths, the USPHS sided with the corporations that were conducting the experiments.

State governments implemented their own solutions to deal with the occupational health and safety crisis. Most passed their own WORKERS' COMPENSATION laws between 1911 and 1921. Employers responded to the problem somewhat differently. In an effort to reduce the workplace accident rate, reform-minded businessmen created the National Safety Council in 1913. In the

early 1920s, the occupational health and safety movement shifted focus. Employers rejected the idea that they should bear full responsibility for the enforcement of safe working conditions and stressed that workers had a role to play. They frequently adopted the argument that most workplace accidents were the result of workers' carelessness or lack of attention, not faulty machinery or inefficient workplace regulation. Moreover, they abandoned the issues of industrial disease and workers' long-term health and instead focused solely on immediate safety issues. Finally, they employed professionals, experts, and scientists who would strictly control efforts to reform health and safety legislation.

In the 1920s, many workers were not careless about their work but simply ignorant about the risks it posed, and this limited efforts at reform. The Workers' Health Bureau of America, which existed from 1921 to 1928, sought to rectify this problem. The bureau encouraged workers and unions to play a greater role in workplace health and safety and sought to sever the ties that bound scientists and engineers with industry, asserting that such professionals should prioritize the interests of labor. Organizers in the bureau had lost faith in the willingness of government and public agencies to address occupational hazards and felt that such hazards would be better managed by labor unions. Harriet Silverman was one of the most prominent figures in the bureau, driven by her conviction that workers rarely received the support they deserved from employers and the judicial system. Although the bureau attracted the support of most of the country's major unions, it declined in the mid-1920s and eventually disbanded in 1927.

Despite the growing emphasis on occupational health and safety in the first three decades of the 20th century, industrial workers failed to gain adequate legislative protection that eradicated, or at least reduced, the risks they faced.

## oil industry

The oil industry in the United States expanded rapidly between 1900 and 1930 as it tried to keep pace with the nation's energy demands. In particular, the expansion of industrial production and the widespread ownership of automobiles resulted in an insatiable demand for oil and gasoline. An important part of the nation's industrial development in the 1860s and 1870s, oil was first drilled in the United States in 1859 in Titusville, Pennsylvania. Initially, the oil refining industry was centered in three locations—Cleveland, Pittsburgh, and Philadelphia—and characterized by numerous small competitors. The crude oil was pumped from wells, chemically refined into kerosene, and then used primarily in the growing illumination industry. In 1867, JOHN D. ROCKEFELLER formed the STANDARD OIL Company and quickly began to dominate the industry. Rockefeller was determined to control every aspect of the industry including drilling, refining, transportation, sales, and distribution. As Standard Oil grew larger, Rockefeller used the company's power and wealth to buy out competitors and secure preferential transportation rates from the railroads. In 1872 Standard Oil controlled 10 percent of the industry. A decade later, the company controlled 90 percent. In 1882, Rockefeller combined all of the companies he had purchased to form the Standard Oil Trust. Less than a decade later, Rockefeller had expanded his oil empire to include ownership of oil wells, railroads, refineries, and distribution facilities throughout the country and could set oil prices at whatever level he desired.

By 1900, Standard Oil dominated the oil industry as one of the most powerful companies in the country. The way in which Rockefeller controlled the industry, determined prices, and eliminated competition worried muckraking journalists and progressive reformers. In 1904, *McClure's Magazine* published a series of articles by IDA TARBELL that exposed the way in which Rockefeller built his oil empire and the ruthless way in which he maintained it. Collectively published in 1904 as *The History of Standard Oil*, the articles helped convince the federal government to investigate possible antitrust violations. President Theodore Roosevelt had promised to enforce the Sherman Antitrust Act of 1890 and take an aggressive stand against illegal trusts and monopolies. In 1906, Roosevelt, claiming Standard Oil was 20 times larger than its nearest competitor, instructed the federal government to take action against the corporation. The case wasn't resolved until 1911 when the Supreme Court ruled that the company had in fact violated federal antitrust laws and ordered that, in order to spur competition, the company be broken into smaller, independent parts.

Between 1900 and 1930, oil became more and more profitable. As it did, oil companies began investing vast sums of money in exploration and development. No

Oklahoma well strikes oil. (Library of Congress)

longer able to meet demand by finding oil reserves that had seeped to the earth's surface, companies began drilling deep underground. Oil companies hired university-trained scientists and geologists to analyze soil samples and rock formations in order to predict the location of new underground reserves. When a huge underground "gusher" was discovered in Beaumont, Texas, in 1901, it started an oil boom that lasted until the onset of the Great Depression. The new crude oil discovered in California and on the Gulf Coast of Texas yielded extremely high levels of fuel oil. After the discovery of the Beaumont gusher, the center of the domestic oil industry shifted to Texas.

Demand for oil was at an all-time high as industrial production increased. Factories, which had once been little more than small workshops, grew in size and complexity. The Ford Highland Park auto plant, for example, opened in 1910 and by 1917 employed 36,000 auto workers. The plant was highly automated, and it used massive amounts of gasoline and oil. The spread of the assembly line and mass production resulted in a corresponding growth in the

oil industry. By 1919, gasoline had become the oil industry's best-selling product, accounting for approximately 45 percent of all sales. Technological innovations increased the purity of the gasoline produced. In 1914, Standard Oil of Indiana developed a "cracking" process that yielded a higher-octane gasoline. By eliminating impurities, automobile manufacturers were able to develop more powerful and efficient engines.

For a period of time, the Supreme Court's decision to break up Standard Oil had the desired impact. Even before the Court's ruling, it had become clear that the company's domination of the industry had begun to wane. Several new competitors entered the field before 1911, including Texaco (1902), Shell (1907), and British Petroleum (1909). By the time it was dissolved, Standard Oil controlled only 65 percent of the industry. The Supreme Court ruling against Standard Oil broke the giant into 34 smaller companies. Eventually, however, several large corporations dominated the industry. Known as the Seven Sisters, Esso (So = Standard Oil), Shell, Amoco, Chevron, Atlantic Richfield, British Petroleum, and Texaco extended their control over all aspects of the industry, both in the United States and around the world.

While industrial expansion helped spur the growth of the oil industry, it was the development of widespread automobile ownership that made the industry one of the wealthiest and most important in the country. In 1900, there were fewer than 2,500 registered automobiles. By 1929, the number had jumped to a staggering 26.7 million. Throughout the country, the local filling station became as common and as essential as the local bank.

The impact the oil industry had on the nation between 1900 and 1930 is impossible to overstate. ELECTRICITY, a rarity prior to 1900, also had become commonplace in most cities and spread rapidly to rural areas as well. By 1930, the country had become completely dependent upon gasoline and electricity. Homes were lighted and heated by gas and electricity. Food was stored and prepared using gas and electricity. In fact, by 1930, oil companies in the United States were producing over 3 million barrels of oil per day, and every aspect of daily life and the health of the American economy had become dependent upon oil.

### Open Door Policy (1899, 1900)

As a summary of American foreign policy toward Asia, the Open Door policy was first articulated at the turn of

the century in a bid for greater access to Asian economic markets. American interest in protecting these markets increased after the United States took control of the Philippines in the war with Spain in 1898. Government officials feared that they would be cut out of plans by the European imperialist powers to carve up China for themselves. By 1900, England, France, Germany, Russia, and Japan had already taken territory in China. In response, the United States hoped to persuade the major powers through diplomacy to maintain the territorial status quo and thus keep open economic access to Asia.

President William McKinley issued a statement in September 1898 stating that the United States wanted to protect the political and administrative integrity of China as well as have access to the country: "Asking only the open door for themselves, we are ready to accord the open door to others." In 1899, Secretary of State John Hay sent out a similar message, which was later called the "Open Door notes," to the major powers in Europe and Japan. In the messages, Hay asked England, Germany, Russia, France, Japan, and Italy to abide by three principles. First, he asked that each nation with a sphere of influence in China respect the rights of other nations in its sphere. Second, he asked that Chinese officials continue to collect tariff duties in all the spheres. Third, he asked for nondiscrimination by nations in levying port dues and railroad rates against other nations. U.S. officials hoped that the principles would protect free trade in China. In addition, they wanted to prevent the formal partition of China by European powers while avoiding military involvement.

Europe and Japan reacted coolly to the Open Door proposals, noting that they would be unable to act unless all the other powers agreed as well. Despite the weak reception to the Open Door policy, Hay announced that all major powers had accepted the American principles. In practice, any nation could violate the Open Door, unless the United States was willing to go to war over the policy.

Almost immediately the Open Door was tested by a revolt that broke out in China. In the BOXER REBELLION, nationalists laid siege to the entire foreign diplomatic corps, most of whom had retreated to the British embassy in Beijing. As a result the imperial powers, including the United States, sent an international expeditionary force into China to rescue the diplomats. The international force broke the siege in August 1900.

President McKinley ordered the military to participate in the expeditionary force so that the United States could prevent the partition of China by Japan and the European powers. After the Boxer Rebellion, England and Germany agreed to abide by the Open Door Policy. In addition, Hay persuaded the major powers to agree to China compensating them for damages accrued during the

rebellion. At least in theory, the United States achieved its goals of maintaining access to free trade and of protecting the sovereignty of China. In practice, the United States was unable to prevent the country's dismemberment by European countries, because the United States was ultimately unwilling to use military force against the major powers to protect China.

During the Boxer Rebellion, Russia had positioned 175,000 troops in Manchuria, a province of China over which Russia and Japan vied for control. It demanded exclusive rights and a commercial monopoly in China. President THEODORE ROOSEVELT and Hay, unable to stop Russian encroachment on Chinese sovereignty, stated that they recognized the privileged role of Russia in the region but that the administration wanted to preserve the commercial freedom of the United States. Roosevelt backed down from the Open Door Policy of 1900, because he thought that Americans were not willing to fight in a remote area of Asia for the abstract idea of Chinese sovereignty in Manchuria. According to historian Akira Iriye, Roosevelt realized the futility of trying "to play the role of an Asian power without military power."

In 1904, Japan attacked the Russian fleet at Port Arthur in Manchuria. In 1905, President Roosevelt agreed to mediate the RUSSO-JAPANESE WAR that had broken out as a result. At a peace conference, Roosevelt reached an agreement between the powers. The Russians agreed to recognize Japanese territorial gains in exchange for the Japanese agreeing to cease their fighting and expansion. Roosevelt also reached a secret agreement with the Japanese, ensuring that the United States could continue its free trade in the region. With the Russian fleet destroyed at Port Arthur, however, Japan became the dominant naval power in the Pacific, and began excluding American trade from the territories it controlled.

In the end, the United States persuaded some of the European powers to enforce the Open Door. Having intervened in the affairs of nations outside the Western Hemisphere, the Open Door policy was symbolic of the rise of the United States as a world military power early in the 20th century. Yet, both the war with Spain and the relative ineffectiveness of its diplomacy in the Open Door notes revealed the inadequacy of the American military. The experience of expansion spurred national reforms to build a modern military system in the United States.

### open shop movement

The open shop movement was an attempt on the part of corporations, trade associations, chambers of commerce, and their political supporters to weaken the organized labor movement by requiring employees to work in an open or nonunion workplace. Gains in labor union membership in the early 20th century prompted sharp responses from employers and businessmen, and antiunion organizations such as the NATIONAL ASSOCIATION OF MANUFACTURERS (NAM) and the American Anti-Boycott Association organized campaigns at both the local and national level aimed against strikes, boycotts, and political action among workers. Although the majority of employers had long opposed labor unions and resisted the closed or union shop (whereby workers were required to join the union as a condition of their employment), the open shop movement began in earnest in response to the wave of labor unrest that followed WORLD WAR I.

The labor movement gained strength between 1900 and 1918. Union membership increased from 2 million in 1904 to 5 million in 1920. As the power of the labor movement increased, unions began demanding closed or union shops. The main advantage of the closed shop was that unions did not have to continually recruit new employees in order to maintain their presence. Most employers resisted any form of organized labor, and they especially opposed the closed shop. The wave of labor unrest that followed the end of the war, most notably the massive STEEL STRIKE OF 1919, convinced business leaders of the need to fight labor with a united front.

At a 1919 meeting on industrial relations called by President WOODROW WILSON, business leaders such as Henry Clay Frick, Judge Elbert Gary, and JOHN D. ROCKEFELLER, Jr., came up with a plan to roll back the gains

made by organized labor. Dubbed the AMERICAN PLAN, it encouraged employers not to negotiate with labor unions and launched a campaign to convince the American public that the closed shop and the labor movement in general were “un-American.” Tapping into the patriotism unleashed during the war, backers of the open shop movement insisted that, because employees were required to become union members, the closed shop was unfair and undemocratic. NAM president John Edgerton stated “I can’t conceive of any principle that is more purely American . . . than the open shop principle.”

By 1920, a network of open shop organizations had spread throughout the country and the labor movement was on the defensive. Although the open shop movement was couched in patriotic terms, in reality it was little more than a concerted effort to roll back many of the wartime gains made by organized labor. Many employers who publicly championed the open shop as a workplace that welcomed both union and nonunion employees were bitterly opposed to any union presence. U.S. STEEL, for example, had endured a five-month-long strike in 1919 rather than negotiate a contract with the National Committee for Organizing Iron and Steel Workers. Throughout the strike and even after, its president insisted that he would close every steel mill he owned before he agreed to a union contract. When combined with the RED SCARE, the open shop movement had a devastating impact on the labor movement. By 1929 union membership had fallen to 3.5 million.

## **Palmer, Alexander Mitchell** (1872–1936) *attorney general*

A. Mitchell Palmer was the attorney general who spearheaded the post–WORLD WAR I raids against suspected socialists, communists, radicals, and others who had opposed American entry into the war. Born in Moosehead, Pennsylvania, in 1872, Palmer was brought up in a strict Quaker family. After attending Swarthmore College, he joined the Pennsylvania Bar in 1893 and became involved in Democratic Party politics. He used his legal and political connections to launch his own political career. He was elected to the House of Representatives in 1909 and held his seat until 1915. As a member of the House, Palmer was an early supporter of WOODROW WILSON's presidential campaign in 1912, but his political career suffered a serious setback in 1916 when he was defeated in his bid to win a seat in the Senate.

During the time he spent in Congress, Palmer was closely identified with the progressive wing of the DEMOCRATIC PARTY and earned a reputation as a defender of woman suffrage and labor unions. His political career was revived in 1919 when Woodrow Wilson, rewarding Palmer's long-standing support, nominated him to become attorney general. American involvement in World War I had caused a serious rift among progressives, socialists, and pacifists, between those who supported American entry into the war and those who opposed it. Concerned about the public's long-standing isolationism, the Wilson administration was determined to rally public support for the war effort. Key components of its efforts to ensure public support were an all-out public relations campaign, spearheaded by the COMMITTEE FOR PUBLIC INFORMATION, and the silencing of antiwar critics, best exemplified by the passage of the ESPIONAGE ACT (1917) and the SEDITION ACT (1918). The fact that some progressives supported U.S. entry into World War I made it easier for the administration to crack down on those who dissented.

Even though the war ended in November 1918, the outbreak of the RUSSIAN REVOLUTION had convinced many in the government of the need for even greater vigilance and suppression of political dissent.

By the time Palmer became attorney general, he was convinced that the Bolsheviks were intent upon launching a worldwide revolution and overthrowing the American government. In response, Mitchell hired J. Edgar Hoover as his special assistant. The Justice Department used the Espionage and Sedition acts to silence radical and left-wing dissent. Nevertheless, political and labor unrest escalated after the war. By the fall of 1919, Palmer was convinced that domestic and international communists and anarchists were determined to overthrow the American government. In response, on November 7, 1919, he authorized the arrest of more than 10,000 suspected communists, radicals, anarchists, immigrants, and dissidents. Many of those arrested during the first Palmer Raid were detained for days without a trial. A second raid took place in January 1920, with the INDUSTRIAL WORKERS OF THE WORLD (IWW) as its main focus. Although most of those arrested in the Palmer raids were eventually released and no charges filed, several hundred were ultimately deported from the country.

By early 1920, when it became clear that no revolution or uprising had ever been in the works, public opinion turned sharply against Palmer and the Wilson administration. The Palmer Raids and the RED SCARE of 1919–21 not only devastated the already weakened labor movement but also established a long-standing tradition of hostility and paranoia toward the political left.

### Panama Canal

The United States built the PANAMA CANAL, a channel 50 miles in length, to cut through the Central American nation of Panama and link the Atlantic and Pacific Oceans. The construction of the canal reinforced the rise of U.S. naval power and economic dominance in the Western Hemisphere, fulfilling a long-held dream to create a route that allowed ships to move freely between the two oceans.

The Clayton-Bulwer Treaty of 1850 had already provided for the joint construction of any Central American canal by Britain and the United States. By the turn of the century, the United States wanted sole control over the canal zone. After its victory over Spain, President William McKinley came to an agreement with Britain in February 1900. The Hay-Pauncefote Treaty allowed the United States to build a canal on its own but did not permit its fortification.

The hero of the Spanish-American War of 1898, THEODORE ROOSEVELT, opposed the treaty, because it forbade the United States from fortifying the canal. He led a cam-

paign that defeated the Hay-Pauncefote Treaty in the Senate. On November 18, 1901, Hay and Pauncefote signed a treaty that Roosevelt, who had become president of the United States after William McKinley's assassination, found acceptable.

At the same time, a two-year investigation under the Walker Isthmian Canal Commission found that Nicaragua would be a more suitable route for the canal. The report found that purchasing the rights for a route through Panama would be too expensive. A French-chartered firm, the New Panama Canal Company, which held the canal rights, estimated its assets on the Panamanian isthmus at \$109 million. Following the recommendations of the Walker Commission, the U.S. House of Representatives passed the Hepburn Bill on January 8, 1902, authorizing a canal through Nicaragua.

Lawyers representing the New Panama Canal Company waged an intense lobbying effort in Washington, D.C. The Walker Commission estimated the value of the New Panama Canal Company at \$40 million. In addition, the

The Panama Canal under construction (Library of Congress)

Walker Commission, noting that the company was willing to sell the rights to the canal at the lower price, reversed itself on January 18, 1902, to favor the canal route through Panama. Five months later, Congress passed the Spooner Act, which authorized the route in Panama. On January 22, 1903, Secretary Hay and Colombian chargé d'affaires, Tomas Herrán, signed a treaty that provided Columbia with an initial payment of \$10 million and \$250,000 annually. In return, the United States gained control over the canal zone for 100 years, an option renewable in the future only by the United States.

Although Colombia wanted the United States to construct the canal, a costly civil war created an urgent need for funds. The Colombian government tried to exact \$10 million from the New Panama Canal Company as a payment for transferring its assets to the U.S. government. In addition, the Bogotá government attempted to get a higher initial payment of \$15 million from the United States. President Roosevelt refused to make the higher payments. In addition, the Colombian senate balked at the American encroachment on Colombia's sovereignty over Panama. The Colombian senate unanimously rejected the treaty on August 12, 1903.

When Colombia's rejection of the treaty seemed imminent, Roosevelt considered either taking Panama by force or providing any revolutionary regime in Panama with immediate recognition and support. With an uprising appearing likely, Roosevelt chose the second option. On October 16, 1903, Secretary Hay informed Philippe Bunau-Varilla, a Frenchman who had fought for a Panamanian canal and agitated for Panamanian independence from Colombia, that the United States was sending warships to the isthmus.

Bunau-Varilla notified the revolutionaries when the American ships would be arriving. On November 2, the USS *Nashville* reached Colón. Acting Secretary of State Francis B. Loomis had ordered the commanding officer of the *Nashville* to "make every effort to prevent [Colombian] Government troops at Colon from proceeding to Panama." However, the transmission to the *Nashville* had been delayed, and the commander of the *Nashville* did not interfere with the landing of Colombian troops. The revolutionaries, forced to fend for themselves, successfully took control of Panama and formed a provisional government.

On November 18, 1903, less than two weeks after the U.S. administration recognized the new government of Panama, the two countries signed the Hay-Bunau-Varilla Treaty, which permitted the United States government to construct, fortify, and run a canal connecting the Atlantic and Pacific Oceans. Upon the urging of Roosevelt, the Congress quickly ratified the Hay-Bunau-Varilla Treaty. Construction of the canal began in 1904.

In 1911, former president Roosevelt was widely reported as saying, "I took the Canal Zone and let Congress debate; and while the debate goes on the Canal does also." After a decade of construction, the Panama Canal opened to traffic on August 15, 1914. In 1922, the United States paid \$25 million to Colombia for the canal zone. Vital to the strategic and economic interests of the United States in the Western Hemisphere, the Panama Canal Zone allowed for the free movement of shipping between the Atlantic and Pacific Oceans. The U.S. presence at the Panama Canal was symbolic of the rise of American economic and military power in the region.

## Pan-American Exposition

The Pan-American Exposition, the United States's third international exposition, opened in Buffalo, New York, in May 1901 and ran until November. The City of Buffalo hoped that the gathering would achieve success similar to that of the Philadelphia Centennial Exposition of 1876 and the World's Columbian Exposition of 1893 in Chicago. Both of these previous expositions elevated the prestige of the nation in the world. Like America's previous international exhibitions, the Pan-American Exposition showcased the nation's progress and a utopian view of its industrial and commercial future. Some items on display for the first time were the X-ray machine, an infant incubator, and electric lighting. Buffalo hoped that the Pan-Am would be an economic boon for the region and bring recognition to Buffalo as a modern industrial city.

The construction and architecture of the Pan-Am reflected an attempt to break from past expositions and show the progress and promise of the 20th century. In stark contrast to the iron, brick, and glass buildings of the Centennial Exposition and the neoclassical White City of the Columbian Exposition, the Pan-Am buildings were constructed in a Spanish Renaissance style and painted in a multitude of colors. The buildings of the Rainbow City, designed by Charles Yardley Turner, were painted in colors that began with deep dark hues and progressed toward lighter pastels and grays as they reached the Electric Tower, the visual and technological focal point of the exposition. The use of hydroelectric power to light the buildings, the grounds, and the Electric Tower created an unprecedented display of modern technology.

Building in the Pan-American Exposition lit up by electric current, 1901 (*Library of Congress*)

The use of color and sculptures and the arrangement of the landscaping reflected a theme of naturalism, but the grounds of the Pan-Am also were intended to symbolize the perceived racial hierarchy among the nations of the world. The grounds were designed to reflect and express a racial view of the evolution of humankind toward modern western civilization. The placement of the lighter colored buildings adjacent to the Electric Tower was intended to suggest that the lighter races, especially the white race, had been most responsible for the advances of modern civilization and human progress.

The events and displays at the Pan-Am also presented a link between race and progress. There were reenactments of the armed battles between the U.S. Cavalry and Native Americans that portrayed them as uncivilized savages. The Ethnology Building was painted gold, considered a primitive color. It contained artifacts that were arranged in ascending order, illustrating the rise of human beings from primitive to modern. Several village displays were set up throughout the grounds. The Mexican, African, and

Japanese villages were built to suggest the primitive state of their cultures when compared to the main buildings such as the Temple of Music, the Government Building, the Machinery and Transportation Building, and the Electricity Building. The Filipino Village was constructed from the perspective of the American empire, suggesting the role its newly acquired colony would play as American influence spread throughout the globe.

The Pan-Am, like the previous expositions, was shaped by contemporary political issues and events. The Spanish-style architecture was intended as a statement of America's hemispheric solidarity with the nations of Latin America and as a celebration of its new role as a world power. After the Spanish-American War, many business and government leaders viewed the entire Western Hemisphere as America's legitimate economic and political sphere of influence. Emboldened by its successful defeat of Spain and its possessions in the South Pacific and the Caribbean, the United States directly intervened in Central and Latin American countries. In its design, the Pan-Am Exposition celebrated the new imperial role of the United States.

The Rainbow City, the display of electric lights, and the theatrical presentation of racial hierarchies were overshadowed when on September 6th, during his visit to the exposition, President WILLIAM MCKINLEY (see Volume VI) was fatally shot by anarchist Leon Czolgosz. Vice President THEODORE ROOSEVELT took office after McKinley's death. Because of the Pan-Am's focus on race and the advent of the progressive Roosevelt presidency, the Pan-American Exposition has been seen as a moment of transition for the United States from the Gilded Age to the Progressive Era.

### Passaic Strike (1926)

The economic recession after WORLD WAR I, the loss of massive postwar strikes, and the RED SCARE took a severe toll on the labor movement. In the following decade, labor unions suffered steep declines in membership, particularly in the ailing textile and mining industries. By the mid-1920s, however, these industries began to recover from the postwar crisis and witness the stirrings of worker protest that included the Passaic strike of 1926. As cotton and woolen textile manufacturing increased, so too did the willingness

of workers to demand their due. The wage cuts, mandatory overtime, bad working conditions, and increasing workloads that had followed the war set the stage for strikes in textile factories in the Northeast and the South.

During these years, craft unions continued to dominate the labor movement. They had little incentive to organize industrial workers. New initiatives from within the COMMUNIST PARTY gave priority to organizing mass industry. Its work in the textile industry played a crucial role in organizing drives in the woolen industry in Passaic, New Jersey. Workers in the woolen mills in Passaic and surrounding towns were first and second generation ethnics, many of them women. Like the workers in the LAWRENCE STRIKE of 1912, they spoke a wide array of languages, including Polish, German, Hungarian, Russian, and Italian. These differences kept them divided. Their employers had sharply cut wages and frequently laid off workers during the early 1920s. Recovery brought the hope that workers would no longer be asked to accept deteriorating conditions.

On January 25, 1926, 6,000 workers struck the Botany Woolen Mill in Passaic. The strike quickly spread to mills in Garfield, Clifton, and Lodi. Within a few weeks, over 20,000 woolen workers were on strike. The strikers demanded that their employers rescind a 10 percent wage cut, limit hours to 44 per week, and improve working conditions. They also asked that the union be recognized. The Passaic City Council passed an ordinance to prohibit workers from picketing, but strikers continued to protest outside the plants. There were many arrests. The strike attracted national publicity and the support of liberal and left-wing organizations, and the relief committee raised over \$500,000 to aid strikers.

By summer, however, the long strike was beginning to take its toll. The Communist Party decided to turn control of the strike over to the United Textile Workers (UTW), an AFL union. The UTW took over the direction of the strike on the condition that Communist labor organizer Albert Weisbord leave his leadership position. Once he withdrew, the strike began to fall apart. Relief funds slowed, and the UTW began to negotiate with employers. In late 1926 and early 1927, some of the mills came to terms with the strikers. The wage cut was stopped, but workers failed to gain union recognition. That failure left them, and the organized labor movement, without recourse to collective bargaining in the textile industry.

The Passaic Strike foreshadowed organizing drives in the textile industry between 1928 and 1932, especially the GASTONIA STRIKE. The conservatism of the labor movement and the resistance of craft unions to industrial unionism meant that workers in mass production industry failed to establish stable unions during this crucial decade.

### Paterson Strike (1913)

A crucial test of the strength and durability of the early industrial unionization movement, the Paterson Strike led to the decline of industrial unionization as a strategy and weakened the INDUSTRIAL WORKERS OF THE WORLD (IWW). From February 25 to mid-July of 1913, nearly 25,000 silk workers joined in a general strike in Paterson, New Jersey. By the time all the workers trickled back into the silk mills in July, the strikers had largely failed to achieve their goals. In addition, the failure led many workers to question the efficacy of industrial unionization and the leadership of the IWW.

After their victory the previous year in the LAWRENCE STRIKE, the IWW had won a number of other small victories. This led them to believe that they were building the future of unionism in the United States. The IWW's textile union had gained members since the Lawrence strike and had become more popular among textile workers in Paterson than the craft-based Union of Textile Workers, which was affiliated with the AMERICAN FEDERATION OF LABOR. When in February 1913, weavers in one mill went on strike over the number of looms they were required to work, the IWW took action to expand the strike to all mills in Paterson. They did this because one mill owner would not be willing to give in to the union's demands if its competitors had not. In making the strike a general strike, the IWW avoided making specific demands. It feared that a strike based on a set of specific demands might not appeal to all workers. Instead, the IWW called for a general strike to protest working conditions throughout the Paterson silk industry.

The IWW used many of the same tactics that it had used successfully in Lawrence but did not achieve the same results. It again called in its best-known leaders, WILLIAM ("Big Bill") HAYWOOD and ELIZABETH GURLEY FLYNN, who organized a central strike committee made up of members of all the local unions. The IWW also tried to gain sympathy by evacuating the children of strikers, claiming that their lives were in danger because of the hardships faced by the striking workers. The town authorities and mill owners successfully counteracted the IWW's actions by remaining calm. They did not use the police to harass strikers to the extent that their counterparts in Lawrence had. Most importantly, they ignored the evacuation of the children. Without a violent reaction from the authorities, the evacuation gained the strikers little sympathy from outside observers. The mill owners thus won the propaganda war.

In what became a controversy, the strike leaders attempted to win the propaganda battle by producing a play to publicize the plight of the silk workers. Performed in New York City's Madison Square Garden, the play attracted a large audience but ultimately contributed to the failure of the strike. Financially, the play was a failure. Promoted to the strikers as both a publicity stunt and a money raiser, the play raised just a few hundred dollars. There were many accusations that IWW leaders embezzled funds. Although no credible evidence was produced to support the charges, the efforts to produce the play diverted energy from the situation in Paterson. Subsequently, many of the striking workers felt that the IWW leaders were too preoccupied with the play to effectively lead the strike.

Ultimately, the strike failed due to divisions among the workers who held a variety of jobs and had, therefore, differing demands. General demands for improvements in working conditions were not enough to hold the strikers together. The strike effectively ended the IWW's influence in the eastern United States and seriously damaged the industrial union movement.

### **Paul, Alice** (1885–1977) *suffragist*

Born on January 11, 1885, into a Quaker family in Moorestown, New Jersey, Alice Paul became one of the most formidable voices in the movement for a federal woman suffrage amendment. Paul attended Swarthmore College and the New York School of Social Work. She relocated to Britain, where she continued her studies and became involved in that country's suffrage movement. It was there that Paul developed an appreciation for militant protest techniques such as civil disobedience and hunger strikes. Such tactics would catapult her into the national spotlight and bring her into conflict with other suffragists when she returned to the United States.

Alice Paul became involved with the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION (NAWSA) in 1912. Earning a reputation as a tireless and demanding activist, Paul organized teams of women from around the country to lobby representatives in Washington, D.C. In March 1913, she organized an 8,000-strong suffrage parade, timed to coincide with President WOODROW WILSON's first inauguration, in the nation's capital.

Paul's tenure at NAWSA was short-lived, as her tactics were seen as too radical and counterproductive. She

did not defer to male politicians. Her single-minded focus on a federal amendment, furthermore, was at odds with NAWSA's combined state and federal approaches to woman suffrage.

In 1916, Paul and other radical suffragists formed the NATIONAL WOMAN'S PARTY (NWP) to fight for a federal suffrage amendment. The NWP targeted Wilson and his party by picketing the White House daily after January 1917 and campaigning against anti-suffrage politicians. NWP activists also appealed to women in enfranchised states to vote against the party in power, the Democratic Party, to hold them responsible for the failure to pass woman suffrage. The pickets, called Silent Sentinels, garnered national attention as women of all ages protested, regardless of weather conditions. The picketers were treated inconsistently but sometimes violently by authorities. Alice Paul herself went on a hunger strike while in custody, prompting officials to force-feed her for two weeks.

The efforts of Alice Paul and other suffragists finally paid off as Wilson realized that not only could the suffragists no longer be ignored, but also woman voters, he learned, might actually benefit his party. Wilson publicly supported woman suffrage in 1918. The House of Representatives passed the Woman Suffrage Amendment that same year and the Senate in 1919. The Nineteenth Amendment was ratified in 1920.

After the ratification of the Nineteenth Amendment, Alice Paul concentrated on presenting an EQUAL RIGHTS AMENDMENT (ERA) to Congress, which she did in 1923. After conflicts with other female activists over the ERA, Paul began work on women's issues at the international level. She cofounded the World Party for Equal Rights for Women, also known as the World Women's Party, to pressure governments to expand women's rights through international organizations such as the LEAGUE OF NATIONS and its successor, the United Nations. In the United States, she continued to be associated with the NWP and the struggle for an ERA after World War II. Alice Paul died in 1977 in her hometown, Moorestown, New Jersey.

Despite her impressive legacy in the fight for female suffrage and the ERA, Alice Paul was not without controversy. Like many white suffragists active in the Progressive Era, Paul was less willing to fight for the rights of African-American women. After the ratification of the Nineteenth Amendment, she still did not think the time was appropriate to support black female voting rights. Her support for an Equal Rights Amendment, while farsighted, caused a rift in the women's rights movement. Her dependence on contributions to support the struggle kept her from reaching out to women across class barriers. Despite these shortcomings, Paul is remembered as a primary mover for women's rights.

### Payne-Aldrich Tariff Act (1909)

The increased duties of the Payne-Aldrich Tariff Act marked a shift in the policies of President WILLIAM HOWARD TAFT from progressive reform toward a more conservative, business-oriented politics. Upon leaving the office of president, THEODORE ROOSEVELT had charged Taft, his chosen successor, with continuing the progressive reform agenda that he had initiated during his two terms as president. When Taft entered office in 1909, he continued many of the progressive reforms that his predecessor had established, but he was not entirely comfortable in the role of reformer. A natural conservative, Taft sanctified private property and revered the process of the law. Still, President Taft was aggressive in attempting to deflate in one term the power held by trusts that Roosevelt had attempted in his two terms as president.

By 1909 the REPUBLICAN PARTY was torn on how to respond to the demands of the Progressive movement. While the movement lacked a coherent, unifying element, it tended to speak for the need to better regulate and control the economic power held by the corporate elite. Progressives considered protective tariffs a major factor in the consolidation of economic power that had contributed to the decline of competition in the American marketplace. Instead of protective tariffs, which often closed the American market to less-expensive imported products, Progressives argued for a revenue tariff that would allow the federal government to generate needed revenues but that did not entirely close the American market to foreign products. Despite advocating a progressive agenda during his presidential campaign, President Taft annoyed many Progressives when he signed the Payne-Aldrich Tariff in 1909.

When he entered office, Taft had favored lowering tariffs on a broad range of commodities. In a relatively short amount of time, the House passed a bill that lowered the tariff on a number of products and goods, but the Senate took a different position from the House. The chair of the Senate Finance Committee, Nelson W. Aldrich, guided through the Senate a bill that drastically revised and enlarged the tariff on more than 800 items. The tariff created an acrimonious debate in the Senate, with Midwestern Republicans charging that the legislation was a throwback to the days when the Republican Party served the interests of industry without question. Taft, who had initially supported lowering the tariff, came to support the

Payne-Aldrich Tariff for fear that, if he did otherwise, it would cause a split within the Republican Party. Unwilling to interfere in the legislative process, Taft signed the bill and steadily drifted into the orbit of the Republican Old Guard. Accordingly, President Taft quickly alienated the progressive wing of his party, causing it to actually split, with the formation of the PROGRESSIVE PARTY, by the next presidential election in 1912.

### peace movement

At the beginning of the 20th century, the United States was solidifying its position as a new world power. Wars with Spain and in the Philippines transformed America's view of itself on the world stage and simultaneously spawned a peace movement that advocated internationalist cooperation, arbitration among nations, and the formation of a world governing body. Together, peace advocates hoped, countries could find alternatives to war. During these years, the peace movement grew by leaps and bounds, as witnessed by the exponential increase in membership of established peace groups such as the American Peace Society, as well as by the creation of new peace organizations such as the CARNEGIE ENDOWMENT FOR INTERNATIONAL PEACE.

Many peace advocates participated in the Progressive movement, which maintained that social and political forces, including war, threatened to destabilize society. They believed, moreover, that these forces could be managed and regulated by professionals through new legal frameworks and state regulations. Peace reformers thought that the end result of such efforts would be a more orderly, predictable, prosperous country and a more peaceful world. Not all peace advocates, however, were pacifists; rather, the Progressive Era peace movement was divided among elite peace advocates who sought to end the waste of war and radical pacifists who were both anti-war and antiviolenence.

Peace reformers came from a range of backgrounds, including churches, business, government, social reform networks, and education. Prominent among reformers was industrialist Andrew Carnegie and Elihu Root, one-time secretary of war (1899–1904) and secretary of state (1905–09). Among elite peace advocates, President THEODORE ROOSEVELT, who promoted America's role in mediating between belligerent countries, played a prominent role.

Roosevelt won a Nobel Peace Prize for his role in ending the RUSSO-JAPANESE WAR of 1905. Among more radical peace advocates were domestic social reformer JANE ADDAMS and other women progressives, including GRACE ABBOTT, CARRIE CHAPMAN CATT, ALICE HAMILTON, FLORENCE KELLEY, JEANNETTE RANKIN, and MARY HEATON VORSE. Addams, who won the Nobel Peace Prize for her peace work, proposed replacing war with altruistic international public service to satisfy people's need to demonstrate patriotism and glory.

Despite their backgrounds and their political differences about how to achieve peace, virtually all peace advocates prior to WORLD WAR I agreed that the United States, which enjoyed relative security, should take a leading role in promoting international peace, that periodic international congresses should be held to promote discussion on peace issues, that some type of legal framework should be used as a peacekeeping mechanism, and that an international court should be established.

The movement witnessed early success with the 1907 Second Hague Peace Conference, where delegates discussed how to limit armaments, develop international peacekeeping law, and establish a permanent body. International representatives, however, failed to agree on anything except the most general endorsement of international peacekeeping. Although the conference fell far short of producing a substantive international agreement, the mere fact that American delegates were prominently featured and that there were ongoing international peace discussions solidified American peace activists' international and domestic reputations. To many peace reformers, furthermore, the growing visibility of America's role as international peace advocate was success in itself.

The first substantial challenge to peace in the 20th century was the escalating conflict in Europe, which eventually led to the First World War. At that time, European nations were engaged in a military arms race and in competition over colonies and resources in Africa and Asia. Tensions came to a breaking point over the assassination of the Austrian heir to the throne, and Germany, Austria-Hungary, and Italy were soon at war with Great Britain, France, and Russia. The massive scale of the war and the mounting death toll did not deter other nations from entering the war, especially after Germany violated Belgian neutrality in its first military offensive. The United States, however, maintained a generally isolationist foreign policy at the onset of war in August 1914. Still, the country began to prepare for war with an extensive PREPAREDNESS campaign.

In contrast to the early years of the century, World War I caused the American peace movement to fracture along conservative and radical lines. The nature and duration of the war in Europe, along with German tactics on the high seas (submarine warfare), pushed many longtime

peace activists to support the Allies. Seeing Germany as a threat to the international order and to peace, they promoted military support to the Allies rather than employing the prewar methods of choice, such as mediation, for resolving international disputes. Conservatives in the peace movement looked to the end of the war as an opportunity to create the international body that they had long sought.

Partially due to the established peace groups' unwillingness to oppose the war, radical peace groups were formed, including the American Union against Militarism (AUAM), the Woman's Peace Party, and the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM (WILPE). Jane Addams and other prominent feminists organized and led the latter organization. Activists in the newly created organizations came from established social reform networks, including churches, and labor and women's groups. They decried both sides in the conflict and promoted a quick and peaceful end to the war. Specifically, they wanted the United States to bring the belligerents together, help mediate, and conclude a just peace, which included arms reductions and no annexations.

President WOODROW WILSON, one-time member of the American Peace Society, wanted a quick end to the war with a lasting peace. Initially, he believed that the United States could best protect its diplomatic and economic interests if it remained neutral and attempted to mediate among the warring countries. At this time, Wilson maintained a regular dialogue with domestic peace groups. These interactions contributed to Wilson's growing faith in mediation as a tool in international relations, and ultimately they influenced the formulation of his Fourteen Points. His mediation efforts, however, failed, and conflict with Germany intensified in early 1917.

America's declaration of war in April 1917 deepened the schism between conservatives and radicals in the peace movement. Wartime circumstances produced a political environment in which criticizing the war and the government were not acceptable. Most peace groups remained silent, focusing instead on the postwar settlement. Interested in the peace groups' input, the Wilson administration consulted with some of them, most notably the conservative Elihu Root of the Carnegie Endowment for International Peace. Indeed, when Germany agreed to sign the armistice of November 1918, it did so on the basis of Wilson's Fourteen Points, which reflected, to a large extent, the internationalist goals of the American peace movement.

The intense debate surrounding the TREATY OF VERSAILLES and the LEAGUE OF NATIONS further divided and disillusioned peace activists. Some peace promoters, including members of WILPF, maintained that the league was far from perfect as it did not press countries to disarm and failed to advocate self-determination. The United States never joined the League, due primarily to domestic political

opposition, but the organization was formed, realizing one of the visions of the peace movement. Consequently, many peace activists turned to other peace-related causes, such as relief work in war-torn countries. Pacifist groups such as the FELLOWSHIP OF RECONCILIATION and the American Friends Service Committee pursued international outreach as a cornerstone of their antiwar philosophy.

Renewed political commitments to military spending galvanized the peace movement into the 1920s. Disarmament rejuvenated dormant peace groups such as the AUAM and created new ones like the National Council on Limitation of Armaments. In 1919, the War Department proposed compulsory peacetime service. In 1920, the navy proposed a large expansion of the Atlantic and Pacific fleets. Groups distributed antimilitarist literature and organized mass meetings, among other activities, to warn the public about the dangerous direction in which the country was headed. Their activism contributed to the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT in 1921–22, which led to arms limitations agreements. The event also signaled America's continued interest in international peace, despite the United States's failure to join the League of Nations. The treaties, moreover, revealed how the peace movement could successfully marshal public opinion in the aftermath of World War I. The peace movement continued to pressure politicians to press for disarmament.

The next pressing issue during the 1920s was the establishment of the Permanent Court of Justice, or World Court. This issue generated renewed optimism in American participation in an international body. As with the debates about American participation in the League of Nations, political in-fighting produced sharp divisions regarding American responsibility on the world stage as well as further disillusioned peace advocates about working with politicians toward an alternative to war.

Despite misgivings, peace reformers were encouraged by American and French collaborative efforts at outlawing war, including those by Secretary of State Frank B. Kellogg. The KELLOGG-BRIAND TREATY for the Renunciation of War, signed by most of the world's major powers in 1928, declared war illegal, except as self-defense. Although largely symbolic in spirit, and lacking in enforcement mechanisms, the Kellogg-Briand Treaty exemplified the spirit of international cooperation that characterized the peace movement since the dawn of the 20th century. This optimism would be dampened throughout the next decade as Europe, once again, moved incrementally toward war.

**Pershing, John Joseph** (1860–1948) *commander of World War I forces*

Commander of the AMERICAN EXPEDITIONARY FORCE (AEF) in Europe in WORLD WAR I, John Pershing preserved the unity of the American army in the face of pressure to divide it among the allied forces. The European allies had suggested dispersing American units as well as limiting their participation. A desperate need for troops on the European front gave General Pershing the power to insist on independence, and the AEF became a central force in the last year of the war.

Pershing was born in Linn County, Missouri, on September 13, 1860. His father, John Fletcher Pershing, was a tracklayer for the North Missouri Railroad at Warrenton, Missouri. He married Ann Elizabeth Thompson on March

General of the Armies John J. Pershing (*World Military Leaders: A Biographical Dictionary*)

22, 1859. Once the Civil War began, Pershing's father bought a general store, two farms, and a lumberyard. He would later lose most of the farmland. John Joseph Pershing worked on his father's land, attended school, and later taught school. After attending Normal School from 1880 to 1882, Pershing won an appointment to West Point.

On graduating from West Point in 1886, Pershing began his army career in the Apache and Sioux campaigns of 1886 and 1890. In Cuba, during the Spanish-American War, he served throughout the Santiago Campaign. He fought at San Juan Hill, for which he was awarded the Silver Star. Pershing was assigned to the Philippines in 1899. There he helped suppress the Moro Insurrection. His return to Washington allowed his introduction to Helen Frances Warren, a daughter of the senator from Wyoming. They were later married in 1905. Pershing commanded American forces in Mexico during the pursuit of Pancho Villa in what became known as the MEXICAN INVASION. He was promoted in September of that year to major general.

In 1917, General Pershing was one of the few American generals with battle experience. He knew the United States needed a huge army to make a difference in the stagnating war in Europe. The military draft brought millions into the army, but they needed to be trained. As a result of Pershing's efforts, great numbers of American soldiers began to arrive in France in early 1918. Despite problems with supplies, training, and equipment, the American soldiers were fresh as compared with the war-weary French and British. Pershing sent AEF divisions into action in March. He led the first major American offensive of the war in September. In the fall, the AEF fought its largest offensive in the Argonne Forest. During the course of the war, the American Expeditionary Force saw only 150 days of combat; but in that time, it seized 485,000 square miles of enemy-held territory and captured 63,000 prisoners, 1,300 artillery pieces, and 10,000 mortars and machine guns.

After the war, Pershing became chief of staff for the U.S. Army. He died at Walter Reed Army Medical Center in Washington, D.C., on July 15, 1948. He was buried in Arlington Cemetery, his grave marked only by a simple marker, as was his wish, near other soldiers from World War I.

## photography

In the early 20th century, American photography expanded from its base in portraiture and landscape to become both an increasingly important art medium and a form of

social documentation that revealed social problems and expressed political ideas. At the same time, photography became democratized, as newer, simpler, and cheaper cameras made photographs available to ordinary people. The technology of photography, from lens to cameras, film, and processing, made the snapshot the most common form of portraiture, archiving personal and public memories and capturing in still photography celebrations, family gatherings, and the mileposts of everyday life. As tourism became a common pastime, photographers found new subjects in landscapes, public monuments, and leisure activities. During the first 30 years of the century, the work of two influential American photographers—Alfred Stieglitz, who transformed photography into a genre of art and mentored the next generation, including Edward Steichen and Ansel Adams; and Lewis W. Hine, whose documentary photography inspired the next generation of social journalists, including Walker Evans and Dorothea Lange—captured the imagination of elite and popular audiences.

It was in 1900 that Kodak introduced the first Brownie box roll-film camera, an invention that made photography available to ordinary families. While portrait studios continued to play a role in commemorating life stages, the box camera made it possible to record not simply life course events but everyday picnics, baseball games, family reunions, and gatherings of friends in snapshots that were relatively easy to develop, reproduce, and share. Much of this had been under way by the turn of the century, as George Eastman took older plate methods of photography and introduced roll film and a developing process called "photofinishing," the cost of which was figured into the price of a roll of film. With further refinements, Eastman's Kodak cameras quickly dominated the market, so that the hordes of new snapshot photographers became known as "Kodakers." The company continued to lead the industry by improving and simplifying cameras and processing. By 1906, panchromatic black-and-white film, which made high-quality color separation photography possible, was introduced, but color photography was not available to the mass market until Kodak introduced new color film in the 1930s and 1940s.

Much of the basic technology for photography was in place by the turn of the century. What was different was how photography increasingly was used as a form of artistic expression and made inroads into the galleries and museums of fine art. The individual most responsible for these changes was Alfred Stieglitz. In contrast to amateur photographers, Stieglitz and other pictorialists, including Gertrude Kasebier, Clarence White, and Edward Steichen, focused on composition and darkroom techniques in their photography, shunning the easy composition and uncontrolled spontaneity of snapshots. The group promoted a new aesthetic for photography in what they called the Photo Secession. They exhibited their work at

the 291 Gallery on New York's Fifth Avenue, understanding photography not simply as a mirror of reality but as an artistic lens. Stieglitz was the chief spokesman of the new movement, mentoring younger photographers, expanding the exhibition space available for photographic work, and editing the central publication of the Photo Secession, *Camera Work*, from 1903 to 1917. His own photographic work took a turn away from the self-consciously artistic techniques of the Photo Secession to what Stieglitz considered "straight photography," without, that is, darkroom transformations or altered media. At the same time, in his categorization of "art photography" apart from documentary work, Stieglitz polarized photographic criticism and shaped the reception of documentary photography for decades to come.

The individual whose career and work contrasts most sharply with that of art photographers was Lewis W. Hine, a

generation younger than Stieglitz and a politically committed photographer. Drawing on earlier documentary photography, Hine focused his camera work on the world of ordinary workers, in particular child laborers at their jobs in factories, textile mills, canneries, mines, and working in the street trades. Between 1907 and 1917, Hine created a remarkable series of photographs of child labor for the National Child Labor Committee. He also worked for the Pittsburgh Survey under the leadership of Paul Kellogg. Often working in dark and gloomy spaces, Hine improvised new techniques that allowed for the conditions and time constraints. He reinvented portraiture with his informal photographs of children working at looms, immigrant steelworkers gathered on a stoop, men on the steel girders of bridges and buildings. Employed by the American Red Cross, Hine photographed war refugees and displaced persons in a Europe devastated by world war. By the 1920s, Hine returned his lens to the urban workplace. His classic photographs, published in 1932 as *Men at Work*, captured both the working conditions and the aesthetics of labor in the United States. In particular, Hine's photographs of the construction of the Empire State Building, a series begun in 1930, stood out.

While Hine understood and contributed to the technique, aesthetic, and content of photography, he was not always recognized as an artist by art critics and photographers. For the most part, Hine saw himself less as an artist and more as a photographer doing the cultural labor of investigating and educating the public about the lives of immigrant workers and child laborers. As historian Alan Trachtenberg notes, Hine's goal was not photographs in an exhibition but published images. Nevertheless, his photographs are understood today as both social documentary and art, with their bold, moving, and insightful images and their ability to capture human experience. His work, as the work of Stieglitz and others of their periods, laid the basis for modern American photography and provided us with a visual archive of their time.

**Pinchot, Gifford** (1865–1946) *conservationist, politician*

Gifford Pinchot was one of the leading naturalists and conservationists of the 20th century and played a crucial role in the development of the conservation movement. From 1893 to 1910, he headed the U.S. Forest Service, during

Photograph of a horse-drawn coach during a snowstorm in New York City by Alfred Stieglitz, ca. 1905 (*Library of Congress*)

which time he had tremendous influence on President THEODORE ROOSEVELT's conservation policies. Under Roosevelt's administration, the number of national forests increased from 32 to 149, covering 193 million acres. The son of a New York businessman, Pinchot became interested in forestry and conservationism at an early age. After graduating from Yale in 1885, he spent several years studying forestry in Europe. Pinchot's rise to prominence began when he was appointed to the National Forest Commission in 1897. Because of his service on the commission, President William McKinley named him chief forester of the United States in 1898.

By the 1880s and 1890s, the nation's appetite for natural resources, particularly timber, had become insatiable; and vast tracts of forest were rapidly disappearing. Where preservationists such as John Muir believed that some regions of the country and some natural resources ought to be off-limits to growth and development, Pinchot and other conservationists concluded that it was neither realistic nor desirable that commercial use of natural resources be curbed or eliminated. If the nation's economy was to continue growing, it needed a constant supply of resources. For these reasons, Pinchot pushed the federal government to become actively involved in land use management. He argued that the government had to ensure that the nation's resources were not squandered and wasted by inefficient and careless use. By 1910, two years after WILLIAM HOWARD TAFT became president, Pinchot concluded that the government had abandoned its commitment to conservationism. After filing suit against Richard Achilles Ballinger, Taft's secretary of the interior, Pinchot was dismissed as head of the Forest Service.

After he left the federal government, Pinchot launched a successful career as a progressive Republican politician. In 1914, he ran for and lost the Senate seat in Pennsylvania. His platform included support for women's right to vote, a graduated income tax, a workmen's compensation law, and the right of workers to form legally recognized labor unions. After this initial setback, Pinchot went on to win the Pennsylvania governorship in 1922 and again in 1930. As governor, he instituted numerous bureaucratic and legislative reforms and recruited women, African Americans, and Jews to serve in his administration. In addition, Pinchot helped to establish rural electrification and anti-poverty programs and frequently sided with organized labor, using his office on several occasions to resolve protracted labor disputes.

Although an important progressive Republican, Pinchot's lasting contribution came from his views of land use and the conservation of natural resources. His views played an important role in shaping both the conservation movement and the federal government's approach toward land use from the turn of the century until the rise of the

modern environmental movement of the 1960s. Conservationism provided a much-needed balance to the dominant free market approach toward natural resources and the environment, but it also served to mute the preservationist impulse and legitimized the nation's insatiable use of natural resources under the guise of wise and efficient use.

**Pingree, Hazen S.** (1840–1901) *Republican mayor of Detroit and governor of Michigan*

Hazen Pingree is best known as a reform mayor of Detroit and as the governor of Michigan. An early Progressive, Pingree advocated stronger government regulation of transportation and electric and gas utilities, and he sought to end political corruption. During his time in office as mayor (1890–97) and governor (1897–1901), he advocated a wide range of reforms, including the eight-hour workday and the DIRECT ELECTION OF SENATORS.

Born in Denmark, Hazen Pingree emigrated to the United States at an early age. He worked as a shoemaker and served in the Union Army during the Civil War with the First Massachusetts Heavy Artillery Regiment. After the war, he moved to Michigan and worked as a cobbler. In 1872, he married Frances A. Gilbert. The couple had three children, two of whom survived to adulthood (Joe and Hazel). Pingree established his own business, the Pingree and Smith Shoe Company, in 1866. The success of the firm allowed him to engage in local politics.

In 1889, Pingree ran for mayor in Detroit. Elected on a platform of cleaning up corruption, he took on the job of reforming city street and sewer contracts and the school board. He led the fight against privately owned gas and electric utilities and took on the Detroit City Railways in an effort to lower their fares. When the company's president, Tom L. Johnson, resisted, Pingree set up a municipally owned company to compete with Johnson's private monopoly on city transportation. In the 1893 depression, Pingree created new public-welfare programs to feed the unemployed, poor, and homeless. As part of the effort, he organized public works projects to build new schools and parks and set up a program to give public land for vegetable gardens to the poor.

Pingree successfully ran for the governorship in Michigan in 1896, before he had finished his term as mayor. A court case ensued, contesting his right to hold two public offices at the same time. The Michigan Supreme Court decided against the new governor, and he resigned from his city office. As Michigan governor, Pingree advocated

a graduated income tax, new railroad taxes, and further political reforms.

After Pingree finished his term as governor, he joined a safari to Africa with Vice President THEODORE ROOSEVELT. Stopping in London on the return home, Pingree became ill and died of peritonitis at age 60. He is buried in Woodlawn Cemetery in Detroit.

## politics

Between 1900 and 1930, political life in the United States underwent a significant transformation. The character of the electorate, the rules and procedures for elections, and the way in which parties and politics were organized all changed. While electoral politics continued to be dominated by the DEMOCRATIC PARTY and the REPUBLICAN PARTY, the emergence of LOBBYING AND INTEREST GROUPS altered how parties and individuals influenced political outcomes. At a time of declining party identification and voter participation, the two parties continued to control the major governmental institutions of the presidency, CONGRESS, and the court system, in large part due to their ability to incorporate new public interest lobbies into the workings of party politics.

For most of the 19th century, historians have argued, politics ran along a divide between party and electoral politics on the one hand and a more issue-driven reform politics on the other. The principal tools of parties were the ballot and party organization; the principal means of pursuing reform politics were lobbying, petition, and public protest. By 1900, however, voters were increasingly alienated from party politics. New practices, such as split ticket voting and independent lobbying, reinforced a decline in party loyalty and an upsurge in independent political organization. Finding new ways to educate the public, inform legislators, and pass laws meant that the younger generation of active citizens was able to enter political life and significantly shift politics away from party agendas. Organizations such as the League of Women Voters emerged to educate and mobilize voters, and social organizations such as the National Mothers' Congress and the American Farm Bureau pursued their political agendas in new ways.

The shift toward interest group politics had contradictory results. Undertaken under the banner of greater democracy, political reforms such as the direct primary, initiative, referendum, and recall, and the DIRECT ELECTION OF SENATORS, along with the granting of woman suffrage,

URBAN REFORM, and new voting laws, gave "the people" greater direct access to their representatives. Ironically, it gave the same or better access to corporate interests.

In the government, the electoral realignment of 1896 guaranteed Republican Party control of all three branches of the federal government. Between 1896 and 1932, the Republican Party won every presidential election except the elections of 1912 and 1916, when it was badly divided. The old competitive states such as Ohio, Indiana, and New York, which the two major parties had contested in election after election, now became solidly Republican. In Congress, the Republican Party dominated the House of Representatives between 1900 and 1911 and from 1919 until 1932 and the Senate from 1900 to 1913 and again from 1919 to 1932. Dominance over the office of the presidency also guaranteed control over the judiciary. At the national level, Republican presidents nominated 18 of the 21 Supreme Court justices appointed between 1898 and 1932. The lower federal courts were similarly slanted.

Despite the continued dominance of the two-party system, the years between 1900 and 1930 saw many political experiments come to the fore. Third parties launched successful campaigns at the state and local level and passed reforms governing political and economic life. At the forefront of change was the increasing influence of SOCIALISM, both in the writings of American socialists such as Edward Bellamy and CHARLOTTE PERKINS GILMAN and in the thought of European radicals Karl Marx and Frederick Engels. Public intellectuals such as JOHN DEWEY and William James began to rethink how society should organize public life, labor, community, and family. Progressive politicians such as ROBERT LA FOLLETTE and TOM JOHNSON integrated socialist ideas about land reform, municipal or public ownership of utilities, and transportation into their political agendas. The growing number of votes for socialist presidential candidate EUGENE V. DEBS and the success of local and state socialist candidates, shown in the election of more than 300 mayors, city council members, and state legislators, pushed mainstream politics to the Left. As the intellectual basis for PROGRESSIVISM, socialist thought helped reformers challenge relations between individuals and government, private interests and public welfare, and employers and workers. Socialist thought shifted the balance away from sovereign property rights to a new investment in human rights.

Demands for social change eventually hit the wall of conservatism within the political system. At the beginning of the 20th century, Congress was still the dominant branch of government. The Senate served as a break on the new reform measures passed by the popularly elected House of Representatives. The court system was an even greater obstacle to federal and state legislation, as both state and federal courts envisioned limited government and the

primacy of property rights. Faced with these obstacles, Progressives arrived at a critique of how politics were organized. The lack of direct democracy, the concentrated power of business and banking interests in government, and the party system itself were at fault. As the MUCKRAKERS discovered, many forces in American life were susceptible to corruption and vulnerable to the influence of large corporations. Money corrupted politics, and many progressives sought to curtail its influence in public life.

For one, Progressive politicians pushed for the reform of the party system and new forms of direct democracy. In several states, political reformers passed resolutions for direct primaries, substituting them for the “smoke-filled rooms” of party caucus and convention. West of the Mississippi, several states passed initiative, referendum, and recall, which allowed voters to initiate their own legislation, approve legislation passed by the legislature, and recall elected officials who were either incompetent or corrupt. In particular, there was an interest in recalling judges, for the judicial system acted to forestall and undermine progressive reforms. One of the most important democratic reforms of the day was to change the way senators were chosen. Prior to the passage of the Seventeenth Amendment, state legislatures appointed individuals to serve in the Senate. The process was rife with opportunities for bribery and corruption, and it tended to give greater power and weight to rural districts, which were more conservative. With the ratification of the amendment for direct election of senators, voters chose among individual candidates, usually nominated by major parties, for Senate seats. Urban reform measures, which gave some cities commission governments and took power out of the wards and the hands of political machines, were seen as the local complement of direct democracy. By shifting the balance of political power away from political parties and toward individual voters, it was hoped that the democratic will would prevail.

If these reforms seemed a democratization of earlier practices, they did not, on the whole, open up the process. Initiatives and referenda required party candidates or interest groups to endorse them. Further, these political reforms were mirrored by others, which both broadened (through woman suffrage) and narrowed (new voting regulations) the number of men and women eligible to vote. Done against the background of the ratification of the Nineteenth Amendment (granting women the right to vote) and the introduction of new voting and immigration laws (restricting entry to the United States and altering rules concerning citizenship and marriage), the voting regulations required longer periods of residency and stricter control over the ballot. These moves discouraged voters and prompted, over the course of a decade, precipitous declines in voter participation and party identification. It also promoted more independent voting. Finally, new women voters played a

role. Apart from agitating for labor legislation and maternal health, women became more active in party politics. By 1933, many women had held public office, including two governors, one senator, 14 representatives, and thousands of state and local legislators and city and county officials.

In the realm of third-party politics, the first three decades of the 20th century saw growth in the number of non-mainstream party votes. Several major party candidates ran on non-party platforms during the period. In 1912, the PROGRESSIVE PARTY nominated THEODORE ROOSEVELT, who received one of the highest total votes for a non-party candidate. The Progressive Party nominated Republican CHARLES EVANS HUGHES in 1916 (he narrowly lost to WOODROW WILSON), and in 1924, it put forth the progressive Republican Robert La Follette and the progressive Montana Democrat Burton Wheeler as the Progressive Party ticket. In addition, farmer-labor parties were active at the state and local level, as they were in the 1910s with the NON-PARTISAN LEAGUE and in the 1920s with the FARMER-LABOR PARTY. Lastly, parties on the Left thrived in small but significant numbers. Socialist Eugene Debs ran for president in a series of elections, and in 1916 and 1920 he earned over a million votes. The conservative backlash after WORLD WAR I culminated in the RED SCARE and put an end to the strong showing of third parties.

Parties began to suffer from the decline of voter participation but not more so than the party workers themselves. The decline of party machines and party patronage meant that political parties had to find new ways of financing political campaigns and staffing of the effort to get out the vote. In the wake of WOMAN SUFFRAGE, women, who on the whole had greater leisure time than men, became party members and performed much of the voluntary labor behind campaigns. Women winning the right to vote also meant the election of women to public office, which they did in significant numbers during the early to mid-1920s.

Despite the conservative turn of the 1920s, there were definitive changes in American politics that suggested a continuity throughout the period. While Republican presidents strove to maintain “normalcy” in government affairs, the period saw increased demands for government regulation and social provision. Not only did the regulatory state emerge from such initiatives as antitrust suits, the HEPBURN ACT, and the MANN-ELKINS ACT, but also the country witnessed the emergence of a social welfare state in state and national legislation for workers’ compensation, the growth of mothers’ pensions, and protective labor legislation. The invention of War Risk Insurance during World War I, the creation of the VETERANS BUREAU and programs for disabled veterans, and the SOLDIERS’ BONUS of 1924 revealed greater public support for social provision under the right circumstances and with the correct constituency.

Public opinion began to embrace a larger and more active government role in the arenas of public welfare and regulation of the economy. Even during the backlash against progressive reform during the 1920s, the federal budget grew. Politics continued to embrace a wide range of ideologies, agendas, institutions, and tactics, and opened the way for the realigning politics of the 1930s.

## popular culture

Between 1900 and 1930, American popular culture underwent a transformation characterized by the development of national popular culture and its commercialization. Popular culture refers to cultural activities and products that appeal to broad audiences. It includes popular LITERATURE, RADIO broadcasting, popular MUSIC, popular dance and theater, SPORTS and recreation, some decorative arts, and motion pictures. During the first three decades of the century, corporations increasingly turned out cultural productions for popular consumption to make a profit. This led to tensions between a popular culture created by people themselves and popular culture created by commercial interests. The transformation of popular culture into a broad-based national phenomenon occurred as a result of economic, social, demographic, and technological changes of the emerging industrial age.

The rise of modern popular culture was made possible by the tremendous growth of American cities, the emergence of the urban middle class, changing social values in regard to leisure, technological advances, and a rise in real wages for almost all workers. As the urban population exploded early in the 20th century, cities became the sites in which popular culture was created and consumed. Easy access to large audiences gave cultural producers such as movie makers and amusement park owners an economic incentive to produce products that catered to these new audiences. In addition, corporations were growing in size and required increasing numbers of white-collar workers. These workers, many of whom were children of immigrant parents, earned enough money to afford movies and plays, and they had the time in which to do so. A new ethos in

regard to leisure activities also was emerging, as middle-class Americans rejected traditional beliefs that restricted their use of leisure time. Wage workers also were improving their standard of living. Better wages meant that, for the first time, many wage earners and their families could afford new public amusements. Finally, the improved abilities to transmit information over wire and through the air brought different regions into closer contact than had ever been possible. Chains of VAUDEVILLE theaters and national sports leagues gave many Americans common experiences. All of these developments helped transform popular culture into a national culture that often cut across ethnic, social, and regional groupings.

As producers of popular culture tailored their offerings to appeal to a broad audience, the cultural differences between these groups diminished. In doing so, popular culture helped Americanize the millions of immigrants who came to America. At the same time, some forms of popular culture reinforced group differences, as each group interpreted popular culture among themselves. Popular culture thus could simultaneously diminish cultural differences and help maintain them. In Vaudeville theaters, for example, audiences often consisted of a cross-section of urban society. Members of these audiences joined in a unifying activity that brought people of numerous backgrounds together. At the same time, there was a hierarchy of theaters determined by the cost of a ticket. The more expensive theaters tended to be downtown while less expensive theaters operated in working-class immigrant neighborhoods. The performances often catered to the audience, creating different versions of popular culture within the same cultural institution. The same dynamic occurred in public amusement parks such as Wonderland and Luna Park at Coney Island, New York. The crowds that streamed out of New York City to Coney Island consisted of all ethnic and class backgrounds, and they all shared some of the experiences at the parks. There were, however, different sections of Coney Island, differentiated by the cost of food and lodging. Thus, a popular culture activity could be both unifying and divisive.

BASEBALL serves as an informative example of how popular culture emerged out of the new industrial urban environment. Americans had been playing baseball since before the Civil War. Only in the 20th century, however, did it become the national phenomenon that it still is today. Baseball's increased popularity was due to a variety of factors. First, the sheer number of urban residents who could attend games provided a potential audience. Second, it appealed to urban Americans as a throwback to simpler times. Going to a baseball field with its green grass provided an opportunity to spend the afternoon in an environment that reminded city residents of the recent rural past. The players came from a variety of backgrounds, which

Luna Park at Coney Island, N.Y. (*Library of Congress*)

made it possible for any fan to find players that they related to because of their ethnic identity. Baseball's popularity rose from more than these factors, however. Seizing upon a money-making opportunity, the team owners built larger stadiums and relied on marketing to attract audiences. One marketing strategy was the creation of the star system in which team owners marketed their best players to attract audiences. It made many players household names.

Motion pictures emerged during this time to take their place at the center of popular culture. The first motion pictures to be marketed to a public audience purely for entertainment purposes were shown in nickelodeons in large cities. The nickelodeons were commercial spaces that contained anywhere from five to 50 viewing machines. Patrons dropped their five cents in a coin slot and watched a brief film. The subjects of these films ran anywhere from acrobatics and animal acts to films of men and women kissing.

The films did not have sound. The nickelodeons quickly became the most popular form of entertainment in America's cities and provided the basis for the nascent MOVIE INDUSTRY. The novelty of the motion picture combined with the affordability appealed to a broad audience.

A combination of audience desire for longer films and entrepreneurs' realization of the money to be made led to the development of big screen films. The first films that were shown on a screen in front of audiences were exhibited as educational films in traveling shows. Entrepreneurs realized that there was money to be made from the urban audiences who attended vaudeville shows. Vaudeville theaters began to show motion pictures as part of the show. By the 1910s, movies had separated from vaudeville, and motion picture theaters began to spring up in cities.

Changes in the quality and type of films increased their popularity. Initially, films consisted of short clips. The

appeal of these was limited, once the novelty wore off. To meet the demand for more meaningful films, filmmakers began to make films that told a story. The first film to tell a story was the 1903 *Great Train Robbery*. The quality of early films in terms of technology and filmmaking left much to be desired. The 1915 *BIRTH OF A NATION*, a racist account of reconstruction after the Civil War, was a turning point in filmmaking. It used new lighting techniques and acting techniques to make a more realistic representation. It made more money than any film of its time and helped revolutionize filmmaking. By the 1920s, motion pictures had become the most popular form of entertainment in the United States. Movie stars such as Mary Pickford became household names as the movie studios used the same star system as baseball teams did to market their films and the entire industry.

Radio was another element of popular culture that developed from commercial interests. Although the technology was invented in the late 19th century, radio did not occupy a significant space in American culture until after WORLD WAR I when the commercial possibilities of radio were first realized. The first radio broadcasting stations were set up by the companies that manufactured radio equipment. GENERAL ELECTRIC, Westinghouse, and American Telegraph and Telephone all realized that they could sell more radio equipment if the public had something to listen to. Initially this was all done on a local basis. The radio owners living near Pittsburgh, for example, could listen to the first permanent station, KDKA, created by Westinghouse in 1920, but audiences outside of the listening area could not. In addition, all the programming was local, consisting of music, Broadway plays, and news among other things. The programming was sporadic, because the local stations did not have access to large amounts of music and other entertaining programs. Programming changed in the mid-1920s with the establishment of the network system. The National Broadcasting Corporation and the Columbia Broadcasting System provided their affiliate stations a certain amount of programming each day. The local stations filled the remaining airtime. The network system helped nationalize popular culture, because radio listeners all over were listening to the same program. Moreover, the national programs were sponsored by the manufacturers of certain products, which then became household names. This helped create a national market for some products. The first radio program to put all these trends together was the *Amos 'n Andy* show, which premiered in 1929. Thus the 1920s were only the beginning of radio's important role in popular culture.

A range of different genres characterized popular literature during the first decades of the century. As books became more affordable in soft covers and literacy spread, literature became more popular. Best sellers came from a

number of different genres. Sentimental novels such as *Polyanna* and *Rebecca of Sunnybrook Farm*, religious books, historical fiction, westerns such as *The Virginian*, sensationalist exposés such as Upton Sinclair's *The Jungle*, and detective mysteries all found their way onto the bestseller lists. Pulp fiction also emerged as a form of popular literature. Named for the cheap paper stock on which they were printed, these magazines appealed to specialized audiences with serial and short stories of all sorts. They sold for 10 cents. Initially, they included a variety of story types, but by 1910 magazines began to specialize. Some were detective fiction magazines, others Westerns, while others published love stories. By the mid-1920s, some of the pulp magazines had circulations of 500,000.

Dance crazes were another form of entertainment that became a part of popular culture. The ability to publish sheet music in large quantities helped spread music and the dances that often accompanied specific songs. In the 1920s, radio helped spread both the songs and dances. Many of the dance crazes appealed to youths because they allowed them to engage in close physical contact. The dance crazes of the pre-World War I years included the turkey trot, grizzly bear, and the bunny hug, all of which allowed close physical contact. After the war, dances such as the Charleston and the Lindy Hop became national phenomena as Americans embraced the fast-paced dances that accompanied the fast-paced lifestyle that helped define the decade.

Changes in popular music accompanied the various dance crazes. The most significant development in music was JAZZ. Evolving from a combination of the blues, ragtime, and brass band music, jazz was America's only unique musical form. Prior to the rise of jazz, European orchestra music dominated the American music scene. A few American composers were writing pieces for orchestras, sentimental art songs, dances for keyboards, and songs for vaudeville. It was not until the rise of jazz, however, that an American form of music emerged. The GREAT MIGRATION of African Americans from the South to northern cities played an integral role in the development of jazz. The migration brought both musicians and an audience to the urban North, where commercial record producers helped popularize jazz.

By the end of the 1920s, popular culture had taken its modern form. Popular wants and commercial possibilities helped create a popular culture that was also a mass culture. This dynamic has led some to question whether popular culture rises from the people or is created by commercial enterprises seeking a profit from mass consumption. During the years from 1900 to 1930, commercial interests began to dominate the production of popular culture. It is important to remember, however, that the individual still made the daily choices that decided which cultural products and activities were truly popular.

### population trends

In the period between 1900 and 1930, the population of the United States continued to grow, albeit at a declining rate. In 1900, the total population was nearly 76 million; by 1930, it had grown to nearly 123 million. After experiencing high rates of natural increase early in the 19th century, a long decline in fertility finally began to show in population rates by the 1870s. A pattern of delayed marriage and low fertility associated with urban development continued to spread throughout cities early in the 20th century. Marriage rates climbed incrementally in these decades, with a slow decline in the number of people who never married. At the same time, the number of divorces rose rapidly from more than 100,000 in 1914 to more than 205,000 in 1929. Better than one in seven marriages ended in divorce. More open divorce laws had made it possible for men and women to start new relationships when old ones failed.

Changing family patterns had an effect on fertility as well. First, there was an increased incidence of sex outside marriage. Before 1900, only 14 percent of women (about one in seven) admitted to having premarital sex before they were 35. Among women in the generation of the 1920s, however, more than one in three (36 percent) had experienced premarital intercourse. Delayed marriage and new methods of BIRTH CONTROL furthered the general decline in fertility. New birth control clinics now provided advice and contraceptive devices, so that by 1925, one study reported that more than 80 percent of middle-class women used birth control. In contrast, only about 36 percent of poorer women did.

Fertility during these decades declined significantly. For white women, the crude birth rate dropped from 30.1 births per thousand in 1900 to 20.6 per thousand in 1930. In addition, the median number of children per woman declined for whites from 3.56 in 1900 to 2.45 in 1930. For African-American women, there was an even steeper decline, from 44.4 births per thousand in 1900 to 27.5 per thousand in 1930. The median number of children an African-American woman had, dropped from 5.61 in 1900 to 2.98 in 1930. Much of the decline can be attributed to rural-urban differences, as a disproportionate number of African Americans lived in rural areas and farm fertility, for

a number of reasons, remained high through the 1920s. At the same time, improvements in birth control, a rise in the age at marriage, and declining infant mortality created the conditions for a general drop in the fertility rate.

Between 1900 and 1920, the United States was at the high tide of IMMIGRATION with an average of 1 million immigrants entering the country every year. These immigrants, in contrast to earlier periods, were primarily from eastern and southern Europe. Arriving from the Austro-Hungarian Empire, Russia, Italy, and other southern European countries, they brought diverse religious and cultural practices to cities in the East and Midwest. The conflict of WORLD WAR I had a dampening effect on immigration to the United States. Obstacles to travel, from the national conscription to fear of submarine warfare, lessened the demand; fear of foreign subversion and radicalism, later expressed in the RED SCARE of 1919–21, brought about pressure for changes in immigration. Immigration laws such as the IMMIGRATION ACT OF 1917, the QUOTA ACT of 1921, and the NATIONAL ORIGINS ACT of 1924 introduced new restrictions ranging from literacy tests to national quotas. The new laws slowed the stream of European migrants into the United States, but migration from Canada and Mexico continued unaffected until the economic crisis of the 1930s.

Mortality also declined due to a number of reasons. Better nutrition, health care, and public hygiene cut the rates of infection and mortality from common epidemic diseases such as diphtheria, measles, typhoid, and tuberculosis. Life expectancy improved as better nutrition and medical care reached the general population. The average life expectancy in the United States rose from 47.3 years in 1900 to 59.7 years in 1930. At the same time, improving health and life expectancy did not reach all populations. Among African Americans, poverty, lack of health care, and malnutrition continued to take a toll on the rate of population growth, despite a higher fertility rate than among the general population. Among NATIVE AMERICANS, however, the long decline in population had halted by the turn of the century. Tuberculosis, which had ravaged Native American populations, became more manageable, and better nutrition slowly improved health.

Internally, there were significant movements of population throughout the period. Among them was the movement of African Americans from the rural South to the urban North known as the GREAT MIGRATION. Deteriorating race relations in the South and greater economic opportunity in northern cities brought a flood of migrants before and during World War I. From 1910 to 1920, the net migration of African Americans to cities was almost half a million. The pace of migration increased throughout the 1920s, with the net number of migrants numbering over 750,000.

A parallel development was the rural to urban migration that continued at an ever-increasing rate between 1900 and 1930. Rural to urban migrants had always been a substantial proportion of urban residents and contributed to the nation's becoming majority urban in 1920. The demand for labor during World War I had attracted southern migrants—both white and black—into northern industry. Cities such as Detroit and Chicago were transformed in the aftermath of the migration. But the greatest wave of rural to urban migration was due to the agricultural crisis of the 1920s, when many farm families and individual men and women left farms and rural towns to migrate to large cities. Lacking employment in the countryside and witnessing the decline of rural America, more than 19 million people made the trek from farms and small towns to cities during the decade. Not surprisingly, it was the disinherited youth who became the harbingers of change. One in four men and women ages 20 to 24 moved from rural areas to urban ones, where greater opportunities awaited them than in the depression-ridden agricultural regions of the Midwest and South.

By 1930, the United States was a nation that had reached demographic stability. Its population, while ethnically and racially diverse, grew at a steady but slow pace. The entry of European immigrants had slowed to a trickle due to new restrictive policies, and Mexican migration, while it increased in number over the 1920s, was not of the same magnitude. Fertility remained in a fairly steady decline that would deepen with the Great Depression, while improved PUBLIC HEALTH measures eroded mortality and morbidity rates.

## Preparedness

Before WORLD WAR I Preparedness became a movement to increase the military capacity of the United States as well as citizen support for war efforts. After the outbreak of European hostilities in 1914, organizations such as the National Security League, the American Defense Society, the League to Enforce Peace, and the American Rights Committee exerted pressure on an unwilling president WOODROW WILSON to strengthen military defenses. Wilson, who campaigned and won on keeping America

out of the war, stood behind his pledge of NEUTRALITY until events forced the United States entry into the war in 1917.

THEODORE ROOSEVELT was a leading advocate of the Preparedness movement. He wrote *America and the World War* in 1915 and *Fear God and Take Your Own Part* in 1916, which appealed to the people of the United States to prepare for war. These books helped popularize the Preparedness movement. Roosevelt disdained those who, like Wilson, were “Flubdubs and Molycoddles” ignoring the fact that the country was unprepared to fight. The Preparedness movement took offense at occupied Belgium's fate and decried “German atrocities,” which were said to be going on there.

In 1914, the Army War College issued a report entitled “A Statement of a Proper Military Policy for the United States,” which warned of depending on isolationism as a policy. It warned that newer technology, such as the submarine, the airplane, and the wireless telegraph placed the United States within the sphere of action of hostile nations. No longer could the United States depend on distance and geography to protect it. War College estimates demanded a standing army of at least 500,000 with a reserve of equal force. It also called for arms and training programs.

One such program was initiated by General Leonard Wood, a medical doctor turned soldier. He was the senior officer in the army and commander of the Department of the East. Wood established a military training camp at Plattsburg, New York. There, he and other professional men trained to be reserve officers. Administered by regular army personnel, the course was five weeks long. The Preparedness movement, financed by wealthy financier BERNARD BARUCH, caught on, and around 16,000 business and professional men were trained as officers in eastern cities.

As the United States inched closer to war, the issue of military preparedness gained new urgency. Organizations including the National Security League, the American Defense Society, the League to Enforce Peace, and the American Rights Committee held activities and Preparedness Day parades to further promote their cause. After German submarine attacks, especially the sinking of the *LUSITANIA* in May of 1915, Wilson dropped his opposition to an American military buildup. In 1916 he toured the country to urge support for preparedness, even though this was in direct opposition to his campaign promises of “Peace with Honor.”

In 1916, Wilson's secretary of war, Lindley Garrison, and his assistant, Henry Breckenridge, established a national defense plan with the support of Wilson that called for a “Continental Army.” The plan would build up forces over a three-year period in a federal reserve army. Congress disapproved, and Wilson withdrew support. Garrison and Breckenridge resigned. In June of that year, however,

Congress passed the NATIONAL DEFENSE ACT. It allowed the president to commandeer factories and establish a government nitrate plan, and it permitted the army to double its size by adding 11,450 officers and 223,580 enlisted men in annual increments over five years. The National Guard could expand to 17,000 officers and 440,000 men. A corresponding naval appropriations bill broadened the effect of the measure.

In spite of the National Defense Act, the nation was unable to recruit new troops up to the authorized strength. Militia and state forces had always been depended upon for emergency reserves. As a consequence, ground forces of the U.S. Army numbered only around 128,000 as America entered World War I in April of 1917. The SELECTIVE SERVICE ACT of 1917, which required that all men between the ages of 18 and 45 register in the Selective Service System, was used to bolster the military. A total of 24 million men registered, and the army was increased to 4 million soldiers. The Preparedness movement began to lose its *raison d'être* following the National Defense Act and the accompanying increase in naval expenditure in 1917. The movement disappeared when mobilization began following U.S. entry into the war.

## presidency

In the first three decades of the 20th century, the United States witnessed the beginning of what historian Arthur M. Schlesinger, Jr., called “the imperial presidency.” The president and the executive branch took the lead in setting American domestic and foreign policy as part of an unprecedented expansion of the federal government. Administrations incorporated and exercised new and significant powers in regulating the economy, employing ARMED FORCES in the world, and enlarging the agenda-setting role of the presidency. With the exception of the Lincoln administration during the Civil War, presidents had been relatively weak players in government. Compared to most of their 19th-century counterparts, whose powers consisted of federal patronage appointments in the postal service and customs house and governing the machinery of defense and diplomacy, early 20th-century presidents were known for their expansion of presidential power. They negotiated treaties among hostile powers, pushed reform legislation through CONGRESS, instituted new forms of national surveillance and law enforcement, and participated in military action throughout the world. By these initiatives, Presidents THEODORE ROOSEVELT, WILLIAM HOWARD TAFT,

WOODROW WILSON, WARREN G. HARDING, and CALVIN COOLIDGE reinvented the office. They collectively reshaped the SUPREME COURT, asserted new direction over federal legislation, and enlarged the administrative and police functions of the central government. While the power of the executive branch was not uncontested in these years, what Teddy Roosevelt called the “bully pulpit” of the presidency offered ample power to influence politics and public opinion not only on national issues but on regional ones as well, including local conflicts and legal cases that took on national importance.

The emergence of the United States as a world power after the Spanish-American War significantly contributed to the powers of the executive branch. Territorial possessions in Puerto Rico and the Philippines both supported and required an expanded military and diplomatic service, and presidents learned to use the sea power of the United States as a means of bolstering American interests in Asia, as shown in the so-called GREAT WHITE FLEET of 1907. Closer to home, American presidents regularly intervened in the internal affairs of Caribbean and Central American countries, since the Western Hemisphere was seen as fully within the American sphere of influence. While the United States asserted special claims and interests in Latin America as early as the Monroe Doctrine, it was only when the nation became economically and politically powerful that its claims had any validity.

Individual presidents bear much of the responsibility and credit for building the power and prestige of the American presidency. Theodore Roosevelt, who became president after William McKinley was assassinated, was an innovator in his expansion of the power and visibility of the presidential office. Not only was Roosevelt involved in pushing the United States into expanding the military and its involvement in the international arena, breaking with a more isolationist tradition that dated to the founding of the country, but he helped negotiate the end of the RUSSO-JAPANESE WAR, for which he won the Nobel Peace Prize. He also played a major role in developing the PANAMA CANAL. Domestically, President Roosevelt directed the Justice Department to take on corporate monopolies in antitrust cases, reshaped labor relations in the ANTHRACITE COAL STRIKE of 1902, and shepherded several regulatory laws through Congress.

President Woodrow Wilson similarly expanded the engagement and impact of the federal government in daily life. In particular, after he declared war on Germany in 1917, the federal government took on new tasks of investigating and keeping tabs on supposed radicals, immigrants, and labor unionists. In the name of domestic security, President Wilson gave authority to the newly created Bureau of Investigation (later the Federal Bureau of Investigation) and U.S. Military Intelligence to conduct surveillance on, investigate,

and sometimes assist in the arrest of resident aliens, political radicals, and civil rights and peace advocates. Further, to quiet domestic dissent, the COMMITTEE FOR PUBLIC INFORMATION produced propaganda campaigns in support of the war effort. WORLD WAR I brought other expanded powers to the federal government in the form of postal censorship, mobilization of labor and community resources, and strike mediation. Such agencies as the FUEL ADMINISTRATION and the WAR INDUSTRIES BOARD had new powers to regulate national resources; and for the first time ever, the WAR REVENUE ACT instituted a national income tax under the control of the executive branch. President Wilson's role in the peace negotiations at Versailles and his leadership in organizing the LEAGUE OF NATIONS marked a temporary high-water mark for the imperial presidency. Congress rejected both the VERSAILLES TREATY and the League of Nations, actions that signaled a backlash against strong presidential leadership in foreign affairs and the strength of isolationism in public opinion.

Calling for a "return to normalcy," President WARREN G. HARDING pursued a modest agenda for change during his time in office. Most of the governmental agencies created during the wartime crisis were abolished, and the federal budget was significantly cut. Developing a new budgetary process, negotiating naval arms reductions in the WASHINGTON CONFERENCE ON NAVAL DISARMAMENT, and reducing federal taxes and the national debt captured most of Harding's energies in his short time in office. Only VETERANS' advocates were able to successfully increase their share of the federal budget. At the same time, federal intervention in the RAILROAD SHOPMEN'S STRIKE, the establishment of a Federal Bureau of Investigation, whose primary tasks including surveillance of criminals and political radicals, and the institution of PROHIBITION revealed an increasingly powerful role for the executive branch in law enforcement.

Harding's successor, CALVIN COOLIDGE, held a similarly limited view of the powers and limitations of the presidential office. His administration focused on economic issues, promoting FOREIGN TRADE (see TRADE, FOREIGN), reducing federal taxes, and tending to international affairs, such as the KELLOGG-BRIAND TREATY and the DAWES PLAN. While there was robust growth in most sectors of the economy, AGRICULTURE was in crisis during the 1920s, and the continued weakness of mining and textiles contributed to economic instability, which the presidency largely ignored. By the mid-1920s, there already were signs of the economic downturn that led to the Great Depression. Neither Coolidge nor his successor, Herbert Hoover, grasped that the presidency's refusal to act in the face of economic troubles might have contributed to the emerging economic crisis.

### Progressive Party

The Progressive, or Bull Moose, Party was formed in 1911 by members of the Republican Party dissatisfied with the leadership of President WILLIAM HOWARD TAFT. The nation had changed rapidly between 1900 and 1912, becoming more urban, more industrial, and more ethnically diverse. Economic changes further complicated the picture as large national corporations began dominating entire industries, and class divisions threatened to undermine American democracy. Finally, numerous segments of society, including women, organized labor, minorities, and reform journalists had become increasingly active in politics. These changes resulted in substantial political turmoil, as the DEMOCRATIC and REPUBLICAN PARTIES struggled to understand and take advantage of this new landscape. Many believed that progressive and even radical reforms needed to take place if the nation was to remain unified and prosperous.

Progressive elements within the Republican Party had become convinced that President Taft was too conservative and unresponsive to demands for reform. They believed that the federal government needed to be more actively involved in regulating the economy and society. The roots of PROGRESSIVISM within the Republican Party can be traced to the presidency of THEODORE ROOSEVELT who, during his two terms in office (1901–09), had supported federal regulation of industry and promoted tax reform, labor law reform, and social legislation. Others within the party, particularly those in the urban North and Midwest, understood the appeal of progressivism and pushed the party in that direction. With Roosevelt's support, Vice President Taft won the Republican nomination and the general election in 1908. Once in office, however, Taft established strong ties with the party's conservative wing, the Old Guard Republicans.

Divisions began to emerge within the party as early as 1909 during debates on the PAYNE-ALDRICH TARIFF ACT. Wisconsin senator ROBERT LA FOLLETTE and other progressives were vehemently opposed to the tariff, because they believed that it kept prices artificially high and primarily benefited large industrialists and eastern financial markets. When Taft called for a special session of Congress to deal with the tariff issue, he planned to have them lowered; but the final version of Payne-Aldrich did the exact

opposite. When Taft signed the tariff and announced that it was “the best bill the Republican Party ever signed,” he created a split in the party.

Between 1909 and 1911, a series of controversies further deepened divisions in the party. Shortly after he took office, Taft refused to support progressives’ attempts to unseat the autocratic Speaker of the House, JOSEPH CANNON. In 1909 Taft fired GIFFORD PINCHOT, head of the U.S. Forest Service and longtime Roosevelt supporter, after he disagreed with Secretary of the Interior Richard Ballinger. In August 1910, Roosevelt delivered a speech in which he criticized Taft and laid out the idea of the NEW NATIONALISM that would provide the framework for his 1912 presidential campaign. Finally, in the 1910 elections, Taft and the Old Guard Republicans attempted to unseat or block the nominations of congressional progressives, convincing La Follette to form the National Progressive Republican League. He announced his candidacy for the Republican nomination in June 1911. Initially Roosevelt refused to publicly side with either Taft or the progressive dissidents; but when Taft overruled some of Roosevelt’s decisions, Roosevelt announced that he would seek the Republican nomination.

As president, Taft had complete control over the Republican Party machine. He was able to block challenges from both La Follette and Roosevelt, easily securing the Republican nomination. Convinced that they could defeat Taft and Democratic nominee WOODROW WILSON, dissidents in the Republican Party formed the Progressive Party. At their convention in August 1912 they selected Roosevelt as their presidential nominee and California governor HIRAM W. JOHNSON as their vice presidential candidate. The Progressive Party platform called for the abolition of CHILD LABOR, the creation of primary elections, the DIRECT ELECTION OF SENATORS, WOMAN SUFFRAGE, graduated income and inheritance taxes, limits on labor injunctions, an eight-hour workday, the use of collective bargaining in labor disputes, and the introduction of medical, retirement, and unemployment insurance.

The election of 1912 was tightly contested. The Progressives hoped they could lure enough votes away from both parties to secure a victory. In the end, while Roosevelt easily outpolled Taft, he failed to make significant inroads among Democratic voters to win. Wilson received 6,293,000 votes, Roosevelt 4,119,000, and Taft 3,484,000. The electoral vote was even more decisive, as Wilson received 435 votes to Roosevelt’s 88 and Taft’s 8. The Progressive Party attempted to maintain some semblance of unity and ran congressional candidates in 1914, but all besides Johnson were decisively defeated. By 1916, most Progressives were back in the Republican fold. When Roosevelt refused the party’s nomination in 1916, it endorsed Republican nominee CHARLES EVANS HUGHES. In the long run, the deci-

sion to break with the party in 1912 proved disastrous for liberal Republicans. Roosevelt had outpolled Taft, but the party had failed to create an independent political base. By the time progressive Republicans returned to the party between 1916 and 1917, the conservative Old Guard had complete control.

### **progressivism**

Progressivism, a loosely defined movement for social, political, and economic reform, gained political power and prestige during the first two decades of the 20th century. Progressives had a range of separate, even contradictory goals, which ranged from PROHIBITION, IMMIGRATION restriction, and the eradication of CHILD LABOR to a complete overhaul of the political and social system. To add to its complexity, the umbrella of progressive reform sheltered conflicting ideologies used by men and women to justify their actions. Generally, they embraced new ideas of social justice and social order, but there were tendencies that united the group. Progressives focused on reforming America’s political, social, economic, and moral landscape. They had a seemingly unending faith in progress and believed that, through rational development, they could foster a society of unlimited potential.

The degree to which Progressives believed in participatory democracy is unclear. Some sought to empower those on the lower rungs of the socioeconomic ladder. While many believed in defending members of society whom they considered powerless and in need of support, few progressives challenged fundamental tenets of the capitalistic system. They sought to work within the system to create a more socially cohesive, rational, and just society. For some, their activism was a way to defend and improve the system. For others it was a way to uplift the downtrodden and provide social justice.

Progressive reformers championed democracy as more than an ideal political system. They believed that devotion to the tenets of democratic life produced desirable economic and social effects as well. As a result, they sought to promote their vision of democracy both at home and abroad. At home, they sought to reform the political system and sponsored political checks and balances such as initiative, referendum, and recall. They also called for the secret ballot, the DIRECT ELECTION OF SENATORS, and the direct primary. To further spread democracy, progressives supported the enfranchisement of women. These, along with hundreds of smaller measures, helped to revolutionize

democracy at home. Progressives advocated the spread of democracy throughout the world, which culminated in WOODROW WILSON's Fourteen Points during peace negotiations after WORLD WAR I.

While few progressives dreamed of challenging the capitalistic system, many sought to make American capitalism more just and less costly in human terms. In an attempt to challenge the increasing power of the corporations, they sponsored legislation such as the Sherman Antitrust Act and the CLAYTON ANTITRUST ACT. Through these laws and other like measures, progressives sought to challenge the power of the large corporations. For the most part, however, these legislative acts did little to challenge the corporations' grasp on the political and economic reins of the American system. They often supported the status quo. Other forms of regulation such as the FEDERAL TRADE COMMISSION ACT were adopted in an effort to stem what was viewed as the uncontrollable growth of capitalistic enterprises.

As one wing of progressivism sought to regulate capitalist competition, another sought to develop the capitalistic model even more fully. Efficiency was the watchword. Progressives championed increased rationalization, and managers emerged to rationalize business and industry through SCIENTIFIC MANAGEMENT. Rationalization did not end at the corporation. Even cities underwent the transformation. In URBAN REFORM efforts, managers took on many of the roles that were previously reserved for elected officials. New laws that increased residency requirements for voting and instituted new election laws promoted selective democracy.

No aspect of the Progressive movement was more salient than the search for social order. Prohibition, which called for a ban on the production and sale of alcohol, was the grandest of the Progressives' attempts at ushering in an era of social harmony. Prohibitionists were convinced that if they could stem the flow of alcoholic spirits, they could promote a society with unlimited potential. They believed that an amendment that made the production and distribution of alcoholic beverages illegal would eliminate pain, suffering, and poverty. In another attempt to eliminate urban poverty, progressives promoted public projects such as settlement houses, which integrated new social reforms in urban immigrant neighborhoods. Settlement workers were pioneers in developing new techniques of SOCIAL WORK and proposed new programs to benefit the poor, such as MOTHERS' PENSIONS and WORKER'S COMPENSATION.

Progressive reform was furthered through a new type of JOURNALISM. Professional journalists, known as MUCKRAKERS, wrote exposés of social problems. They were nicknamed muckrakers due to their propensity to rake up the economic, political, and social muck that others chose to ignore. Jacob Riis began as a photojournalist in New

York. It was there that he first witnessed the torments of the city. Riis's exposés told the story of "How the Other Half Lives." Riis was one of the most renowned, but he was far from the only muckraker of the era. UPTON SINCLAIR, LINCOLN STEFFENS, IDA TARBELL, and others kept the social inadequacies of American urban life at the forefront of newspapers.

Progressivism had its darker side. In the search for social order, many turned to reforms that would restrict access to political rights, narrowly define citizenship, and regulate private behavior. Advocates of immigration reform helped write and pass such laws as the IMMIGRATION ACT OF 1917, the QUOTA ACT of 1921, and the NATIONAL ORIGINS ACT of 1924, which greatly restricted the entry of new immigrants from southern and eastern Europe. In seeking to rationalize American citizenship, Progressives implemented their own racial, ethnic, and gendered views of what constituted true American democracy.

Progressivism developed into a full-blown political movement. The first PROGRESSIVE PARTY, known as the Bull Moose Party, was founded after a bitter fight for the Republican presidential nomination between the more moderate incumbent, President WILLIAM H. TAFT, and THEODORE ROOSEVELT. At the Republican convention in June 1912, the nomination went to Taft. Unable to accept Taft's conservatism, Roosevelt helped to form the Progressive Party, which nominated him for president and the California governor HIRAM W. JOHNSON for vice president. Throughout the 1912 election, the tensions and divisions present in progressivism surfaced between Wilson's NEW FREEDOM and Roosevelt's NEW NATIONALISM. While the Progressive Party garnered more support than the Republicans in the election, the end result was a victory for the DEMOCRATIC PARTY's candidate, Woodrow Wilson.

Wilson's election marked a shift to a new visibility for progressive reform. He came to embody many of the ideals of the Progressives. He called for a country and a world that was "Safe for Democracy." In 1924 a liberal coalition, frustrated with conservatives in both major parties, formed the League for Progressive Political Action, also called the Progressive Party. The party nominated Senator ROBERT LA FOLLETTE for president and Montana Democratic senator Burton K. Wheeler for vice president. The party drew considerable support from left-wing progressives, socialists, and Farmer-Labor advocates. Many of its most committed members were socialists. They argued for government ownership of public utilities and labor reforms such as the right to collective bargaining. CALVIN COOLIDGE overwhelmingly defeated La Follette, who polled a respectable 4.8 million votes; he captured about 16.5 percent of the total ballots cast and 13 electoral votes.

This campaign was the final hurrah of the progressive movement. With the disenchantment that followed World

War I and the deficiencies in social policies such as Prohibition, many Americans abandoned the crusading ideals of progressivism. But its legacy lived on in the careers of progressive reformers and in the New Deal, which brought about many of the reforms progressives had sought.

## Prohibition

Prohibition, the law that made the sale, production, and distribution of alcohol a crime, was one of the most profound social experiments in American history. Its proponents viewed it as a means of achieving true social enlightenment. They championed it as a way to attain political and social perfection through the elimination of suffering, poverty, and hardship. For its opponents, Prohibition was an attack on the rights of the individual. It was an overly aggressive attempt by the government to impose legal restrictions on private behavior. Regardless of perspective, Prohibition was an effort to fundamentally alter American political and social life.

Many Americans viewed alcohol use and abuse as an affront to the political system. While alcohol consumption was not confined to men, drinking became an important part of American men's personal and political identity. In the early decades of the 19th century, the connection between drinking and democratic citizenship grew to reinforce the maleness of both drinking and political activity. As a result, by the middle of the century, drinking and voting were combined into a single event—a celebration of political masculinity. Political and social reformers alike perceived this link between alcohol and democratic life as a real threat to the nation. Many of these concerned citizens viewed the saloonkeeper, who often functioned as a link between the political and social life for most immigrants, as a true enemy of society. Some social reformers came to view the saloon as the devil's headquarters on Earth. These views provided prohibitionists with ample weapons to attack not only the saloon, but also drinking in general.

No two organizations were more important in bringing about the passage of Prohibition than the Women's Christian Temperance Union (WCTU) and the Anti-Saloon League (ASL). The WCTU viewed drinking as a moral

abomination that demeaned men, threatened women, and destroyed the family. The WCTU was extremely successful in popularizing the idea of a national prohibition amendment, but it was the ASL that bolstered the final drive toward national Prohibition. Howard Russell, the founder of the organization, noted that the league was more than the male counterpart of the WCTU. Many of its members believed that the WCTU relied too heavily on moral suasion and did not place enough focus on the enforcement of laws that were already in place. The ASL, in contrast, was a modern organization that benefited from a coherent business structure. In addition, its attacks on drinking were not strictly from a moral position. Its leaders challenged demon rum on a legal front. They began by demanding the enforcement of laws that were already on the books. Only later, when liquor dealers openly flaunted these laws, did they attempt to bring about national Prohibition.

WORLD WAR I provided the opportunity for which opponents of the saloon were looking. They used the war to challenge the saloon on two fronts. On the one hand, they claimed that brewers and distillers were wasting needed war supplies in the pursuit of profit. On the other hand, they challenged the loyalty of the predominantly German brewers. Against the wishes of President WOODROW WILSON, Congress in 1918 passed the Wartime Prohibition Act, banning the manufacture of beer and wine beginning in May 1919 and intoxicating beverages after June 30, 1919. It was to remain in effect until the end of hostilities. This vague terminology allowed the ban to be stretched out until formal Prohibition was adopted.

On the heels of wartime Prohibition, national Prohibition would be implemented. On December 18, 1917, Congress approved a constitutional amendment to prohibit the production, distribution, and sale of alcohol. Once again, the president opposed in vain, and the act was passed over his veto. President Wilson believed that the act's definition of intoxicating beverages—any beverage containing more than 0.5 percent alcohol—was too strict. He believed in the goal of the amendment, but he had his reservations about such a strict definition of alcoholic spirits. He was in favor of a law that allowed for the casual use of weaker wines and ales. His veto proved to be nothing more than a symbolic gesture.

Overriding the president's veto was only the first step toward amending the Constitution. The next step was winning approval in the states. At first it was believed to be a daunting task. But upon further assessment, it was not as difficult a task as once predicted. The Women's Christian Temperance Union, the Anti-Saloon League, and dozens of other pro-Prohibition organizations had been developing the local networks necessary to win support in the states. Twenty-five states already had dry laws. Prohibition forces received a boost when Detroit became the first large city

Law officials raid a cellar during Prohibition. (*Library of Congress*)

to support the amendment. State by state, the amendment was ratified. On January 15, 1919, New Hampshire became the 36th state to ratify the amendment. One year later, on January 20, 1920, the law took effect.

One of the primary shortcomings of the Prohibition amendment was that it proved difficult to enforce. The concurrent enforcement from the states and federal government allowed both the federal and state governments to leave enforcement of the act to the other. In open defiance of the Volstead Act, the legislatures in New York, New Jersey, and Massachusetts passed laws in 1920 allowing for the production and sale of low-alcohol beer and light wines. Later in the same year, through national Prohibition cases, the Supreme Court crushed these efforts and set alcohol limits at .05 percent. These decisions did not win the support of reluctant states. Challenging the federal government, a number of states decided not to enforce national Prohibition.

In addition to problems with enforcing national Prohibition, criminal syndicates emerged to profit from the traffic in illicit spirits. Instead of decreasing criminal activity and misery, Prohibition seemed to be promoting criminal activity. Al Capone in Chicago, George Remus in Cincinnati, and dozens of other underworld figures made millions

bootlegging illicit spirits. It sparked considerable violence. In Chicago alone, between 1920 and 1930, nearly 550 men were killed by rival gang members, while police killed hundreds of others during the era. These murders began to capture the attention of the American public. Gangsters, not liquor, became public enemy number one.

The saloon of the pre-Prohibition era had been viewed as a den of evil. What emerged in its place during Prohibition had a far less ominous reputation. The speakeasy came to supplant the local tavern. The speakeasy quickly gained a reputation for being a place where Americans went to have a good time. Even though it was illegal to frequent these establishments, going to a speakeasy was viewed as a victimless crime. Patronizing speakeasies was increasingly viewed as an innocent way to challenge the unjust law. Along the way, women joined in the rebellion.

In the years that led to the passage of the Eighteenth Amendment, women had been making slow but steady progress toward eroding the strictly male identity of the tavern. Women were demanding and, in some cases, receiving access to drinking establishments, but they were far from attaining an equal place within this male bastion. When they were admitted, women often needed to enter through “women’s entrances,” while only “questionable”

women entered drinking establishments without male escorts. With the adoption of the Eighteenth Amendment, women's slow encroachment became a full-scale frontal assault. The emerging speakeasy came to represent something that was risqué but not necessarily immoral. And women increasingly found the doors to the speakeasies open. As women began to frequent the local speakeasies in greater numbers, they helped to redefine gender and drinking roles. Simultaneously, women were less domesticated and drinking more.

The Great Depression, more than any single event, challenged the future of Prohibition. For many Americans, Prohibition not only failed to end drinking, crime, or violence, it also failed to deliver on the promise of a more prosperous nation. In the depressed economic climate of the early 1930s, men and women were tired of devoting needed resources to fighting demon rum. They also wanted the added revenue that a revitalized alcohol industry might foster. The Association against the Prohibition Amendment (AAPA) and the Women's Organization for National Prohibition Reform (WONPR) had launched a serious challenge to Prohibition. Pauline Sabin, one of the leading forces behind WONPR, referred to herself as a "reformed Prohibitionist." She claimed to support the ideals of Prohibition but challenged the methods. She helped to promote that idea that it was acceptable for women to oppose Prohibition. By the middle of the 1920s, the AAPA had companies like General Motors and Standard Oil supporting them. Few predicted the repeal of national Prohibition. Morris Sheppard of Texas went as far as to note that, "There is as much chance of repealing the Eighteenth Amendment as there is for a humming bird to fly to the planet Mars with the Washington Monument tied to its tail." But after 13 years of the noble experiment, Americans decided that it was time for it to end. They repealed national Prohibition.

In some ways, the failure of Prohibition is a myth. Prohibition did reduce alcohol consumption in America. Whether due to Prohibition or not, drinking did not return to its pre-Prohibition levels until the 1970s. Most perceptions of Prohibition's shortcomings are based on its overly inflated objectives. It did not do what many had hoped. It did not wipe alcohol from the American landscape, nor did it end poverty and suffering. But it is difficult to imagine a scenario where Prohibition could have lived up to its promise. What is clear is that Prohibition was successful in putting an end to the reign of the old-time saloon. The drinking establishments that emerged in the wake of Prohibition were no longer the "Devil's den on Earth" that they had once been.

## public health

"The golden age of public health" dawned at the beginning of the 20th century. As social reformers and public officials increasingly accepted environmental and epidemiological factors as the causes of the commonly fatal diseases of tuberculosis, diphtheria, typhoid fever, and cholera, they turned toward medicine for the answer. Directing new attention toward epidemic disease and educating the public in social hygiene, states abandoned the old practice of politically appointed public health officers and instead relied on medical experts to establish new rules and procedures to protect public health. City and state governments created boards of health to intervene in epidemics and regulate sources of contagion and disease, such as water supply and sewage systems, commercial milk production, and workplace ventilation. They also strengthened their efforts to immunize children against ailments such as diphtheria, to quarantine affected populations, especially immigrants, and to treat infectious diseases such as tuberculosis through isolation in public sanitariums.

There was tension, however, between public health officials and the private practice of MEDICINE. In every attempt to open up public health services, whether in private maternity hospitals, public schools, or community clinics, the new power of the American Medical Association (AMA) made itself felt. Even as medical knowledge and practice expanded, the AMA's ability to lobby for new state licensing boards and higher standards of medical education stymied lay practitioners. Its growing control over prescription drugs and medical treatment also made itself felt. By the end of the 1920s, the medical profession had been able to turn public health programs from a threat to private practice to an indirect subsidy for private physicians.

Epidemic disease, however, was the one area in which public health reigned. The principal reason why governments gave new powers to public health departments was the medical discovery of the origin, course, and treatment of such diseases as tuberculosis and diphtheria. The importance of factors such as exposure to disease in the spread of contagion, and the impact of the urban environment, required new public measures. Successful treatment of these two diseases alone promised a decline in the mortality rate, as they were among the leading causes of death in the late 19th and early 20th centuries.

Campaigns to control tuberculosis led the way. In 1904, the National Association for the Study and Prevention of Tuberculosis took steps to conduct studies, educate the public, and broadcast findings about the disease. Local and state campaigns followed. A leader in this effort was the state of New York, where the State Charities and Aid Association formed a Committee for the Prevention of Tuberculosis. New findings about the contagious nature of the disease led to a demand for greater reporting and oversight, and in 1908, the New York state legislature passed a law mandating that physicians report tuberculosis cases. While it was rescinded, reporting on the disease increased; and overall the rate of infection slowed incredibly between 1907 and 1917. Improved nutrition, better general health care, and the pasteurization of milk provided a context for the decline of tuberculosis. Isolation of tuberculosis patients in newly established state sanitariums stopped the epidemic spread of the disease and forced a decline in tuberculosis as one of the major causes of death. Within the sanitariums themselves, the period saw little change in cure rates, as medical practitioners continued to experiment with treatments. The better food, fresh air, and personal rest that were offered to minimally infected patients probably aided their recovery, while the severely ill tended to die in isolation from their families.

The creation of the United States Public Health Service in 1902 was emblematic of new trends in public health and medicine. The United States had been slow to create a public health agency because, unlike European industrial states, the federal government had a vested interest in relying on private health care. Congress had created a National Board of Health in 1879 but abolished it only four years later. In 1902 and 1912, Congress finally expanded the Marine Hospitals for seamen into the Public Health Service. It also took on medical research and care in the area of OCCUPATIONAL HEALTH AND SAFETY, although it remained tied closely to manufacturing concerns in its work. For the most part, however, it left medical authority in the hands of local and state governments and private organizations. Voluntary associations such as ethnic benevolent societies, fraternal organizations, unions, and private employers provided some measure of health care and diagnosis. Health insurance, even in the private sector, was underdeveloped. And dispensary medicine, long the refuge of the poor, was under siege from private medical doctors.

During the period, public health officials directed attention to those areas of public health shunned by private practitioners. They addressed the spread of sexually transmitted diseases such as syphilis (Paul Ehrlich invented salvarsan, for treatment of syphilis, in 1910; although only partly effective, it became available through public venereal disease clinics) and created new, if largely ineffective, laws

Demonstration at the Red Cross Emergency Ambulance Station in Washington, D.C., during the influenza pandemic of 1918 (*Library of Congress*)

that regulated or prohibited prostitution. During WORLD WAR I, concern over venereal disease led to increasing control of towns around military bases, sex education in military training, and the increased use of condoms. The war generally increased the willingness to allow state and federal interventions in public health matters.

The Influenza Epidemic of 1918–19, or Spanish Flu Epidemic, was a proving ground for the new powers of the state to regulate public health. Viewed in total numbers of lives lost, it was possibly the most devastating epidemic in history and claimed more than 25 million lives worldwide in a relatively short period of time. At least 12,500,000 people died in India alone; in Samoa 25 percent of the population perished in the epidemic. The magnitude of loss throughout the United States was such that some towns were decimated. The sudden onset of the flu, rapid loss of life, and the quick disappearance of the disease revealed the limitations of medical knowledge and public health measures as the disease spread rapidly and without any certain treatment.

There were three distinct waves to the outbreak of the epidemic. The first wave was thought to have originated in Kansas in March 1918. The cases were comparatively mild, and few Americans paid much attention to it. There were other, more pressing considerations at the time. The war in Europe, the TREATY OF VERSAILLES, and the RUSSIAN REVOLUTION captured the headlines more than the outbreak of flu. The second wave of cases, however, caused greater alarm. During the hot summer months, a lethal strain of the Spanish flu virus emerged. This more deadly strain worked extremely fast. It raced through both city and countryside. Unlike its relatively mild predecessor, this

virus brought pneumonia soon after the initial infection. The flu strain struck the armed forces and the civilian population hard. The third and final wave of the flu surfaced the following winter, when it cost millions of citizens their lives. It was more deadly than either of its predecessors. It disappeared, however, as fast as it had appeared. By spring, the epidemic had run its course. The social effects of the epidemic were pronounced. Unlike most flu outbreaks, which affect the young and the aged, nearly half the victims of the Spanish Flu were men and women between the ages of 20 and 40. The epidemic thus added to the losses endured during WORLD WAR I. The wildfire spread of the flu also brought new caution to a medical field that could no longer know with certainty that infectious diseases could be cured. Epidemic disease revealed the real limitations of the nation's health care delivery system.

Another area of weakness was in the provision of medical care for war VETERANS. Over 300,000 veterans had returned from the war in Europe in need of care in hospitals, sanitariums, and asylums. Prior to the war, the U.S. Public Health Service had no responsibility for providing military health care. In 1919, however, Congress assigned the Public Health Service responsibilities for veterans with service-related disabilities, including tuberculosis, neuropsychiatric disorders, and general medical and surgical cases. Given the lack of facilities, the PHS opened to veterans the 20 marine hospitals under its supervision and leased other hospital facilities from the army and navy, bringing the number to 62 hospitals. Even these were inadequate to care for the thousands of disabled veterans. In 1921, under the administration of WARREN G. HARDING, Congress passed the first Langley Act, which authorized \$18.6 million for veterans' hospital construction. It was in this period of time that veterans' medical care was moved from the Department of the Treasury to the VETERANS BUREAU. Medical care for disabled veterans had become a major investment in the public health care system.

In the case of pregnant mothers and young children, the health care system was engaged in an experiment with government-funded medical education. The interest of progressives in child welfare, evidenced in the creation of MOTHERS' PENSIONS, became the focus of women's organized efforts for a national health program under the Maternity and Infant Health Care Act, or SHEPPARD-TOWNER ACT, of 1921. Under the authority of the CHILDREN'S BUREAU, the program helped to nurture the public health nursing service and generally contributed to the continuing decline in infant mortality. Congress allowed the funding of the controversial program to expire in 1929. Competition between Public Health Service doctors and the nurse practitioners who provided health care under the Children's Bureau program had shadowed the program from the beginning.

The same competition that plagued publicly funded maternity and infant child care was an issue in the provision of BIRTH CONTROL as well. Between 1900 and 1920, radicals such as MARGARET SANGER and EMMA GOLDMAN battled for the right of poor women to have access to new birth control methods and safe abortions. Many in the medical profession, however, opposed methods of contraception both for reasons of personal belief and due to a lack of medical regulation. Sanger pushed for the adoption of the spring-loaded vaginal diaphragm, which she originally argued should be available at neighborhood clinics and from nurse-midwives. Seeking to pave the way for easily accessible birth control, Sanger eventually allied herself with the medical profession in creating Planned Parenthood, an organization dedicated to motherhood by choice. Not until the 1930s, however, did she succeed in getting birth control and fertility seen as a public health concern. By then, the medical profession had succeeded in limiting public health initiatives and expanding its role even in the provision of health care to the general public.

### Pure Food and Drug Act (1906)

Changes in the manufacturing, processing, and distribution of goods and services fundamentally altered the nation's food supply and the way in which food was prepared. Gone were the days when food was grown, cultivated, and sold locally. By the first decade of the 20th century, much of the food supply for urban America was grown at some distance, shipped in bulk, and sold at markets or grocery stores. Food producers learned lessons from the automobile industry and increasingly began producing food in mass quantities. This food was then shipped in newly designed, refrigerated train cars and trucks. Technological innovations also allowed food manufacturers to produce canned goods. These innovations came with mixed blessings. The price of food declined steadily while the supply and variety of food increased substantially. However, because it was largely unregulated, the quality of the nation's food supply declined as food purity frequently took a back seat to reducing costs.

The alarming conditions of food production were first exposed in muckraking journalist UPTON SINCLAIR's *The Jungle* (1906). In 1904, Sinclair was commissioned to investigate the living and working conditions of the largely foreign-born workers in the Chicago meatpacking industry.

What Sinclair found was published in his book *The Jungle*. Sinclair's intent had been both to alert the public to the appalling lack of sanitation and to expose the low wages, hazardous working conditions, and substandard living conditions of the Chicago stockyard workers and their families. Although Sinclair would later complain, "I aimed at the public's heart and by accident I hit it in the stomach," *The Jungle* had a tremendous impact on an already wary public.

Concern about drug abuse and the purity of food products had been mounting since the 1890s. Dr. Harvey Wiley, the head of the Department of Agriculture, formed a "poison squad" to test food for chemical additives; and the American Medical Association, concerned that pharmaceutical drugs were being mislabeled and sold as health tonics, lobbied for the introduction of strict federal oversight. Intense lobbying on the part of progressive reformers and the medical community along with growing public

concern prompted President THEODORE ROOSEVELT to order investigations into the meatpacking and pharmaceutical industries. These investigations resulted in the passage of the MEAT INSPECTION ACT (1906) and the Pure Food and Drug Act (1906). The Pure Food and Drug Act established strict controls on food and drug labeling and placed oversight responsibility with the Department of Labor, the Department of Agriculture, and the Department of the Treasury. The act has been extended and strengthened numerous times since 1906, most notably in 1938 when the Food and Drug Administration was created.

### Quota Act (1921)

The Quota Act of 1921 was the culmination of 25 years of lobbying for restrictive immigration laws. Through much of the 19th century, the United States had an “open door” immigration policy, which had allowed individuals and families to enter the country with relatively few restrictions. As the economy of the United States became more concentrated in urban areas and focused on industrial production, the volume of migrants steadily increased. The growing number of immigrants in urban centers quickly became an issue of concern and gave rise to a vocal anti-immigrant movement. Although CONGRESS moved to restrict the entry of Asian immigrants, particularly those from China, as early as 1882, it was not able to enact legislation that closed the door to immigrants from Europe prior to WORLD WAR I. Indeed, with steady improvements in transatlantic transportation, European migrants were able to reach the United States in ever-increasing numbers. In 1882, some 788,922 immigrants entered the United States, and 1,285,349 entered in 1907. Not only did the volume of immigrants steadily increase, but the countries of origin for immigrants dramatically shifted as well. New immigration from southern and eastern Europe predominated.

World War I brought a precipitous drop in the number of immigrants arriving in the United States, but the volume of people seeking entry quickly returned to near prewar levels following the cessation of hostilities in Europe. By 1921, some 800,000 immigrants had sought entry to the United States, and the proportion of southern and eastern Europeans among them remained high. In 1917, Congress had enacted a literacy test in the hope of restricting the entry of immigrants to the United States in the IMMIGRA-

TION ACT OF 1917. Within only a few years, it became clear that this legislation would not have the desired effect. Accordingly, Congress moved to the next step and put into place legislation that limited the number of immigrants eligible to enter based on country of origin and the total number of immigrants that the United States accepted annually. The Quota Act of 1921 limited the annual number of entrants of each admissible nationality to 3 percent of that foreign-born nationality as recorded in the official census of 1910. The intended purpose of this legislation was to control the influx of immigrants. Immigration restrictionists thought that this legislation would effectively close the door on emigrants from southern and eastern Europe, who had quotas set at less than one-quarter the annual volume of immigration prior to World War I. Under this legislation, Congress continued to allow free emigration from its neighbors in the Western Hemisphere. Between 1907 and 1914, the average annual emigration from countries in northern and western Europe was nearly 177,000 while the same figure for emigrants from countries in southern and eastern Europe slightly exceeded 685,000. With the passage of the 1921 Quota Act, the volume and origins of immigrants to the United States dramatically shifted. Some 198,000 emigrants entered in 1922 from northern and western Europe, while only a little better than 158,000 emigrants from southern and eastern Europe were able to gain entry to the United States.

### race and racial conflict

During the first decades of the 20th century, Americans significantly changed the way they thought about race. At the turn of the century, many believed that numerous distinct races existed. They categorized Scandinavians, Slavs, Japanese, Germans, and Irish as separate races. By 1930, the modern conception of race based on skin color had developed, and all groups of Europeans were now defined as white. Because racial categorization depended on political, legal, and social boundaries between recognized races, changes in how race was categorized involved recognizing and maintaining new boundaries. Part of this change involved violence between whites and African Americans as whites tried to distance themselves from African Americans. At the same time, intellectuals shifted the terms of the debate about racial differences from biology to culture.

In the United States socially and politically powerful groups imposed racial categories for the purpose of maintaining their own power. Members of the dominant racial group enjoyed greater access to the benefits of American society, benefits that differed only by gender. Even before the modern racial categorization based on African ancestry developed, race was thought of in terms of color. The police and the courts were open only to white Americans. The best jobs were open to them. They could send their children to the best schools. Whites' votes gave them a say in the political and economic arenas. Asian immigrants and Native Americans were consigned to a category outside citizenship, and to be considered black meant being shut off from all or most of these opportunities. At the turn of the century, not all Americans of European ancestry were believed to be white. New immigrant groups were categorized as black, meaning they were not deemed worthy of the benefits enjoyed by the dominant racial group. Only after they had suffered through a probationary period, in which their worthiness for full citizenship was evaluated, did they gain access to broader social and political rights. It was not unusual in the 1850s, for example, to refer to Irish Ameri-

cans as blacks. Once an immigrant group gained political and economic power, it eventually was seen as white. It was not, however, until the 1920s that all Europeans, regardless of their country of origin, fell into that category.

Before that time, immigrants were categorized according to their country of origin. As IMMIGRATION to the United States increased in the late 19th and early 20th centuries, whiteness was fractured into a myriad of scientifically defined races. The immigration laws specifically allowed only "white persons" to enter the United States freely. Laws such as the Chinese Exclusion Act of 1882 and the GENTLEMEN'S AGREEMENT of 1907 restricted Asian immigration. People from these groups were not eligible, therefore, for even a probationary status in the eyes of white Americans. Despite the perceived inferiority of many groups, the exclusion of Asian immigrants gave every European immigrant some claim to whiteness. Many members of the socially and politically powerful groups within American society expressed the fear that immigrants, particularly those from southern and eastern Europe, threatened to dilute the purity of the white race. This fear led to a system of racial classification in which physical, mental, and emotional characteristics were attributed to individuals based on their nationally defined race.

The attempts of some Americans to redefine racial categories led to a debate over the nature of race. On one side were proponents of the pseudo-science of eugenics. Eugenics revolved around efforts to classify individuals into racial categories and to rank those races according to a set of criteria that favored northern Europeans. Many believed that Italians and Jews, for example, could be identified by their physical characteristics. Eugenicists used these racial classifications to argue that the whites were committing "race suicide" by allowing southern and eastern Europeans to settle. Eugenicists argued for changes in population policy, which ranged from sterilization of the poor and disabled to harsh anti-immigration measures. In his extremely popular 1916 book, *The Passing of the Great*

*Race*, Madison Grant argued that the American melting pot was creating a lower race of people, as southern and eastern European immigrants bred with native-born white citizens. In opposition to the eugenicists, anthropologists such as MARGARET MEAD and FRANZ BOAS demonstrated that perceived differences among races were products of historical circumstance, not products of inherent physical and mental characteristics. Sociologists at the University of Chicago such as Robert Park also defied the efforts of eugenicists.

Among the general public and policy makers, the eugenicists' view of race predominated. As early as 1911, the DILLINGHAM COMMISSION reported that the immigrants coming to the United States were different from earlier groups. It recommended that immigration from eastern and southern Europe be restricted. In coming to its conclusion, commission members ignored most of the data they collected to report, instead, preconceived findings. The commission's recommendation gained the force of law in the 1921 QUOTA ACT and the 1924 NATIONAL ORIGINS ACT, which established quotas that severely limited emigration from southern and eastern Europe. The new law had the effect of removing the threat of inferior white races, which allowed the immigrants and children of immigrants to gain white status. As all European Americans became white, the only racial distinctions remaining were those between whites and those defined as "other," specifically African Americans, Asian Americans, NATIVE AMERICANS, and, to a lesser extent, Hispanics. Thus, modern racial relations based on skin color developed.

As members of the few racial groups in the United States that never had the opportunity to become white, African Americans, Asian Americans, Native Americans, and Hispanics faced new efforts at codifying and strengthening racial discrimination. In this effort, many European Americans stressed the differences between themselves and African Americans, for example, through the ideology of white supremacy and the practice of SEGREGATION. Supporters of the idea of white supremacy developed the argument that non-European Americans were innately inferior to whites. At a time when mass-production industry was playing a larger role in American life, white supremacists constructed an image of African Americans, Native Americans, and Hispanics as pre-industrial and irrational peoples. In this scheme, whites were seen as rational for adopting time clocks in determining the pattern of their days. Eugenicists bolstered these arguments with purported scientific "facts" that non-Europeans belonged to more ancient, less developed racial groups. In the minds of many, if non-Europeans were not quite human, they did not need to be treated as such. Many proponents of education for non-European Americans, for example, argued that they required only a basic education that focused on rudimentary vocational skills.

In the Southwest, many of the same ideas were applied to Hispanic and Native American peoples, just as in the West, Asian Americans were viewed as products of a feudal society.

One outgrowth of white supremacy was the violation of non-European Americans' civil, political, and social rights through segregation, or the physical and legal separation of the races. The most systematic efforts to legislate racial prejudices came in the southern states. Beginning in the late 19th century, southern states launched an attack on African Americans that resulted in the passage of a myriad of oppressive laws known under the name of Jim Crow. By 1900, most southern states had passed laws restricting the voting rights of African Americans. The laws established either a property or literacy requirement for voting and then created loopholes through which white voters could vote. Most states also required payment of a poll tax.

After taking African Americans' voting rights, the southern states passed countless laws restricting the social and economic rights of African Americans. By 1910, every southern state had segregated railway stations in which African Americans and whites waited in separate rooms. Between 1901 and 1907, 10 states segregated their streetcars and trains, requiring African Americans to sit in the rear. States segregated hospitals, prisons, and parks. Theaters established separate entrances and seating areas. Even workplaces became segregated. A 1915 South Carolina law, for example, prohibited the races working together in the same room and required separate entrances, pay windows, doorways, toilets, and drinking water.

By 1920, 30 states had outlawed racial intermarriage. Most of these laws pertained to marriage between whites and blacks, but some states outlawed marriage between other racial groups. In 1905, for example, California outlawed marriage between Asians and whites. The movements to prohibit racial intermarriage led to the establishment of the "one-drop rule" of racial identification, which held that if a person had any ancestor considered to be of African descent, then they were considered black under the law. Some states also imposed the one-drop rule for Native American ancestry. The nature of race as a social construction was demonstrated in the 1924 Virginia Racial Integrity Act. The Virginia legislature established a "one-drop" law for determining African ancestry and outlawed all racial intermarriage. The legislature also sought to prohibit marriage between whites and Native Americans, originally proposing a "one-drop" law. A number of legislators and prominent citizens, however, traced their lineage to John Rolfe and Pocahontas. Any "one-drop" law would have applied to them. They therefore changed the law to allow citizens with up to one-sixteenth Native American ancestry to be considered white.

A complex racial etiquette accompanied the legal restrictions. In California, Japanese men were expected to be docile and deferential to whites. In the southern states, whites expected African Americans to demonstrate their inferior status by deferring to whites in public. African Americans were not to look whites in the eyes. When walking on the same sidewalks, African Americans were to move into the road to allow whites to pass. Southern whites reserved a special place in the racial etiquette for the relationship between African-American men and white women. A mythology surrounding African-American men existed in which they were supposedly interested in nothing but ravaging white women. These beliefs were spread through word of mouth and the new media of motion pictures. In 1915, the film, *The Nigger*, showed an African-American man attacking a white woman. D. W. GRIFFITH's film, *BIRTH OF A NATION*, claimed to tell the true story of Reconstruction in the South after the Civil War. Of special note was its portrayal of African Americans with white ancestry. Mulattoes, as they were known at the time, supposedly wanted what white men had—power and white women. The film included scenes of mulatto men degrading white women. The creation of the Jim Crow system was dedicated, many believed, to preserving the purity of white southern women.

The system of racial etiquette was backed by force. Any African American who violated the cultural rules faced punishment ranging from severe beating to death. A lynching was a mob action in which a group seized a person believed to have committed a crime and committed an extralegal murder by shooting or hanging the victim. Often the mob attacked and defaced the corpse. Between 1880 and 1930, white mobs lynched approximately 3,220 African Americans in the southern states. Sporadic lynching occurred in other regions as well. In the early 20th century, Japanese men faced beatings on the streets in California. Many African Americans in the South lived in fear that the slightest transgression could lead to death.

African Americans did not always stand idly by as they were attacked. In many instances, they fought back. In 1900, a New Orleans man refused to surrender to the police after an altercation with a white man. He ended up killing 10 white people before the police shot him. In 1906, African Americans in Mississippi took up arms on two separate occasions to defend themselves. The same year, whites in Atlanta were incited to riot by newspaper articles that alleged mobs of African-American men were roaming the city attacking white women. The whites took to the streets and began randomly to attack and murder African Americans. When the mob moved into the African-American neighborhood, blacks organized to defend themselves and killed several of the invaders.

Racial violence was not confined to the South. Race riots occurred in 1900 in New York City and Akron, Ohio. In

1908, white mobs took control of Springfield, Illinois, and attacked African Americans and their property. Racial violence in the northern states intensified after WORLD WAR I. African Americans had migrated to the northern cities in great numbers during and after World War I in the GREAT MIGRATION—with two effects. First, the growing populations of African Americans pushed against the boundaries of segregated neighborhoods. There was not enough housing in the traditional African-American areas, and migrants from the South sought housing in areas that whites saw as their own. Often an attempt by an African-American family to move into a new neighborhood led to an attack by whites. In Chicago between 1919 and 1921, for example, there were 58 bomb explosions, almost all of them related to African-American housing. Conflict erupted over control of other public spaces such as parks and beaches. One of the worst riots started when an African-American youth swam across the dividing line between black and white sections of a Chicago beach. Second, the African-American migrants came with the hope of securing an industrial job. Many white workers saw them as a threat. The use of African Americans as strikebreakers contributed to these anxieties, and economic crisis intensified white fears. An additional factor was the new, militant attitude of some African Americans returning from military service. They began to demand the rights and opportunities for which they had presumably fought.

All of these factors combined led to an outbreak of racial violence in the years immediately following the First World War. In the last six months of 1919, 25 separate incidents of racial violence erupted. In Chicago, conflict at a public beach flared into a riot that lasted almost a week and resulted in 38 deaths, 23 of which were African American. Countless others were injured and substantial amounts of property were damaged. In East St. Louis in 1917, tensions ran high over competition between African-American and white workers. On the night of June 30, 1917, a fight led to the shooting of a white policeman by an African American. White crowds gathered to avenge the police officer's death and attacked African Americans. Nine whites and 25 African Americans were officially counted as dead, but officials believed that more African Americans had died in fires set by attackers. In Tulsa, Oklahoma, in 1921 whites assaulted the African-American section of the city, burned most of it to the ground, and killed anywhere from 20 to 60 African Americans.

Ironically, racial violence peaked just as anthropologists such as Franz Boas presented new challenges to scientific racism. Still, these incidents of racial violence took place during a time of change in the way race was perceived in the United States and were partially the result of white American attempts to redefine themselves. Only with the broad changes in society and politics in the years between

the wars did movements for racial equality begin to change Americans' perception of race.

### Racial Integrity Act (1924)

A widely known and enforced ban against racial intermarriage, the Racial Integrity Act was a Virginia law passed in 1924, which required that the race of all persons born in the state be recorded at birth and registered on marriage certificates. Most infamously, the law made marriage between “white persons” and nonwhites a felony offense. The Racial Integrity Act was passed at the same time as another important law, the Sterilization Act, which provided for the sterilization of individuals who were classified as “feeble-minded.” Inspired by the EUGENICS movement, these laws were designed to keep the population racially pure and to restrict the childbearing of the “unfit.” The Racial Integrity Act further acted in tandem with state laws of SEGREGATION, providing for the biological separation of one race from another.

The early 20th century witnessed the rise of eugenics as a supposed SCIENCE of human reproduction and heredity. Inspired by the work of Francis Galton, the goal of the eugenics movement was social engineering—to eliminate the hereditary weaknesses that supposedly led to lower intelligence, criminality, and poverty through selective reproduction. The popularity of eugenic ideas in the United States led to several state laws that prescribed sterilization for the feeble-minded and/or banned interracial marriage. Virginia's was not the first such law. By 1924, 15 states had similar legislation. The Racial Integrity Act, however, became the most strongly enforced law in the nation.

Dr. Walter Ashby Plecker, the Virginia registrar of vital statistics, played a central role in developing the racial criteria of the Act. The law required that any individual with even one drop of nonwhite blood be legally registered as

“colored.” While it made an exception for those who were as much as one-sixteenth Native American, a tribute to elite families' claim of descent from Pocahontas, the racial categories effectively masked the heritage of many Virginians of Native American birth and excluded them from federal recognition of Indian tribes. Despite political pressure to soften his stand on Native Americans, Dr. Plecker as state registrar vigorously enforced all the provisions of the law and even, by his own admission, exceeded his authority when he forced the exhumation and reburial of those of questionable racial heritage from white cemeteries.

The lasting effects of the Racial Integrity Act cannot be known, but the ban on interracial marriage clearly forced many interracial couples into clandestine marriages or migration to other states. Still, it was only in the context of the Civil Rights movement and the changed racial climate of the 1960s that the Racial Integrity Act was overturned in the SUPREME COURT case *Loving v. Virginia* in 1967.

### radical and labor press

At the turn of the century, strong socialist and labor organizations supported a broad range of newspapers and journals across the United States. With membership in trade unions numbering in the millions after 1900 and socialist parties garnering hundreds of thousands of votes every year, journalists who explored radical causes found an audience for their own publications. The radical press ranged from the socialist *An Appeal to Reason* and *Solidarity*, published by the INDUSTRIAL WORKERS OF THE WORLD (IWW), to the *Woman Rebel*, edited by feminist birth control advocate MARGARET SANGER. Radical publishing houses such as Haldeman-Julius and Charles H. Kerr supplemented newspapers and journals with books and pamphlets on social and political issues.

At a time when major newspapers dominated the urban markets and printing costs escalated, radical newspapers continued to thrive in rural areas, where they appealed to farmers as well as workers, as did the socialist *Appeal*. Inspired by SOCIALISM, and taking seriously the need for alliances across class and region, radical editors sought ways to influence public opinion far beyond the formal membership of socialist and labor organizations. Their investigative

reporting on urban poverty and hazardous working conditions inspired the work of the MUCKRAKERS, reform journalists who directed their critical gaze at political corruption, business monopolies, and employer abuses.

By the turn of the 20th century, there were literally thousands of union newspapers published by city labor federations and national trade unions. They had a readership that numbered in the hundreds of thousands. Labor journals of the time ranged from the relatively conservative *American Federationist*, the journal of the AMERICAN FEDERATION OF LABOR, and *Labor*, published by the railroad unions, to other more militant labor publications. The *American Federationist* had been established to communicate Federation policy and record its organizational progress. For the most part, it served chiefly as an organ for union members and labor organizers. Assistant editor of the *Federationist* between 1901 and 1909, EVA McDONALD VALESH, had a long career in mainstream and labor journalism. During her tenure on the *Federationist*, she reshaped the journal to better educate public opinion and provide publicity; and she gave it a more professional look. It remained, however, the creature of its national leadership. In contrast, the IWW's *Solidarity* served as a forum not just for its editor's agenda. A radical labor newspaper, it served as a forum for rank-and-file writings, songs, poems, and editorial comments. *Solidarity* was blessed with pungent humor and writing with a wide range of perspectives from the lyrics to Joe Hill's labor anthems to the cartoon satire of Mr. Block.

The image of labor in the period embraced a broad masculine labor, but its prose also revealed stories and viewpoints sympathetic to women workers. In the pages of both the *Federationist* and *Solidarity* could be found articles on women's labor organization as well as fiction and advice columns for women. Coverage of women's local labor campaigns and new tactics in organizing women workers, however, were extremely limited; and there was no national network to share information. Women's labor advocates who organized the NATIONAL WOMEN'S TRADE UNION LEAGUE published *Life and Labor* to answer this need. Edited by Australian feminists Alice Henry and Stella Franklin, the journal incorporated some of the best labor reporting with editorial matter on citizenship, education, and politics for women.

Shifts in radicalism brought forth a new generation of radical newspapers and journals. By 1910, broadly defined radical publications such as *The Masses*, edited by Max Eastman and featuring the prose of writers such as JOHN REED and MARY HEATON VORSE, and anarchist EMMA GOLDMAN's *Mother Earth* touted birth control, sexual emancipation, and Freudian psychoanalysis in addition to traditional working-class and populist issues. Experimental arts journals provided a new forum for modern poetry and criticism, with such publications as *Seven Arts* and *Little*

*Review* (edited by Margaret Anderson) leading the way. Edited by Harriet Monroe, *Poetry*, the premier journal for modern poetry, published its first issue in 1911.

By 1910, there were more than 300 socialist newspapers and journals alone. Every major city had labor-oriented socialist newspapers as well, including the *Milwaukee Leader*, the *New York Call*, and the *National Rip Saw* (St. Louis), as well as ethnic journals such as the *Arbeiter Zeitung* (New York). Under the editorship of writer Abraham Cahan, the *Jewish Daily Forward*, published in New York, became a national Yiddish newspaper with a circulation of more than 200,000. Anarchist journals, from Alexander Berkman's short-lived the *Blast* to the *Freie Arbeiter Shtimme* drew audiences far beyond the small number of committed anarchists.

WORLD WAR I changed the political environment in which radical journals had thrived. Prior to the war, government censorship had focused largely on questions of sexual morality and language under the Comstock Laws (see Volume 6). Comstockery, as it was lampooned, had harassed editors and presses about the publication of works such as Theodore Dreiser's *The Genius* and James Joyce's *Ulysses*, which had been serialized in the *Little Review*. While publishers became more willing to take on the censors for the cause of free speech, government censorship had a dampening effect on publishing.

With the entry of the United States into the world conflict, the federal government turned against radical newspapers during the war to suppress discussion of and opposition to military conscription and the war effort. Under the TRADING WITH THE ENEMY ACT, Congress assigned the U.S. Postal Service the responsibility to censor private mail and deny mailing privileges to newspapers and journals critical of the war. It also required all foreign-language publications to submit translations before printing, a time-consuming and expensive requirement that forced many publications simply to close their doors. Under Postmaster General Albert S. Burleson, this broad-based authority was used to exclude publications not only for their opposition to the war but for any content he construed as anti-American. During the war, *The Masses*, *International Socialist Review*, *Appeal to Reason*, and the *Milwaukee Leader*, among others, were denied mailing privileges and hence lost subscribers and revenue. Some were forced to stop publication.

After the war, the antiradicalism of the RED SCARE shut down many radical and labor newspapers. While directed at immigrant RADICALISM and militant trade unionism with its wave of deportations and criminal syndicalism cases, the effort to suppress radical organizations also ensnared mainstream labor unions and labor newspapers. The decline of the labor movement in the face of organized opposition had led to a similar decline in the

information available about labor and working class organization throughout the world. The Federated Press, a labor news service established at the 1919 nominating convention of the FARMER-LABOR PARTY, set out to address that need. Under the editorship of Robert M. Buck, the Press had a subscription list of 32 labor and farmer-labor newspapers, a small base that almost immediately undermined the service. It nearly collapsed financially in 1921–22, but under the new editor, former war resister Carl Haessler, the Federated Press survived and sometimes even thrived until 1956. At times, the Press's subscription list numbered more than 100 newspapers and journals. With the aim of rebuilding the devastated labor movement, the Federated Press had as its primary objective changing the pro-business and antilabor political environment. To do so, it had to take on the news media monopoly and create a national—and even international—network of labor and working-class reporters who shared information from all corners of the country and even the world.

During the 1920s, the Federated Press ran its own national *Labor Letter* and also sent out wire service stories on strikes and organizing campaigns, periodic updates on the campaign to free SACCO AND VANZETTI, and reports from the road on workers' lives and struggles, as in the reporting of Art Shields and Esther Lowell. Writer Mary Heaton Vorse sent in her reports from the GASTONIA STRIKE and other labor protests. Harvey and Jessie O'Connor worked for the Federated Press in a similar capacity, with Harvey sometimes taking on editorial duties. Anna Louise Strong reported from Russia in the Federated Press's early years. Lawrence Todd sent reports from Washington, D.C., on Congress and federal policy; Louis Lochner reported on the political upheavals in Weimar Germany. While the Federated Press sometimes appeared a largely voluntary effort, as its reporters were often paid poorly, if at all, it managed to report on all the major issues of the 1920s and establish a firm basis for the revival of the labor press in the 1930s.

At the same time, the RUSSIAN REVOLUTION changed the nature of radicalism in the United States. Newly formed communist parties, sympathetic to the Soviet Union, seceded from older, more conservative socialist organizations. Labor unions divided along similar political lines, which rendered them ineffective in responding to the new conservatism. Antiunion activity both during and after World War I brought about the decline in union membership. All of these forces led to the closing of many small labor and radical publications. At the same time, a new generation of radical newspapers and journals, stimulated by new communist parties and the fomenting of revolution abroad, emerged on the scene.

In the 1920s, *Masses* editor Max Eastman joined with Floyd Dell to edit a new journal, the *Liberator*. V. F. Cal-

verton, an intellectual affiliated with the Greenwich Village group, began his new journal, *Modern Quarterly*, which kept radical theory and avant-garde literature before the public. The Communist Party launched its *Daily Worker* and radical labor groups began to publish infrequent numbers of newsletters and journals. City central labor unions, faced with steep declines in membership, still managed to keep their newspapers afloat. With the woman suffrage movement victorious, the old suffrage journals closed their doors, to be replaced with the *Woman Voter* (League of Women Voters) and *Equal Rights* (National Woman's Party). Neither attained the same loyal following as their suffrage predecessors. Only with the revival of radical fortunes in the wake of the GREAT DEPRESSION did the alternative press again thrive.

## radicalism

American radicalism played an important role in shaping the nation's political development between 1900 and 1930. Radicalism can be defined as opposition to the dominant economic, political, and social structures of the country. At the turn of the century, this meant opposition to the poverty and social inequality created by MASS PRODUCTION industry, free-market capitalism, and emerging consumerism. Radicalism in the United States had several different strains, including anarchism, socialism, labor militancy, feminism, and cultural radicalism. The upsurge in radicalism between 1900 and 1920 did not, however, result in an attempt to overthrow the government or the formation of a permanent third political party. Radicals tended to support gradual reform, rather than violent revolution. The RED SCARE and political repression in the 1920s kept radicals divided throughout the decade.

The radicalism of the early 20th century drew on the concerns and tactics of its predecessors. The emergence of the industrial revolution, urbanization, and the demise of small, independent farming resulted in social and political unrest in the 1880s and 1890s. Several political movements attempted to address the concerns of workers, farmers, and immigrants. In the 1880s, the Knights Of Labor attempted to organize the new industrial workers, southern African-

American sharecroppers, and farmers struggling to maintain their independence. In the 1890s, the populists also attempted to address the plight of farmers by attacking the power of the railroads and the banks. Both the Knights and the populists advocated that the federal government play a larger role in ensuring social harmony by redistributing wealth and property more equally, but they refrained from calling for the abolition of private property or from seeking violent means for social change. In the same period of time, women continued to organize for WOMAN SUFFRAGE and PROHIBITION, among other reforms.

A more class-based form of radicalism emerged at the dawn of the 20th century. Support for SOCIALISM grew rapidly among new immigrants, intellectuals, agrarian activists, and industrial workers. This new socialism was by no means confined to the working class, but it did highlight workers' concerns. Between 1890 and 1910, business and industry actively worked to suppress unionism by employing company spies to infiltrate unions, blacklisting suspected radicals and union supporters, forcing workers to sign anti-union contracts, and using labor injunctions to break strikes. Added to this were changes in the pace of work and how work was organized. As workers began to resist these changes, some found the efforts of the conservative AMERICAN FEDERATION OF LABOR (AFL) to be insufficient. Socialists, both in the labor movement and outside the labor movement, argued that industry and wealth should benefit all of society, not just a wealthy elite. In 1901, the Socialist Labor Party, led by Morris Hillquit and Daniel De Leon, merged with the Social Democratic Party, led by EUGENE V. DEBS, to form the Socialist Party of America (SPA). The SPA grew steadily between 1900 and 1912. Its goals were diffuse, from supporting political reform and labor legislation to municipal ownership of utilities and urban transportation.

Syndicalism, or revolutionary industrial unionism, was another form of socialism that gained support among workers. Its ultimate goal was to organize society and government on an industrial basis. The INDUSTRIAL WORKERS OF THE WORLD (IWW), the leading voice of syndicalism in the United States, emerged in 1905 and quickly challenged the dominance of the AFL. In its most radical form, the IWW supported the general strike, producer cooperatives, workers' control of production, and the abolition of capitalism. More typically, the IWW directed its energies toward forms of direct action, including massive strikes at McKees Rocks in 1909 and the LAWRENCE STRIKE in 1912. Its membership grew steadily until WORLD WAR I, when it declined in the face of government repression under the ESPIONAGE ACT and SEDITION ACT and state criminal syndicalism laws, but it never seriously threatened the dominance of the AFL.

Anarchism, another form of radicalism, advocated extreme means of opposing capitalism and the status quo.

Some individualist anarchists feared that the rise of modern, urban, and industrial society threatened to undermine individual rights. The majority of American anarchists were followers of Peter Kropotkin, a Russian communitarian anarchist. In general, they opposed centralized government, because it inevitably led to economic exploitation, militarism, and war.

Finally, some socialists, anarchists, and syndicalists gravitated toward communism, particularly after the RUSSIAN REVOLUTION of 1917. In 1919, two competing factions—the COMMUNIST PARTY and the Communist Labor Party—split from the Socialist Party and its international sections. Each claimed to be the legitimate representative of the worldwide communist revolution. The two factions merged in 1924. By 1929 the party was known as the Communist Party of the United States of America (CPUSA). Between 1919 and 1930, American communists focused their efforts on recruiting industrial workers in core industries such as steel, coal, and automobiles, and—to a lesser extent—organized among African-American sharecroppers. Prior to 1930, support for communism among union members remained very small.

Several key factors ensured that American radicalism failed to have the impact radicalism had in Europe. Judged by the absence of an independent working-class or labor politics, American radicalism failed. There were reasons for this failure. The national economy, despite cyclical depressions, grew at a faster rate than did the economies of Europe. Though workers and poorer Americans did not share equally in the nation's economic growth, many workers and recently arrived immigrants saw improvements in their standard of living. The result was that many ordinary men and women were reluctant to support efforts for greater state intervention in the economy, and indeed, there was a commonly held distrust of government among both working-class and middle-class Americans. Few advocated the abolition of private property. Socialists and Social Democrats, who generally advocated more moderate reforms, were able to generate much more widespread support. Even the million votes for Eugene Debs in 1912 could not compare in political dominance with the two mainstream political parties.

Possibly the most significant reason why radicalism failed to have a greater impact in the United States was that radicals encountered a coordinated resistance from the government, the courts, and employers. Employers fired and blacklisted suspected radicals. When violence did occur, judges sought to ensure that radical leaders were convicted and either deported or sentenced to long prison terms. Both federal troops and state militias as well as private corporate arming were used to violently repress strikes. Finally, at the outbreak of World War I, federal legislation made it illegal to criticize the government or to oppose American

involvement in the war. Socialist Eugene Debs and anarchist EMMA GOLDMAN both were arrested and convicted of violating these laws. Attacks against radicals and radicalism continued after the end of the war in 1918.

The fear that radicals were behind the massive post-war strikes fueled the Red Scare of 1919–20. Led by Attorney General A. MITCHELL PALMER, the government launched a series of raids against radicals, which specifically targeted the offices of the IWW and the Communist Party. The largest raid took place on January 2, 1920, when approximately 10,000 suspected communists and communist sympathizers were arrested and held without bail. Many of those arrested, particularly those who were recent immigrants, were deported from the country. Afterward the labor movement and other radical political organizations were in a shambles; longtime SPA leader Eugene Debs was serving a prison sentence for treason, and fear of deportation and blacklisting silenced many immigrants and workers.

At the same time, radical ideas did change the way that government and society functioned in the United States. Socialist thought influenced the reform movement of PROGRESSIVISM and helped to shape legislation to regulate business and protect women and child wage earners. Reformers such as the National Consumer League's FLORENCE KELLEY and Social Gospel minister WALTER RAUSCHENBUSCH read socialist texts and moved to incorporate the more humanitarian strains of radical thinking. Feminist thinkers like CHARLOTTE PERKINS GILMAN and civil rights advocate W. E. B. DUBOIS contributed to both mainstream and radical social thought. Sexual mores, gender norms, and racial etiquette were altered by the radical culture of the early 20th century. When the Republican administrations of WILLIAM HOWARD TAFT and CALVIN COOLIDGE argued that it was time to return the country to normalcy and economic prosperity, they spoke of retaking the government. But as the radical revival during the Great Depression would show, radicalism did not die in the 1920s; it just shifted ground.

## radio

The period from 1899 to 1930 was marked by two significant developments in the history of radio in the United States. In

1899, Guglielmo Marconi, the first inventor to successfully transmit and receive radio signals, demonstrated his invention for the first time to an American audience. By 1930, the *Amos 'n' Andy* radio program had set the standard by which all radio broadcasting would be developed. Between these two events, developments within the radio industry created the modern system of broadcasting in which stations are corporately owned, connected in a network, and made profitable by advertising.

During the first decade of the 20th century, the inventors and corporations involved in the development of radio technology hoped to develop an alternative to the use of wires in telegraph and telephone communications. Their goals were evident in the term used for the new technologies: radio telegraphy. Marconi's own company, which became Radio Corporation of America (RCA) in 1919, focused on developing applications such as ship-to-ship or ship-to-shore communications. The telephone company, AT&T, became involved in radio in the hope of discovering ways to better their phone service through wireless technology. The Westinghouse and General Electric companies also pursued radio technology in the hope that it would lead to large profits from the manufacture and sale of radio equipment. They assumed that once perfected, radio telegraphy would become essential for shipping companies, telegraph and telephone companies, and the U.S. government.

It was not until WORLD WAR I that any of these corporations saw the economic possibilities in transmitting voice signals over the air. Many other Americans had embraced voice transmission, or as it was known at the time, radio telephony. The first radio voice broadcast occurred in 1906. Radio telephony over the next decade was characterized by its amateur status. Thousands of radio enthusiasts throughout the country built their own transmitters and receivers and began to send signals. Some of them transmitted music, speeches, dramatic plays, and news. None of this was done for profit. The signals were weak and often interrupted by static.

When inventors improved the technology to send long distance signals that could be heard more clearly, the larger communication companies began to embrace radio telephony. In 1915, AT&T sent the first transatlantic voice transmission. This transmission attracted the U.S. Navy's attention, and it began to outfit its ships with radio stations capable of sending voice transmissions. United States involvement in World War I led the navy to seize control of the radio industry in the interests of national defense. Its demands for high-quality radio equipment favored the large companies. With the navy's help, the largest companies in radio joined in an organization known as the Radio Group for the purpose of sharing patent information. This combination of the companies helped speed the development

of better radio equipment, but it had unintended consequences. Four companies—RCA, Westinghouse, General Electric, and AT&T—came to dominate the production of radio equipment and the operation of stations.

At the end of the war, the companies that dominated radio still did not see the future of radio broadcasting. They believed that radio telephony was best suited for point-to-point communication; but this began to change in the 1920s. The turn to radio broadcasting emerged out of the wartime agreement between the large radio companies that the U.S. government had brokered. As part of the agreement, the Westinghouse Corporation had given up its rights to operate voice transmission stations in return for the right to share the manufacturing market with General Electric. Having lost out on the lucrative market of voice communications, Westinghouse began to look for other ways to profit from its radio manufacturing business.

In 1920 Westinghouse came up with an idea that changed the nature of radio and its role in American soci-

ety. Amateur radio broadcasts were becoming more sophisticated as equipment improved. More people were using their radio transmitters to send music and other programming over the airwaves. The number of radio sets also was increasing because there was more on the airwaves. In 1920, a Westinghouse official noticed that a Pittsburgh department store's newspaper advertisement for radio sets mentioned a specific radio program. Westinghouse decided that if an amateur program could sell radio sets, then professional radio broadcasts could help them sell their radio equipment. The desire to sell more radio equipment led to the first regular broadcast station in the United States.

On November 2, 1920, station KDKA, broadcasting from the Westinghouse factory in Pittsburgh, became the first radio station to institute regular broadcasting when it covered the Harding-Cox presidential election. After this first broadcast, KDKA broadcast a regular program every night. Originally only one hour in length, the program was a watershed in radio, because it was the first to be broadcast on a regular schedule.

Operators copying messages transmitted from ships at sea at the Marconi wireless school, New York, ca. 1912 (*Library of Congress*)

Once Americans realized the power of radio broadcasting, the number of stations expanded dramatically. The stations were owned by a variety of businesses and organizations. Radio stores and equipment dealers started local stations in order to increase demand for their products. Local department stores used radio stations to advertise their products and increase demand for the radios they sold. Newspapers established stations in an effort to join the new media that might threaten their control over the news. Colleges and universities used stations as learning tools for their students. Westinghouse's success in radio broadcasting led the other giants in the radio industry to establish their own stations.

The explosion of radio broadcasting led to questions about how radio was to survive financially. Some people advocated government control of radio broadcasting supported by a tax, but the ultimate solution embraced a free market approach. By 1923, the AT&T-owned station WEAJ in New York was broadcasting programs sponsored by commercial companies. WEAJ used the revenue from these programs to improve its equipment, which made it possible to reach more radio listeners. In turn, the growing audience made the station more attractive to sponsors. WEAJ's success led other stations to turn to sponsors for financing their programs, and the age of radio advertising was born. It was not until the end of the 1920s, however, that the true commercial possibilities of radio were recognized.

Programming in these early days was sporadic. Even the larger stations broadcast for only part of the day. Local stations often scrambled to find programming. Initially, broadcasters were able to attract musicians and other performers for free in return for the publicity. They also played phonograph records and read the news. In an effort to fill out programming, radio entrepreneurs established the network system. The network system was built around a single, high-powered station that provided high-quality programming (by recordings, when stations were beyond the reach of the network leader's transmitters) to its affiliates throughout the country. RCA and AT&T established the first networks in 1925. They did not, however, provide extensive broadcasting, but rather individual programs and special events. In 1926, in an effort to forestall competition that both companies saw as harmful, RCA and AT&T entered into an agreement in which AT&T sold its flagship station, New York's WEAJ, to RCA, which gave RCA control of both radio networks. RCA created a new corporation to run its broadcasting system, and in January 1927, the National Broadcasting Company (NBC) began regular programming.

As the network system increased the quality and quantity of programs available, radio's popularity boomed. Between 1922 and 1928, the number of radio sets increased from 60,000 to 7,500,000. With approximately one-third

of the U.S. population listening, radio became a powerful force in American society. The programs helped shape American tastes for music, for example. In the 1920s, music made up the bulk of radio programming; and most of it was classical music. As radio's popularity increased so did the popularity of classical music. The number of orchestras in the United States increased dramatically, along with the sale of musical instruments. Schools began to teach music as part of their regular curriculum. Some stations helped popularize other kinds of music. Radio stations that played jazz and hillbilly music helped spread these to northern cities. Radio stations also introduced the first variety acts during the 1920s.

Even with the success of their programming, radio stations and networks had difficulty convincing businesses that sponsoring radio programs was worthwhile. One radio program changed all that. In 1928, the *Amos 'n' Andy* program went on the air and changed radio forever. Created by two veteran radio performers, Freeman Gosden and Charles Correll, the program was based on the lives of two naive African Americans living in Chicago. The comedy revolved around the African-American dialect and their continuous mishaps and misunderstandings, which stemmed from an inability to understand the complex world in which they lived. The 15-minute program was the first successful radio comedy with a continuous story line from show to show. The radio public eagerly anticipated each week's show to find out what happened to the two main characters. By the end of the 1920s, 40 million listeners—one-third of the U.S. population—tuned into *Amos 'n' Andy* each week.

The program's significance spread beyond its mere popularity. It made the commercial possibility of radio clear. Colgate Company, the program's sponsor, enjoyed a marked increase in sales of its toothpaste. With prospective audiences of 40 million, companies began to line up to sponsor programs. As network advertising revenue grew, they could broadcast more programs and increase their role in American radio broadcasting, leading to the system of media broadcasting that still exists today in television.

## Railroad Administration

In the winter of 1917–18, President WOODROW WILSON took over the railroads in the United States and created the Railroad Administration. In seeking to forge a war economy, Wilson most often preferred voluntary means.

However, when the 2,905 companies that owned 397,014 miles of track refused to cooperate with each other and caused a standstill on the rails, the government acted swiftly. The railroads were just one part of the mobilization challenges facing the Wilson administration during WORLD WAR I. Because the United States was not prepared for its entry into global war, despite many warnings, its victory in the war could not be assured. Wilson, who had hoped for peace, had only belatedly joined in preparedness measures such as those in 1915 when he created the civilian Council on National Defense, which studied problems of economic mobilization.

Prior to the war, the railroads had functioned profitably. They had paid their workers low wages and had invested little in their operation costs. During wartime they had little interest in improving the system to upgrade service, even though they needed approximately 115,000 new railroad cars. The hard-won ADAMSON ACT ensured for railway workers an eight-hour day for all employees on trains in interstate commerce, with extra pay for overtime, but most workers were still unhappy with their lot. Other wartime industry jobs were more attractive and with better pay, leaving a critical shortage of railway workers.

Wilson strove to inspire all labor in the United States to put forth their best effort for the country with slogans like "Labor Will Win the War." Women picked up the slack by entering into industry and agriculture. The AMERICAN FEDERATION OF LABOR gave loyal support to the war effort. Most mobilization for the war effort was voluntary.

Railroad companies, however, refused to coordinate their efforts to ensure the transport of war materials, and acute shortages on the war front endangered American efforts. In the winter of 1917–18, 180,000 railroad cars sat idle. The Military Affairs Committee under Senator George Earle Chamberlain (R–Oregon) called for an inquiry. The railroads' lack of preparedness was apparent to committee members. Two weeks after the hearing, the railroads were taken over by presidential decree. Secretary of the Treasury William McAdoo became "tsar of the rails." He faced challenging weather conditions immediately as winter storms raged in the Northeast. By summer, however, the railroads were operating effectively.

Passed in May 1918, the Overton Act gave the president powers for the duration of the war and six months after. It allowed him to consolidate the six war agencies (fuel, food, shipping, railroads, war trade, and war industries) into a war cabinet. It also gave him power to disband, add, or reorganize any executive or administrative agency without the approval of Congress. Thus, by 1918, the United States had changed within one year from being a "free economy" to a managed one. Railroads became a major beneficiary of government support and regulation, due to their vital role in defense.

### Railroad Shopmen's Strike (1922)

One of the most important labor conflicts in the 20th century, the Railroad Shopmen's Strike mobilized more than 400,000 railroad workers nationwide in 1922. The strike lasted into the following year and did not come to an official end until 1928. The shop craft workers struck in response to the decision of the Railroad Labor Board to institute a wage cut in July of 1922, the second in a series of wage cuts, and in opposition to work rule changes on the railroads. The striking workers sought better pay, the reinstatement of overtime pay, and an end to contracting out shop work, a business practice that undercut union labor.

As *Minnesota Union Advocate* editor William Mahoney wrote, "the greatest industrial struggle that ever occurred in America" began in countless towns and cities across the United States, wherever railroad labor had a presence, in the summer of 1922. While the railroad operators unions, such as the Brotherhood of Railway Engineers and Firemen, did not join the strike, the shop craft workers, who constituted about 20 percent of the railway labor force nationwide, walked off the job. Railroad shop men were those workers who maintained the rolling stock, the rails and rail beds, including machinists, boilermakers, sheet metal workers, and electrical workers. Their labor, while vital to the long-term condition of railroads, did not stop the trains from running immediately. This fact alone undermined the shop men's ability to negotiate with management. Further, the economic downturn that followed the war provided the rationale for reducing the wages of railroad workers from their wartime levels. With high unemployment and a surplus of available labor, the railroad companies were able to hire replacement workers to fill nearly three-quarters of the strikers' jobs.

The federal government played a major role in suppressing the strike. Because the aggressive response of the company and the militancy of the railroad shop unions led to confrontations in many towns and cities across the nation, the opponents of organized labor were able to call on the federal government for aid. Attorney General Harry M. Daugherty persuaded President WARREN G. HARDING that unions and workers were resorting to violent means to win the strike. Other members of Harding's cabinet, including Secretary of Labor James J. Davis and Secretary of Commerce Herbert Hoover, argued that the workers had some real grievances. With information on unions from the Bureau of Investigation and Harding's approval, however, Daugherty sought a federal injunction against

the strike, which federal judge James Wilkerson granted. The “Daugherty Injunction” enjoined any form of strike activity, including picketing and even assembling near rail lines. The federal government hired 2,200 new U.S. marshals to enforce the injunction and sent federal troops into centers of strike activity to control crowds and protect strikebreakers.

Federal intervention undermined the ability of the railroad shop craft unions to maintain the strike. Settlement with the unions required that worker seniority be respected; but many railroad shop men found themselves unemployed and unemployable, at least in railroad work. Only about a third of all strikers went back to their railroad jobs. Railroad superintendents such as Northern Pacific’s H. M. Curry used the strike as an opportunity to “rid the service of chronic agitators, fault finders, time servers, etc.” Rail companies targeted such “undesirables.”

The 1922 Railroad Shopmen’s Strike ended in a decisive defeat of the union, which had a chilling effect on labor relations nationwide. More than the STEEL STRIKE OF 1919, which occurred on a similar scale in a strategic industry, the defeat of the rail strike signaled the beginning of organized labor’s retreat from workplace militancy and its turn toward accommodation during the 1920s. At the same time, because the national rail lines wished to avoid another massive confrontation, the 1922 strike paved the way for the Railway Labor Act of 1926, on which labor relations in the national railroad industry would be based for decades.

**Rankin, Jeannette** (1880–1973) *suffragist, pacifist, U.S. representative*

Born in 1880 in Montana, Jeannette Rankin was the oldest of 11 children born to John Rankin and Olive Pickering. Her father was a rancher, and her mother had worked as a teacher. Attending college at Montana State University, Jeannette earned a degree in biology in 1902. That same year, her father died, leaving Jeannette with an inheritance. After college, Rankin experimented with several vocations including teaching and social work. Her employment experiences eventually directed her into the WOMAN SUFFRAGE movement, as she believed that women needed to be part of the electorate in order to pursue social reform.

Rankin’s background in social work in Washington State convinced her to participate in that state’s 1910 wom-

en’s suffrage campaign. Three years later, she was hired by the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION to campaign for the passage of state suffrage laws. In her home state of Montana, Rankin’s grassroots experience and eloquence helped women’s suffrage to pass in 1914. Two years later, she ran for a seat in the House of Representatives as a Republican and won, making her the first woman elected to Congress. Her victory was partially the result of women’s new enfranchisement. Rankin’s pacifism, moreover, likely attracted votes from citizens who worried about the war in Europe.

Rankin’s historical fame would come as a result of her time in Congress. In 1917, she voted against Woodrow Wilson’s request for a declaration of war. Although this vote gained her the most attention, Rankin also worked on labor law reform, civil liberties, and a federal women’s suffrage amendment; the latter passed the House in 1917 and the Senate in 1918. Her first term in Congress, however, was overshadowed by her antiwar vote. After redistricting cost Rankin her seat, she ran for the Senate and eventually lost.

Her interwar activism was dedicated to peace through the WOMEN’S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM and to CIVIL LIBERTIES through the AMERICAN CIVIL LIBERTIES UNION. She continued to travel the country giving antiwar speeches. On the eve of World War II, she decided to run for Congress on a neutrality plank. She won. After the 1941 Japanese attack on Pearl Harbor, Rankin again voted against an American declaration of war. She was widely condemned but, as a pacifist, voted her conscience.

After Rankin left Congress, she traveled, cared for family members, and then became an antiwar activist once again. As social protest developed in the late 1950s and early 1960s around a variety of issues including racial discrimination, the nuclear arms race, and student rights, Jeannette Rankin was rediscovered. Rankin’s blending of feminism and pacifism inspired a new generation of women’s rights advocates and antiwar activists. In 1968, at the age of 87, Rankin led the Jeannette Rankin Brigade of 5,000 women in a dramatic protest against the war in Vietnam.

**Rauschenbusch, Walter** (1861–1918) *Baptist theologian, educator, social reformer*

Baptist minister and social reformer Walter Rauschenbusch was born in 1861. His father was a German immigrant

clergyman in Rochester, New York, and Walter graduated from Rochester Theological Seminary in 1887. He went on to study economics, theology, and industrial relations in Germany and Britain in the 1890s. Named pastor of the Second German Baptist Church in New York City's "Hell's Kitchen," he witnessed the struggles of the urban immigrants firsthand. Rauschenbusch believed that industrialization eroded workers' religious commitment.

As a prominent figure in the Social Gospel movement of the Progressive Era, Rauschenbusch sought to apply the principles of Christianity to urban reform. Influenced by the Christian Socialism he saw in Germany and Britain, he critiqued the economic and social conditions that dehumanized urban immigrants and isolated them from religion. Broadening the context of sin, he saw social ills as a form of evil. Purifying democracy required Christians to infuse the spirit of Christ into the secular world. Like many other Social Gospel advocates, Rauschenbusch believed that the state should play a role in rectifying injustice. He also argued that Protestantism needed to become more socially relevant by addressing the problems of the urban poor. Salvation for the human race came through civic activism and social service.

Rauschenbusch was one of the first to undermine the social and intellectual assumptions of his time by arguing that Social Darwinism need not be a fierce competition among humans. Rather, evolution required the religious and social awakening of humanitarianism. In such works as *Christianity and the Social Crisis* (1907) and *A Theology for the Social Gospel* (1917), Rauschenbusch rendered religious social reform a mainstream movement in the United States. In his 1910 prayer book, *For God and the People* (1910), he declared the Lord's Prayer the great prayer of social Christianity. His works had a wide readership.

In 1897, Rauschenbusch left parish work to become a professor of church history at Rochester Theological Seminary and devoted himself to a career of writing, public speaking, and active social reform. It was only when WORLD WAR I stirred anti-German sentiment that he withdrew from public life. He died in 1918.

## recreation

Recreation, defined as leisure-time activities pursued for pleasure, underwent significant change during the early 20th century. At the turn of the century, class largely determined recreational opportunities. Upper-class Americans who were not tied down by work schedules and were

wealthy enough, enjoyed a variety of recreational activities ranging from bicycling to summer vacations. The growing middle class was beginning to engage in many of the same recreational opportunities, albeit on a less grand scale, by the turn of the century. Wageworkers, on the other hand, did not have the time or money to participate in recreational activities beyond trips to the saloon for men, informal interactions among neighbors, and church activities.

This pattern changed during the first three decades of the 20th century as recreation became democratized. Early 20th-century changes in the workplace led to decreased hours for wage laborers at a time when real income was rising. Although wage laborers were never able to afford the grand vacations undertaken by wealthier Americans, they enjoyed increased access to recreational activities. This in turn led to a tremendous increase in the number of available recreational activities as entrepreneurs jumped in to take advantage of the new demand and reformers attempted to use recreation as a means to reform society.

Americans participated in a tremendous variety of different activities. Some involved an afternoon while others occupied an entire week or longer. While many spent their leisure time in their homes and neighborhoods, the 20th century brought a blossoming of recreational activities in places designed specifically for recreation. It was during this period that amusement parks first emerged, BASEBALL became a national phenomenon both as a spectator sport and as a game to be played, and cities throughout America created public playgrounds and parks, to name just a few of the new recreational activities. Some forms of recreation brought people of various backgrounds together to share a common commercial culture, and many public amusements became places where social differences lessened. Other activities maintained social distinctions. The one common characteristic shared by all Americans was an increase in time spent taking part in recreational activities, despite industries' increasing reliance on the time clock and systemization. Some activities helped workers escape for a brief time while others provided longer respites.

One of the most popular recreational activities was a trip to public amusement parks. These parks symbolized the cultural changes taking place. They helped challenge Victorian codes of behavior but did so in a safe, controlled environment. Modeling themselves on the 1893 Columbian Exhibition in Chicago and the 1901 Pan American Exposition in Buffalo, amusement parks opened in or near every major city in the first years of the 20th century. The first and best known parks—Steeplechase, Luna, and Dreamland—opened on Coney Island, New York, and set the standard for parks nationwide. Developers of these parks created fantasylands where city residents could escape for a day to experience thrills. The key to their popularity was the parks' easy access by rail from neighboring cities and their appeal

Thousands of Americans flocked to the seashore, as seen here on the New Jersey shore. (*Library of Congress*)

to visitors of all classes, which they accomplished by offering a variety of attractions. The parks offered roller coasters and other thrill rides, theatrical performances, dance halls, animal shows and rides, sideshow performances, ostensibly educational performances, and disaster exhibitions demonstrating, for example, the floods that devastated Johnstown, Pennsylvania, and Galveston, Texas.

The amusements offered at the parks often challenged accepted modes of behavior by offering ribald attractions disguised as wholesome or educational entertainment. One park, for example, offered an exhibit of "The Streets of Cairo and Mysterious Asia," which included female dancers in states of dress that no proper audience would accept in other contexts. The parks also appealed to young men and women who were beginning to strain against Victorian codes of morality that prescribed a strict distance between the sexes. At the parks, men and women could interact socially with members of the opposite sex outside the supervision of their families. The rides were popular with youths, because the action of the rides often threw men and women together or forced them to hang on to one

another for balance, thus allowing physical contact frowned upon in other settings.

New forms of recreation did not have to involve day-long excursions to amusement parks. Many young working-class and middle-class men and women attended dance halls at night, an urban phenomenon made possible by the tremendous increase in young single women drawn to the cities by available work. Men and women went to the dance halls for the chance to mingle with members of the opposite sex outside of parental supervision. Other men and women attended dances and concerts sponsored by such organizations as the YOUNG MEN'S CHRISTIAN ASSOCIATION AND YOUNG WOMEN'S CHRISTIAN ASSOCIATION.

Many types of recreation emerged during these years. The most significant was the motion picture. First made available by one-person nickelodeons in which customers could watch a brief film clip by dropping a nickel into the slot and peering through a small viewer, motion pictures enjoyed great popularity even before they could be projected onto a screen. Once the technology improved to where films could be shown on a screen, films quickly

became the most popular form of recreation. One reason for motion pictures' popularity is that they appealed to a wide audience. Ticket prices were low enough that practically anyone could attend as long as they followed the rules of behavior set forth by theater owners. Even when theater owners began to build ornate houses in central business districts in an effort to attract a wealthier clientele, working-class film lovers could still attend neighborhood theaters.

Americans of all classes also enjoyed SPORTS, both as participants and spectators. It was during the period from 1900 to 1930 that athletic contests witnessed by large crowds emerged. While the audiences were restricted by ticket prices and the fact that few games were played on Sunday, the workers' only day off, attendance at sporting events skyrocketed. Between 1903 and 1908, for example, attendance at major league baseball games doubled. In response, several professional teams built new stadiums. College football also enjoyed tremendous popularity, and universities built football stadiums with capacities up to 80,000. In the early years of the century, critics had tried to outlaw boxing because of the brutality of some fights, but by 1927 it had rebounded to a point where 145,000 fans witnessed a title bout between Gene Tunney and JACK DEMPSEY at Chicago's Soldier Field.

People were doing more than just watching sports; they spent a great deal of time participating in them. Baseball's popularity extended to a myriad of amateur teams and leagues. Towns throughout America had amateur or semipro teams for both men and women, factories formed leagues, and baseball gear became standard issue for U.S. military units. Golf, tennis, and skiing also exploded in popularity among those Americans able to afford them. Holiday celebrations, such as union picnics on Labor Day, often included athletic contests in which participants competed for prizes. Cities built parks with playing fields to provide play space for their working-class citizens.

Most cities did not, however, build parks and simply turn them over to the people. Many reformers hoped to use recreation as a way to reform American society. Every large city in America created its own recreation department staffed by a team of experts who oversaw the use of the city's parks and playing fields. Many reformers believed that athletic contests and games had the power to connect participants to their proper place in the social order, but only if played in the proper way. Unfortunately for the reformers, the users of the parks and playgrounds had their own ideas of how to use them, and no amount of coaching or policing could make them follow the guidelines set by recreation departments.

Americans also participated in numerous recreational activities that did not involve athletics. There were crazes, for example, for ping-pong in 1913, mah-jongg in 1923,

crossword puzzles in 1924, contract bridge in the 1920s, and miniature golf in 1930. As soon as they tired of one fad, people turned to new ways to spend their leisure time.

Citizens used their leisure time to make longer escapes from the city as well by going on vacations. In the early years of the 20th century, vacations were still enjoyed predominantly by the middle classes. Before the 1910s, any time off that wageworkers received was unpaid, which for the most part precluded taking any sort of vacation. The vacations taken by middle-class Americans usually involved trips to resorts and hotels at various waterfront locations. Many enjoyed their first vacation experience at camp revival meetings, where they immersed themselves in religious activity. Camping also became very popular, especially when the automobile became widely available. Families could hop in their car and tour the country, stopping to camp along the way. Automobiles provided a form of vacation that was affordable to many middle-class workers.

It was not until after WORLD WAR I that working-class Americans were able to take vacations in significant numbers, a change brought about by a number of developments. In the tightened labor market employers became more concerned with their employees' health and happiness, and studies showed that rest benefited both the workers and the employers. As a result, many more employers began to give paid vacations to wage workers. In addition, the cost of automobiles dropped considerably in the 1910s, putting them within reach of working-class Americans. Workers could, therefore, take their families on trips in their cars. Vacations still had to be cheap by necessity, but car trips to fishing and hunting spots, camping trips, and to visit relatives were within the financial means of many wage-workers. By 1930, the family vacation was well on its way to becoming the mass phenomenon that it is today. Between 1900 and 1930, many novel recreational activities became mainstream. Americans decided that recreation was integral to their happiness and therefore embraced a myriad of recreational possibilities. In doing so, they helped usher in many characteristics of our modern society.

## Red Scare

The Red Scare took place between 1919 and 1920 as a backlash against the recent successes, in Europe and the United States, of radicals and progressive who were calling

for sweeping economic and political reforms. The peak of the Red Scare hysteria took place in January 1920 when Attorney General A. MITCHELL PALMER coordinated raids against numerous labor unions and political groups and arrested hundreds of suspected radicals. The primary impetus behind Palmer's actions was the recent upsurge in labor militancy and fear that the RUSSIAN REVOLUTION of 1917 would inspire similar actions in the United States.

The withdrawal of Russia from WORLD WAR I in 1918 and the Bolshevik call for the worldwide overthrow of capitalism resulted in suspicion of a broad range of labor and political activism in the United States. During the war, President WOODROW WILSON had attempted to keep labor disputes in check by creating an accord between labor and employers in which the federal government arbitrated disputes in exchange for labor's pledge not to strike. Labor unrest mounted as the war reached its conclusion. Workers and union leaders felt they had not received their fair share of wartime profits and that inflation, which reached 69 percent between 1914 and 1918, had largely eroded any gains they had made. When military expenditures and overtime pay came to a halt following the war, labor unrest increased. Frustrated by loss of real wages and wage cuts, and inspired by labor militancy in Russia and western Europe, more than 4 million American workers walked off the job in 1919. Nor was political unrest limited to the workplace, as progressives and socialists gained a significant following among middle-class men and women, the intelligentsia, working-class immigrants, and African Americans. Membership in labor unions and radical political organizations peaked between 1918 and 1920. By 1920, the Socialist Party of America had over 150,000 members, and Socialist Party presidential candidate EUGENE V. DEBS received almost 1 million votes. Membership in the UNITED MINE WORKERS OF AMERICA topped the 500,000 mark, and nearly 5 million workers belonged to labor unions.

Concern about RADICALISM and the growing strength of organized labor escalated following the war as a wave of strikes spread throughout the country, including strikes by miners, textile workers, a police strike in Boston, and the SEATTLE GENERAL STRIKE. The wave of unrest prompted Attorney General Palmer to conclude that a Bolshevik plot had been hatched to overthrow the country. He responded by launching an all-out effort to contain what he thought was a "Red Menace." After a series of bombings at the homes of Palmer and other government officials, he launched a series of raids against resident immigrant radicals, the INDUSTRIAL WORKERS OF THE WORLD (IWW), and factions of the COMMUNIST PARTY. The largest raid took place on January 2, 1920, when approximately 10,000 suspected communists and communist sympathizers were arrested and held without bail. Many of those arrested, particularly those who were recent immigrants, were deported.

The Red Scare also directed attention toward African Americans. Opposition to Jim Crow laws and the lynching of African Americans intensified after World War I as thousands of black soldiers returned home with a renewed determination to bring the fight for democracy back home. Between April and October of 1919, there were 25 race riots and dozens of African Americans were lynched. For the Department of Justice, however, the real threat lay in organized resistance, and government surveillance of African Americans increased during and after the war.

The Red Scare of 1919–20 had a chilling effect on labor unions and progressive politics throughout the 1920s. Union membership, which reached an all-time high of 5 million in 1921, plummeted throughout the rest of the decade. Similarly, support for the IWW and the Socialist Party peaked in 1919–20. Within the course of the next decade, membership in radical organizations plummeted.

**Reed, John** (1887–1920) *journalist, activist, communist organizer*

John Reed was one of the few American journalists in Russia during its 1917 revolution. Reed's *Ten Days That Shook the World* recounted for an appalled and fascinated American audience the revolution that brought the Bolsheviks to power. Reed was born in Portland, Oregon, grew up in a wealthy family, and attended Harvard University, from which he graduated in 1910. After spending several years as a struggling journalist and poet, Reed began to write for progressive and socialist magazines, including the *New Review* and *THE MASSES*. Gradually, Reed became a radical labor and political activist. In 1914 he was arrested for addressing a gathering of striking silk workers in Paterson, New Jersey. Reed also spent four months traveling with Mexican revolutionary Pancho Villa, and in 1914 he published his account of the MEXICAN REVOLUTION in *Insurgent Mexico*.

By the beginning of WORLD WAR I, Reed had established himself as one of the leading radical journalists and political activists in the country. He agreed to work as a war correspondent for *Metropolitan Magazine*. During the war, Reed met and became friendly with Bolshevik leader Vladimir I. Lenin. In 1917, when Lenin and the Bolsheviks decided to move against the provisional government that had overthrown Czar Nicholas II, Reed and his wife, journalist Louise Bryant, were eyewitnesses to the October

Revolution. Reed's dispatches portrayed Lenin and the Bolsheviks in a very positive light. Carried first in the radical journal, *The Masses*, the dispatches were then consolidated into *Ten Days That Shook the World*. Reed's romanticized portrayal of the RUSSIAN REVOLUTION helped the American COMMUNIST PARTY recruit new members between 1917 and 1919, but it also earned him the hostility of American political leaders. Upon his return to the United States, Reed became increasingly active in the Communist Party; and in 1919, he became one of the leaders of the Communist Labor Party when it splintered off from the larger organization. Later that year, Reed was forced to flee the country when his affiliation with communism caused him to be charged with treason. He spent his exile helping Lenin and the newly created Bolshevik government to consolidate their power, resist Western invasions, and fight a bitter civil war. Less than a year later in 1920, Reed contracted typhus and died in Moscow at the age of 33. Reed's influence continued well after his death. His life was memorialized in 1981 when Warren Beatty portrayed Reed in the Academy Award-winning movie, *Reds*.

## religion

Between 1900 and 1930, the once seemingly unified Protestant America became a nation diverse in its religious beliefs and practices and open to new religious thought along both liberal and conservative lines. For most of the 19th century, American political leaders referred to the United States not only as a democratic republic but also as a Christian nation, by which they meant its values were those of Protestant Christianity. With the influx of the new IMMIGRATION after 1900, it was clear that Americans faced a world in which religious diversity was increasing not only among Protestants and their dissenting sects but also in the growing number of Roman Catholic, Eastern Orthodox, and Jewish citizens. New scientific discoveries, especially the theory of evolution; biblical criticism and comparative religion; and new liberal theology seemed to shake more traditional churches to their core. Some of these trends toward religious liberalism had been underway since the late 19th century. Evangelical and Pentecostal sects, renewed religious revivals, and what came to be called Fundamentalism developed at the same time.

For many conservative religious leaders, the most troubling development at the turn of the century was the

emergence of religious modernism. The scientific theory of evolution, and the life sciences and geology that supported the idea of a gradually evolving human species, threatened those who believed in the literal truth of the Bible. Liberal religious thinkers and biblical scholars expanded beyond human evolution to question the authority of biblical authors and to note contradictions in the sacred texts. They offered new interpretations about how the Bible, once thought to be the literal word of God, had been written. In addition, there was an increasing interest in world religion and in ecumenicalism, which focused on common ground among competing religious faiths. The World Parliament of Religions in 1893 led the way, but questions about the need for creed- or doctrine-based religions led to the creation of the Federal Council of Churches in 1907. Unitarians, who were among the leaders of religious liberalism for over a century, had an impact on American theology out of proportion to the number of their adherents. They, like other churches, questioned both the soundness and the efficacy of petitionary prayer, the practice of invoking the direct intervention of God. While remaining primarily theistic (that is, expressing belief in a supreme being), liberal churches began to understand many traditional religious practices as historically—not divinely—determined.

Religious liberalism found practical expression in a social movement known as the Social Gospel. As religions shifted their focus away from the mission of God on Earth to the world's problems, many leaders such as WALTER RAUSCHENBUSCH advocated practicing religion through service. His book, *Christianity and the Social Crisis* (1907), became a primary text for the social gospel movement. Developing programs to tend to the needs of the poor and indigent, the working class and the disadvantaged, ministers and lay Christians organized institutional churches such as Charles Stetzel's Labor Temple in New York, which provided social services as well as religious ones. The influence of reforming religion could be felt in the settlement house movement, in which young socially concerned men and women moved into poor urban neighborhoods to provide a range of services, from soup kitchens and relief programs to education and political and social organizations. As JANE ADDAMS argued in her autobiography, *Twenty Years at Hull-House*, the "social necessity of settlements" was not only in providing for the burgeoning needs of a poor urban population but also in offering an opportunity for the secular salvation of the settlement workers themselves.

The emergence of religious liberalism among Protestants was paralleled by developments in Roman Catholicism and Judaism. In the case of the Catholic Church, the new scientific findings and greater social consciousness had led to an opening of the church under Pope Leo XIII. His 1891 encyclical, *Rerum Novarum*, was the basis of social activism among Catholic clergy and believers for the next

50 years. It inspired the work of social activist priests such as Father John Ryan, whose book, *A Living Wage* (1906), was a poetic call for social justice. The National Conference of Catholic Charities became an institutional voice to rival Protestant poor relief. The openness to scientific thought and scriptural criticism, however, faced opposition within both the Vatican and in the United States. The threat of theological and religious modernism provoked Leo XIII and his successor, Pius X, to issue the encyclicals *Testem Benevolentiae* in 1899 and *Pascendi Gregis*, in 1907, which warned against Americanism and dismissed the findings of the new science, threatened church sanctions, and reasserted the conservative stance of the Roman church. These policies caused a retreat in theological terms within the American church, even as social activism increased.

In the United States, Catholic immigrants continued to contribute to the growth of the church nationally. The number of parishes and parishioners increased dramatically, and church schools and social services expanded. In many ways, Catholicism became an ethnically defined religion, as neighbor and community churches reflected the folk practices of their national Catholic faiths, combining ethnic holidays with religious ones and shaping religious ritual with ethnic traditions. While there were some tensions among clergy who often served an ethnically diverse community of believers, the basic tenets of faith and services in Latin bound together Catholic believers beyond the church doors.

Among those of the Jewish faith, the turn-of-the-century wave of immigration brought both new growth and increasing division. In the 19th century, American Jews, the majority of German descent, had fostered Reform Judaism. Numbering only about 150,000 in 1870, they, like their Protestant counterparts, worked to incorporate the new science and commitment to social activism. Disengaged from its historic roots, Reform Jews founded Hebrew Union College and Seminary. A Reform rabbi, Stephen S. Wise, founded the Free Synagogue of New York in 1907 and later the Jewish Institute of Religion, a liberal seminary, in 1923, as a move to modernize Judaism. Arguing for absolute freedom of the pulpit, he was a well-known orator who also worked for reform causes. For new immigrants, however, much of Reform Judaism was alien in practice and belief. Nearly two million Jews from eastern Europe immigrated to the United States between 1870 and 1914, and more than half of these settled in New York City. They brought with them the traditional practices of the shtetl (or village), and their religious leaders adhered to these practices, despite the pressures to accommodate to secular American society. Conservative Judaism and a later Reconstruction movement existed as moderating influences between the forces of Reform and Orthodox Judaism.

The growth of immigration, religious expansion among non-Protestants, and the impact of liberal theology provoked a response among conservative religious leaders beginning in the 1910s. While they, along with religious liberals, had been active in social causes such as PROHIBITION, the belief that traditional religion was losing ground caused some conservatives, such as Baptist minister William Bell Riley, founder of the Northwestern Bible School, to call upon their peers to organize against the modernists. A series of pamphlets, called *The Fundamentals*, published between 1900 and 1930, addressed the threat of the new biblical criticism and other forces such as Roman Catholicism and the study of comparative religion. At yearly conferences, conservatives laid the groundwork for the emergence of what came to be called Fundamentalism in all the major Protestant denominations. Central to its appeal was its ideological opposition to the new science, especially evolution, and its insistence on codifying religious creeds. The northern Presbyterians and Baptists faced the most serious challenge from religious reaction, but they soon defeated calls for them to abandon the historical independence of local congregations.

Fundamentalists were only one part of the evangelical revivals of the 1910s and 1920s. Holiness churches and Pentecostal sects grew rapidly, especially among Methodists and in the African-American community. The Holiness movement had its roots in late-19th-century reform within the Methodist Church. Its followers believed that sanctification, which in the Methodist Church was seen as a life-long process of salvation, could be granted immediately. The sinner would then be relieved of a life of sin. By the turn of the century, Holiness churches had become independent. One of the Holiness preachers, Charles Parham, pushed its ideas further, arguing that sanctification, or the baptism of the Holy Spirit, manifested itself in signs. In Kansas in 1901, Agnes Ozma, a student at Bethel College and Parham's follower, spoke in tongues. Another of Parham's students, William Seymour, the minister of an African-American Holiness church in Los Angeles, employed Parham's ideas in a revival that began in 1906. The Azusa Street Revival, which lasted until 1909, recruited thousands. This new evangelical turn identified itself as Pentecostalism, after the day when the Holy Spirit descended on Jesus's disciples. Speaking in tongues, faith healing, distrust of medical care, and puritanical social mores characterized the new religious movement. An interracial movement from its beginnings, Pentecostalism soon divided along racial lines. A 1914 meeting of white Pentecostals had as its mission the creation of a new religious organization and the election of leaders to the presbytery. White followers separated from the African-American Church of God in Christ to form their own denomination, later called the Assemblies of God.

The revival of Protestant evangelical religion inspired new religious activism in the political realm. Seeing a “moral breakdown” in American life, conservative Protestants called for a stop to attacks on the Sabbath, the family, moral purity, and “the right to teach our children in our own schools fundamental facts and truths.” The teaching of evolution in schools led to the passage of several anti-evolution laws in states where fundamentalists were well organized. In 1925, the *SCOPES TRIAL*, in which fundamentalists technically won their case, had unexpected consequences, including rallying liberal Christians against the backlash of Fundamentalism. The causes for the revival of traditional religion, however, are unclear. Some reacted to fears about the impact of rural-to-urban migration, which caused a decline in rural church membership and the closing of many crossroads churches. A younger, more liberal clergy staffed new, consolidated churches that were located in larger towns. To a great extent, militant Protestant fundamentalism staged a comeback in both religious and political terms in order to survive.

Fundamentalist expressions drew from the surrounding consumer culture. Evangelists such as WILLIAM “Billy” SUNDAY and AIMEE SEMPLE MCPHERSON relied on radio broadcasts, new forms of advertising, and the sale of religious literature to pay the costs of the religious life. While revivals continued to sprout in rural Protestant areas, many of the new revivalists were dependent on urban donations to sustain their ministries. Marrying new forms of Pentecostal religion to old-time Protestant faiths, McPherson and Sunday, the precursors of later-day revivalists, used faith healing, talking in tongues, and “miracles” of faith to recruit new members. They also used the language of business and sport to bring in converts.

The darker side of the fundamentalist insistence of Protestant Christian orthodoxy was its intolerance toward the beliefs of others. For some conservative Protestants, the social threat of difference led to the growth of organizations such as the *KU KLUX KLAN*, which merged a belief in white superiority, anti-Catholicism, and anti-Semitism, and general fears about strangers in American society with the language of fundamentalist Christianity. For others, the influence of religious liberals in secular life meant a conservative retreat from public activism. Not until the 1970s did fundamentalist Christians reemerge as a political force and seek to use public power to implement their religious principles.

By 1930, divisions within every major Protestant denomination, within the Catholic Church, and among Jews shifted religious disputation away from the differences among churches and toward the liberal/conservative divide in religious belief. For religious liberals, whether Protestant, Catholic, or Jew, rigorous textual criticism, an understanding of comparative religion, and social activ-

ism seemed to underline the secularization of society and the uses of religion in secular politics. For religious conservatives, the battle to retain religious influences in a secular world remained the principal challenge of the 20th century.

## Republican Party

Between 1900 and 1930, in both the White House and in Congress, the Republican Party was the dominant political party. The Republican Party’s long domination of national politics began with the crucial realigning election of William McKinley in 1896 and his reelection in 1900. In both elections, he narrowly defeated his populist Democratic challenger, William Jennings Bryan. Bryan and the Democratic Party had strong support in the South and Midwest among farmers, agrarian radicals, reformers, and populists; somewhat less securely, the party also held the loyalty of many immigrant groups. While the Republicans also had support among agrarian reformers, their strength came from support in northern cities, among eastern financial and business interests, and among middle-class men.

Mark Hanna, the chair of the National Republican Committee, solicited large campaign contributions from financial and business leaders. Hanna and McKinley viewed the great industrialists as the country’s natural leaders and gave them unprecedented access to the White House. Other financial conservatives, including Nelson Aldrich, Thomas Reed, and Thomas Platt helped shape the party’s support of the gold standard, in opposition to Democratic support of silver and more lenient economic policies. The triumph of the fiscal conservatives came in 1900 with the passage of the *CURRENCY (or Gold Standard) ACT*; industrial and agricultural interests also placed maintaining protective *TARIFFS* on the Republican political agenda as a major priority. The support of the nation’s financial and business communities was one of the consistent themes of the party’s electoral success. The party also tended to oppose American involvement in foreign affairs, to be financially conservative, and to view the role of the federal government as one of supporting industry and the general prosperity.

Relying on these issues, the Republican Party dominated the presidency and Congress between 1900 and 1930. It won presidential elections in 1900, 1904, 1908, 1920, 1924, and 1928, losing only in 1912 and 1916 to Democratic candidate WOODROW WILSON. The party also controlled the House of Representatives between 1900 and 1911 and from 1919 until 1932 and the Senate from 1900 to 1913 and again from 1919 to 1932. The party often had a large majority in both the House and the Senate, which gave it complete control over both the executive and legislative branches.

The dominance over the legislature was matched by control over the judiciary. At the national level, the party had a tremendous impact on the makeup of the Supreme Court. Of the 21 Supreme Court justices appointed between 1898 and 1932, Republican presidents appointed 18. They had a similar impact on the appointment of federal judges. The party used this control to shape federal policies on a wide range of issues, including international trade, foreign policy, labor relations, conservation, and domestic affairs. In general the party tended to support protective tariffs, and Republicans authored the historic PAYNE-ALDRICH TARIFF ACT in 1909 and the Hawley-Smoot Tariff of 1930. In general, the party also tended to favor employers in labor disputes and made an effort to keep government intervention to a minimum.

The extent to which the party maintained the support of financial and business leaders varied. Under the presidencies of THEODORE ROOSEVELT and WILLIAM HOWARD TAFT, the party was at least partially responsive to progressive demands for restraints on the power of national corporations and the new industrial elite. Roosevelt earned a reputation as a trustbuster for taking on JOHN D. ROCKEFELLER and STANDARD OIL. Roosevelt also signed progressive federal legislation such as the MEAT INSPECTION ACT (1906) and the PURE FOOD AND DRUG ACT (1906). As president, Taft continued Roosevelt's policy of trust busting and presided over the passage of the Sixteenth Amendment establishing a FEDERAL INCOME TAX. Nevertheless, Roosevelt and Taft remained strong supporters of free enterprise and big business, advocating the use of executive powers to correct only the most flagrant abuses.

The extent to which the federal government sought to police industry, support reforms, and control the economy caused a rift in the party between 1908 and 1916. Prior to 1900, agrarian radicals and progressive reformers had for a long time influenced the party. During the presidency of Theodore Roosevelt, the party's midwestern progressives and eastern financial and business backers maintained an uneasy truce. Roosevelt supported business growth, but he sought to regulate monopolies and supported limited progressive reforms. Progressives grew increasingly frustrated, despite Roosevelt's tentative commitment to a program of

reform. Conservative Old Guard Republicans maintained a firm control over Congress and blocked important reform legislation during much of the decade. A key obstacle was the conservative Speaker of the House JOSEPH CANNON. Using his control over the Rules Committee, he controlled the House of Representatives with an iron fist from 1903 to 1911.

Between 1909 and 1913, William Howard Taft initiated even more antitrust suits than trustbuster Roosevelt, but progressives in the Republican Party quickly became disenchanted with Taft's leadership. When Taft fired the head of the U.S. Forest Service, GIFFORD PINCHOT, developed closer ties with the party's Old Guard, and refused to oppose Cannon's control over the House, progressives organized to take control of the party. In June 1911, Senator ROBERT LA FOLLETTE, California governor HIRAM W. JOHNSON, and others formed the National Progressive Republican League. La Follette prepared to challenge Taft for the party presidential nomination in 1912. By 1910, however, Roosevelt had become convinced that Taft was too closely tied to business interests and the Old Guard. When Roosevelt announced that he too would seek the Republican nomination in 1912, Taft used his control of the party machinery to gain the nomination. With Taft's renomination secure, progressives bolted the party and formed the PROGRESSIVE PARTY with Roosevelt as their presidential candidate. Roosevelt outpolled Taft in the general election, but Democratic candidate Woodrow Wilson won the presidency. Most progressives rejoined the party by 1916, although some defected again to cast their ballot for Progressive Party candidate La Follette in the presidential election of 1924.

With the 1912 election of Democrat Woodrow Wilson, the Republican Party lost control of the federal government for the first time since 1896. Wilson proved to be a very effective president, winning reelection in 1916 over Republican nominee CHARLES EVANS HUGHES. He helped the Democratic Party maintain control over the House and Senate until 1919. Republican opposition to Wilson's peace program following the end of WORLD WAR I revitalized the party. Led by HENRY CABOT LODGE, Old Guard Republicans and isolationists, including some western progressives, opposed the peace treaty. Fearing that international coalitions would serve only to entangle the country in foreign conflicts, they vehemently opposed the provision of the TREATY OF VERSAILLES that required the United States to join the new LEAGUE OF NATIONS. Republican opposition ensured that the peace treaty with Germany was not ratified (a treaty officially ending the war with Germany was not signed until 1921).

With the wave of labor disputes and the economic depression that followed the war, the Republican Party was able to regain control of Congress and the presidency by

promising “a return to normalcy.” WARREN G. HARDING handily defeated Democratic nominee James M. Cox, winning 60 percent of the popular vote. The Republican Party continued its national dominance throughout the 1920s, winning every presidential election and controlling both the House and the Senate. Republican presidents Harding, CALVIN COOLIDGE, and Herbert Hoover championed fiscal conservatism, a smaller role for the federal government, lower taxes, and an emphasis on continued industrial development and economic growth. On that platform, they retained power until the economic crisis of the 1930s.

### Rhinelander case (1924)

The Rhinelander case was a widely publicized scandal involving a young interracial couple who met in September 1921 and married in October 1924. Interracial marriage was neither usual nor remarkable in the 1920s; but the Rhinelander case was different. The scandalous marriage and the subsequently spectacular divorce trial that followed seized the attention of the masses and became fodder for the “jazz journalists” of the 1920s. Leonard Kip Rhinelander, the bridegroom, was the son of an elite family that was listed in the *Social Register*. His father, Philip Rhinelander, owned a real estate business and controlled millions of dollars. Alice Beatrice Jones was the daughter of mixed-race parents and of more modest birth. Her father, whose racial credentials were at issue, had been a manservant in England, and her white mother also earned her living through domestic service. Alice Jones had worked as a nanny before she met and married Kip. The dizzying ascent of a young mixed-race woman from domestic service to the *Social Register*, in whose pages she briefly appeared, was one reason why the marriage caught the eye of ambitious reporters; the other reason was how race played out in a public trial that became a national spectacle.

After WORLD WAR I, race relations in the United States were becoming increasingly hostile and contentious. The GREAT MIGRATION had changed the racial makeup of northern cities; workers competed over industrial jobs, and businesses actively encouraged competition among ethnic groups over jobs and wages. Returning African-American soldiers brought with them expectations of greater freedom, and many white southerners reacted violently to the sight of black men with guns. Race riots in several cities

both during and after the war only intensified hostility and suspicion between groups. NATIVISM and anti-Catholicism similarly reappeared, a change in temper that increased demand for restrictive IMMIGRATION laws and AMERICANIZATION campaigns. The popularity of D. W. GRIFFITH’s film, *BIRTH OF A NATION*, also contributed to the culture of racism, even as the KU KLUX KLAN reemerged in the rural South and began to prosper in the urban North as well. Other racial confrontations suggested that those African Americans who fought back against segregation and discrimination would be subjected to prosecution from white mobs but also from the authorities, who often shared the racial views of the crowd.

This heightened atmosphere of racial fear and antipathy was the context for Kip Rhinelander’s suit for divorce from his wife, Alice. Pressured by his father to end his two-week-old marriage, Kip Rhinelander filed for an annulment, based on the theory that he did not know his wife was not white until after they were married. The divorce trial quickly became a circus. Some reporters for the tabloids alternately portrayed Alice Jones as willfully duplicitous and Kip Rhinelander as a willful dupe while others viewed Rhinelander as a cad and Alice Jones as an innocent victim. The proceedings included the testimony of movie star Al Jolson, who denied having propositioned or even met Alice, after she had claimed he’d done both, and a ritualistic disrobing of the spurned wife, the purpose of which was to prove that Rhinelander must have known his wife was not white. The record of their relationship, including premarital trysts and visits to Alice Jones’s parental home, made the public question Kip Rhinelander’s story. An all-white jury of men listened to the proceedings for weeks before rendering a verdict in two days of deliberation. They decided in favor of Alice Jones, who was awarded both immediate compensation and a lifetime annuity from Rhinelander. Neither remarried.

Needless to say, when the eugenics standard of “one drop” was sufficient to convict men and women of violating the Virginia RACIAL INTEGRITY ACT, the marriage of an elite white man to a mixed-race woman not only raised eyebrows but strengthened the resolve of those who fought integration on a larger scale. *Rhinelander v. Rhinelander* suggested that race was a deeply hidden secret in American culture, the signs of which were disguised in other forms. Race was also the major social conflict of the time. As W. E. B. DUBOIS wrote in *The Souls of Black Folk*, “the problem of the twentieth century [was] the problem of the color line.” While racial mixing stirred the imagination of novelists and filmmakers, sexual relationships and lasting marriages between blacks and whites intensified opposition to social integration North and South. The challenge would be whether Americans could move beyond the prejudices of the past and achieve a more racially egalitarian society.

**Rockefeller, John Davison** (1839–1937) *industrialist and philanthropist*

Born in Richford, New York, to Eliza Davison Rockefeller and William Avery Rockefeller, an itinerant medicine peddler, John D. Rockefeller attended country schools and spent a year at Owego Academy before his family moved to Ohio. He attended high school for two years in Cleveland and started his business career there in 1855, when he obtained a bookkeeping job after three months' training at a commercial college. When he was only 18, he became a partner in a commission house. In 1863, four years after oil was first tapped by a well in Pennsylvania, Rockefeller and two partners bought into the oil refining business. In 1865 Rockefeller and his partners established their own refinery, where Rockefeller could be "daring in design" and

John D. Rockefeller (Hulton/Archive)

"cautious in execution," a formula he used throughout his career. From the beginning, he kept careful records of costs and profits that informed him where his business stood.

Setting out to monopolize the petroleum industry, the partners added a second refinery. In 1870 they replaced their partnership with a joint-stock firm, the STANDARD OIL Company (Ohio). In 1882 it became the Standard Oil Trust, with 40 allied firms controlling 90 percent of American refineries. Its monopoly was declared illegal by the Ohio Supreme Court in 1892. Starting that year and ending in 1899, Standard Oil operated as a community-of-interest combination of 20 firms. From then until 1911 when the Supreme Court declared it in violation of antitrust laws, Standard Oil acted as a holding company, the Standard Oil Co. of New Jersey. Through the years, Standard Oil acquired its own warehouses, shipping facilities, tank cars, pipelines, and barrel-making plant and managed to cut the unit costs of refining oil almost in half, while extending the market for petroleum by-products.

The guiding genius behind Standard Oil, John D. Rockefeller pioneered the modern corporation. He has been called the "greatest business administrator America has produced." Although he often forced competitors to sell or to join his alliance, he seldom bankrupted them and occasionally treated them leniently. He paid his employees well and ruled his operation by consensus.

Efficient and benign within Standard Oil, Rockefeller's passion to bring order out of chaos in the infant oil industry made him ruthless in eliminating competitors. Although well informed, he often feigned ignorance of the tactics of terror and espionage employed against rivals by his underlings. Rebating was the most effective weapon Standard Oil used to force competitors to join it or be ruined. The huge volume of its shipments enabled it to secure from competing railroads discounts of up to 50 percent of the published freight rates. At times it even got "drawbacks," or rebates, on oil shipped by some competitors. Rockefeller's marketing practices ranged from shrewd to unscrupulous. By the 1890s the company marketed 84 percent of all petroleum products sold in America and produced a third of its crude oil. Later those percentages were reduced by new oil fields, stronger competitors, and more effective federal anti-monopoly legislation.

Rockefeller was a man of contradictions. He was determined to be both rich and virtuous. He was both a predatory businessman, trying to prove he was the fittest by surviving his competitors, and a church-going Baptist who aimed "to promote the well-being of mankind throughout the world." He was devoted to his wife, Laura Celestia Spelman, whom he married in 1864, and to their children, four of whom lived to adulthood.

Tooth and claw business practices, however, made Rockefeller extremely unpopular, and his reputation and that

of Standard Oil was further damaged by Henry Demarest Lloyd's *Wealth Against Commonwealth* (1894) and even more by muckraker Ida Tarbell in her 1902–03 series on Standard Oil, first published in *McClure's Magazine*. Having ignored hostility and been anonymous in his giving (for example, he established the University of Chicago and gave it \$35 million with no strings attached), Rockefeller hired a publicist to broadcast his good works and tag his gifts with his name.

No longer active in his company's decisions after 1895, Rockefeller concentrated on his philanthropic work, giving away \$550 million in his lifetime (\$450 million of which went for medical research). Believing that the prevention of disease was more important than its relief, he was willing to fund pure research for generalized future benefits. In 1891 he endowed the Rockefeller Institute for Medical Research; the next year the General Education Board, which became the world's foremost educational foundation; in 1913 the Rockefeller Foundation, the world's largest grant-making foundation and the country's main sponsor of medical science, medical education, and public health; and in 1918 the Laura Spelman Rockefeller Memorial. Many of these programs were later consolidated in the Rockefeller Foundation. The benefits of Rockefeller-funded research were mind-boggling, even surpassing those of the later World Health Organization. Among them were the actual elimination of hookworm, the virtual eradication of yellow fever, and the revitalization of medical schools and medical research throughout the world. Rockefeller outlived his enemies and his reputation improved when his giving became public knowledge. He distributed over a billion and a half dollars, making Rockefeller the greatest philanthropist in American history.

—Olive Hoogenboom

**Roosevelt, Theodore** (1858–1919) *vice president, 26th U.S. president*

The son of Theodore Roosevelt and Martha Bulloch, future president Theodore Roosevelt, Jr., was born in New York City on October 27, 1858. Renowned as an advocate and exemplar of the manly virtues of physical fitness, military action, and adventure, he came into the world as a small, asthmatic, near-sighted boy. As the younger Roosevelt matured, he became an amateur naturalist, an interest expressed later in his conservationism. In 1876 Roosevelt entered Harvard, where he was unpopular due to his enthusiasm for studies in natural science. After graduating, he published a naval history of the War of 1812, the first of a long series of writings that would come from his pen. He was married twice, first to Alice Lee, the mother of

President Theodore Roosevelt (left) with John Muir (*Library of Congress*)

his daughter Alice Roosevelt Longworth, and later to Edith Carow, who gave birth to their five children—Theodore, Kermit, Ethel, Archibald, and Quentin.

In 1882, Roosevelt began his political career when he was elected to the New York State Assembly on the REPUBLICAN PARTY ticket. He was a freshman representative but did not play the part. Roosevelt startled the assembly by calling for an investigation of the state's Attorney General Hamilton Ward and Supreme Court Justice T. R. Westbrook, who failed to prosecute millionaire Jay Gould for manipulating stock of the Manhattan Railway Company. While the subsequent inquiry into the Westbrook scandal revealed no wrongdoing, Roosevelt earned a reputation as a reformer.

The emotional devastation caused by the death of his wife Alice and his mother on February 14, 1884, forced him to relinquish his seat and retreat to his ranch in the Dakota Territory. Politics called him back east in 1886, when the Republican Party, fearing that independent candidate Henry George might lead New York to a second Paris Commune, tapped Roosevelt to run for mayor. On Election Day, Roosevelt finished last in a three-way race, with many Republicans voting for the Democratic candidate and winner Abraham Hewitt. His candidacy, however, laid the groundwork for later political races. In 1889, President Benjamin Harrison appointed Roosevelt head of the Civil Service Commission, where he championed the merit system over the patronage system. Amazed that border patrolmen were tested for their spelling and arithmetic and not their riding skills and marksmanship, Roosevelt revised the

Civil Service examinations to assess practical skills, rather than theoretical knowledge.

In 1891 Roosevelt published his *History of New York City*. Its publication attracted the attention of the reform mayor of New York City, William L. Strong, who appointed Roosevelt police commissioner in 1895. The New York Police Department of the 1890s was rife with corruption. To improve the force's morale Roosevelt established the practice of handing out medals for exemplary service. He also modernized the police communications by developing a telephone call box system. His zealotry proved to be his undoing. In an effort to stop police extortion, he vigorously enforced the city's blue laws, which forbade the sale of alcohol on Sundays. Many saw his efforts as a form of class prejudice and a war on working-class recreation. Public support evaporated. He was saved from being driven from office when the McKinley administration appointed him to the position of assistant secretary of the navy in 1897. At the Navy Department, Roosevelt was an ardent and unabashed expansionist. He took advantage of Navy Secretary John Long's frequent absences to reorganize the administration of the navy in preparation for war with Spain. While President McKinley considered how to respond to the sinking of the USS *Maine* at Havana, Roosevelt told the chief executive that war was the only option "compatible with national honor."

After the declaration of war on Spain, Roosevelt resigned his post and accepted the rank of lieutenant colonel in the First Volunteer Cavalry Regiment soon to be known as the Rough Riders. Although they were trained as mounted riflemen at their base in San Antonio, Texas, they arrived in Cuba bereft of their horses because of transport problems. After landing at Daiquiri, Cuba, they were instrumental in pushing the Spanish back in skirmishes at Las Guasimas and El Caney. Six days after landing, Roosevelt and his regiment distinguished themselves in action outside Santiago by helping to take Kettle and San Juan Hills. Due to heavy rifle fire, losses among the Rough Riders were heavy; but by that afternoon, the army was in possession of the two strategic hills. After the war ended, Roosevelt returned home a hero; and in 1899, he was elected governor of the state of New York. As the state's chief executive, he ran afoul of his chief sponsor, Senator Thomas C. Platt, by supporting the Ford Bill, which placed a tax on any corporation owning public franchises. After thwarting efforts by Platt's followers to bury the bill in committee, Roosevelt signed the bill into law. After serving one term as governor, Roosevelt was elected in 1900 as William McKinley's vice president. The assassination of McKinley in 1901 elevated Roosevelt to the presidency.

Roosevelt's administration was known for its strong stands in favor of conservation, regulation of the trusts, and an assertive FOREIGN POLICY. Repudiating the country's

tradition of isolationism, Roosevelt had lobbied for U.S. intervention in Cuba and the Philippines under McKinley's administration. As president, he moved to show American strength in Latin America and the Pacific by issuing the ROOSEVELT COROLLARY to the Monroe Doctrine, jockeying to build the Panama Canal, and sending the GREAT WHITE FLEET to Japan. In addition, he mediated an end to the RUSSO-JAPANESE WAR (for which he won a Noble Peace Prize) and disputes in Venezuela, the Dominican Republic, and Morocco; and he sought to guarantee American interests in Asia with the ROOT-TAKAHIRA AGREEMENT and the GENTLEMEN'S AGREEMENT with Japan that assured peaceful relations by eliminating school segregation of Japanese immigrant children in the United States in return for a voluntary cessation of emigration from Japan.

Roosevelt preferred to work out national problems and needs through cooperative arrangements between private and public interests and to strengthen the hand of the federal government in domestic affairs, a political philosophy that he called the NEW NATIONALISM, echoing progressive Herbert Croly. Domestically, Roosevelt's preference for a stable economy and a strong national government led to his intervention in the ANTHRACITE COAL STRIKE of 1902, the prosecution of monopoly trusts such as the railroad holding company in the NORTHERN SECURITIES CASE and STANDARD OIL, and the passage of government regulation of industry in the ELKINS ACT and HEPBURN ACT, the MEAT INSPECTION ACT, and the PURE FOOD AND DRUG ACT. Roosevelt's conservationism expressed itself in the passage of the ANTIQUITIES ACT, the NATIONAL RECLAMATION ACT, and the creation of the NATIONAL PARK SERVICE.

During his nearly eight years in the White House, Roosevelt expanded the powers of the office and became a model for the modern presidency. While he refused to run for a second term in his own right, Roosevelt's discontent with the conduct of his self-chosen successor, WILLIAM HOWARD TAFT, led to a failed presidential campaign as the PROGRESSIVE PARTY nominee in 1912. The death of his son Quentin during WORLD WAR I left Roosevelt devastated. He died in 1919.

### Roosevelt Corollary

In an extension of the Monroe Doctrine, the Roosevelt Corollary claimed the right of the United States to intervene in the affairs of its neighbors in the Western Hemisphere if

they were unable to preserve domestic order on their own. In an annual address to Congress in 1823, President James Monroe had articulated what became known as the Monroe Doctrine, stating that the United States would not permit European powers to colonize independent nations in the Western Hemisphere. In 1904, President THEODORE ROOSEVELT extended the Monroe Doctrine with his own corollary.

Roosevelt used the corollary as a rationale for his intervention in the crisis of the Dominican Republic. Even though revolutionaries had overthrown a corrupt government in the Dominican Republic in 1903, the new government still was unable to make payments on its \$22 million debt to European nations. Citing the Roosevelt Corollary, the American administration took control of Dominican customs. Under American receivership, 45 percent of the country's revenues were distributed to Dominicans and the rest sent to foreign creditors. This arrangement lasted for more than three decades.

Having absorbed Cuba as a protectorate as a result of winning the Spanish-American War of 1898, the United States granted it independence in 1902. But Cuba became independent only after the new government agreed to abide by the Platt Amendment, which gave the United States the right to intervene in the affairs of Cuba if its independence were threatened by any foreign power. In 1906 Roosevelt intervened in Cuba when a rebellion undermined the stability of the country. American troops landed on the island, suppressed the rebellion, and stayed in the country for three years.

As an extension of Roosevelt's BIG STICK DIPLOMACY, the Roosevelt Corollary dramatically altered American foreign policy. It signaled a shift from merely intending to safeguard the Western Hemisphere against European intervention to openly promising U.S. intervention if Latin American countries were unable to keep their domestic affairs in order.

### Root-Takahira Agreement (1908)

The Root-Takahira Agreement of 1908 came about as a result of the desire of the United States to protect its interests in Asia and to ease tensions between America and Japan. The RUSSO-JAPANESE WAR of 1904–05 had tested the resolve of American administrations to enforce the OPEN DOOR POLICY in Asia. At the time, Japan saw Russia's military presence in Manchuria as a direct threat to its own economic and territorial expansion. On February

8, 1904, the Japanese navy destroyed the Russian fleet in a surprise attack at Port Arthur. By 1905, the Japanese army had defeated the Russians at Mukden, where 97,000 Russian soldiers died, and the navy had sunk the Russian fleet in the straits of Tsushima. But Japan had drained its financial and military resources. On May 31, Minister Kogoro Takahira asked President THEODORE ROOSEVELT to negotiate a peace treaty with Russia and Japan.

Seeking a balance of power to protect American interests in the region, Roosevelt invited representatives from the two countries to meet at Portsmouth, New Hampshire, on August 9, 1905. In the Treaty of Portsmouth, the Russians acquiesced to most of the Japanese demands. They agreed to allow Japan to take over the Liaodong Peninsula and the railroad from Harbin to Port Arthur. They conceded to the withdrawal of American troops from Manchuria, and they accepted Japanese freedom of action in Korea. The two parties stalemated on the issue of Russia ceding the island of Sakhalin. Czar Nicholas II then agreed to divide the island when Roosevelt wired the Czar to propose a partition between the two parties. Even though the czar refused to pay the indemnity that Japan demanded, Japan accepted the terms of the treaty on August 29.

In the aftermath of the war, Japan emerged as the dominant naval power in the Pacific, and relations between the United States and Japan eroded. Domestic problems in California heightened tensions between the United States and Japan. In addition to pushing for an extension of the Chinese Exclusion Act (1882, 1892, and 1902), nativist white workers in San Francisco demanded that Japanese immigrants be legally excluded. When the San Francisco school board voted to require Asian children to attend a separate "Oriental School" in 1906, anti-Asian riots broke out in California and WILLIAM RANDOLPH HEARST's papers published inflammatory stories about the "Yellow Peril."

Roosevelt eased tensions with Japan by making two agreements with the country. First, the president reached the GENTLEMEN'S AGREEMENT with Japan. In exchange for Japan agreeing to stop the flow of its immigrant laborers to the United States, Roosevelt agreed to have the school board withdraw its mandate for a separate school. Second, the two countries reached an understanding in the Root-Takahira Agreement of 1908. In the agreement, the United States and Japan promised to accept the territorial status quo in the Pacific. In addition, the two nations agreed to abide by the Open Door and to uphold the territorial integrity of China.

Even though Roosevelt saw the Root-Takahira Agreement as evidence that Japan did not plan to act aggressively against the United States, American leaders favorable to China saw it as a sanction of Japanese territorial expansion in Asia. To ensure that Japan abided by the agreements,

the president sent a bold message of American military strength by ordering the GREAT WHITE FLEET, composed of 16 naval ships, on a world tour that stopped by Japan.

## rural life

Although often depicted in idyllic and pastoral fashion, rural life in the early 20th century witnessed much strife, hard work, and perseverance as American society underwent sweeping social and economic transformations. Frequently, this period in American history has been presented from the perspective of those at the center of these economic changes—urban dwellers, laborers, immigrants, or capitalists. But it is also useful to consider the daily lives of those on the periphery of the major economic changes taking place, men and women in rural communities. The major social and economic changes that rural areas faced during the early part of the 20th century stemmed from the rapid urbanization of American society, the growth of mass production industry, and the growing power of corporations in economic life.

Throughout many rural communities, the emergence of the United States as an urban nation brought many fears to rural residents. Rural America long had embraced the values of Protestantism, and the advent and triumph of more secular urban culture threatened to undermine the values that rural dwellers held dear. Still, rural communities also received radio waves, national magazines, and mail order catalogs that invited them to participate in the emerging consumer culture. Many within rural communities feared cities, because they viewed them as breeding grounds for atheism, sexual license, and radicalism. Despite rural reaction to consumer culture, the young of rural communities faced declining opportunities to own their own farms or even find a job. They continued to vote with their feet by migrating to urban centers for school and work.

The economic changes taking place meant that banks and agricultural corporations, or agribusinesses, had a new hold on rural life. The growing presence and power of corporate monopolies gave farmers places to borrow money from, market their goods, or buy crop insurance. It threatened their sense of local autonomy, and rural residents had to decide on the best course of action. New forces were at work, as mail-order catalogs and government agents challenged their ability to shape and control the communities in which they lived.

Increasingly after 1900, urban-industrial America became the most prosperous sector of society, and its consumer culture and commodities steadily penetrated the countryside. Although farmers had difficulty raising capital and lacked banking facilities, currency, and credit during the 1890s, the new century brought a wave of prosperity to rural areas that would last until shortly after the end of WORLD WAR I. The increasing demand for agricultural products and better transportation to foreign markets meant farmers had new opportunities to market their goods. As a result, the U.S. Department of AGRICULTURE estimated in 1920 that the average rural family had income to buy consumer goods such as clothing and foodstuffs. It produced only 40 percent of what it consumed, down from 60 percent 20 years earlier.

During this “Golden Age” of agriculture, farmers spent most of their newfound income on consumer goods to improve their standard of living. For instance, they often made their homes more livable by buying carpets, drapes, wallpaper, vacuum cleaners, and new furniture. They also found themselves installing such modern conveniences as electricity, indoor plumbing, or a telephone. HENRY FORD targeted rural families as a prime customer for his Model T, which sold for about \$240. While many rural residents, especially farmers, found work-related uses for the Model Ts they purchased, they were used as well for leisure and play. Beyond buying an automobile, many farmers, having witnessed the economic difficulties of the late 19th century, remained hesitant to invest in capital improvements, whether in expanding their landholdings or in purchasing new technologies.

The populists and farm organizations such as the American Farm Bureau long had championed the need for low-interest loans to help promote and make affordable the capital improvements needed to expand individual farms. Before the United States entered the First World War, the federal government responded to this demand, recognizing that the growing market for American agricultural goods while Europe was at war, required an expansion in farm production. Few farmers expanded their operations prior to the war, meaning that average farm size remained flat between 1900 and 1916. In an effort to overcome this obstacle, the FEDERAL FARM LOAN ACT created the mechanism to extend low-interest loans for periods of five to 40 years to farmers through the control of a Federal Farm Loan Board—12 Federal Land Banks that paralleled the Federal Reserve Banks. As part of WOODROW WILSON’s NEW FREEDOM initiative, the Federal Farm Loan Act extended loans to farmers through a program that cut out private banks, which farmers viewed as outside institutions that easily exploited vulnerable farmers.

Although the First World War had created an expanded market for American agricultural goods and brought the

A rural farm family (Library of Congress)

means to borrow capital for expanding landholdings, the cessation of hostilities in Europe caused the market to contract. When farm production in Europe resumed, governments faced a capital shortage as they rebuilt their war-torn nations. Imports were down. With shifting market conditions during the 1920s, agricultural prices in the United States steadily declined. While lower prices for many consumer goods such as automobiles resulted in increased demand, most people did not purchase more bread as its price dropped. Many rural residents and farmers, accordingly, faced economic crisis well before the onset of the Great Depression late in 1929. Some 500,000 individuals lost their farms to bankruptcy during the 1920s. In response, farmers made persistent demands for relief from the federal government during the course of the twenties. As rural residents faced growing economic hardships, some responded by attacking what they perceived to be the

immorality of urban America. Accordingly, rural residents provided strong support for many of the movements that came to characterize American society by the 1920s: PROHIBITION, KU KLUX KLAN, IMMIGRATION restriction, and religious fundamentalism. At the same time, farmers also organized the FARMER-LABOR PARTY in the Midwest and farm organizations such as the American Farm Bureau to demand that the government address the problems of rural America.

**Russian Revolution** (1917)

Radicals in the United States and around the world were inspired by the Russian Revolution of 1917, a popular revolution led by socialists in a country previously ruled by an autocracy. WORLD WAR I had broken out between the major powers in Europe in 1914, but by 1917, peasant soldiers were deserting the Russian army en masse, and their government collapsed. In the February Revolution of 1917, Russian liberals and leftists established a provisional government that was weak and inexperienced. In the October Revolution, the Bolsheviks, led by Vladimir Lenin and Leon Trotsky, launched a coup and seized the Winter Palace, the last stronghold of the provisional government.

At the same time as the Bolshevik government declared itself a dictatorship of the proletariat, it faced internal enemies and a looming external threat as well. Lenin concluded that the Bolsheviks needed an armistice to protect the domestic revolution and allow revolution to spread throughout Europe. On March 3, 1918, Russia and Germany signed the Treaty of Brest-Litovsk, which ended Russian participation in the war.

Fearing that the new communist government would destabilize eastern Europe, the western Allies (Britain and France) pressured the United States to intervene. When a civil war broke out in Russia, the United States sent an expeditionary force (the SIBERIAN EXPEDITION) to assist any opposition to the Bolshevik army in the summer of 1918. Some of the American troops stayed there until April 1920. The Bolsheviks won the civil war and maintained their power, but the world revolution Lenin had hoped for never came to fruition. When Lenin died in 1924 after suffering from several strokes, Joseph Stalin succeeded him, consolidated his power, and eliminated his enemies, expelling Trotsky from the country by 1929. The United States refused to formally recognize the government of the Soviet Union until 1933, when diplomatic relations were restored.

The Russian Revolution had a significant influence on radicalism in the United States. In the postwar period, the United States experienced unprecedented labor unrest. More than four million workers went on strike in 1919. A strike wave began in Seattle, when shipyard workers walked off their jobs. The action spread into a general strike that paralyzed the city. In the SEATTLE GENERAL STRIKE, workers and war veterans formed councils of workers, soldiers, and sailors in several industries, declaring that they had established these Soviets to practice managing the economy.

In the United States, postwar hysteria against communism was accentuated when the Bolsheviks founded the Third International (or Comintern) in 1919 to export revolution around the world. When the COMMUNIST PARTY

(CP) was founded in 1919, both the CP and Communist Labor Party claimed to have nearly 70,000 members. During the war, many radicals had left the INDUSTRIAL WORKERS OF THE WORLD (IWW) and the Socialist Party when they had been weakened by domestic repression. The Justice Department had targeted both socialists, who saw the war as a meaningless conflict between capitalist nations, and radical syndicalists in the IWW for their criticisms of militarism that had the potential to disrupt war production in the western lumber and copper industries. More than a thousand opponents of the war had been convicted for sedition and espionage.

Fears of domestic Bolshevism heightened when a series of bombs exploded in the spring of 1919. In November 1919, the attorney general, A. MITCHELL PALMER, mounted the first Palmer Raid. On New Year's Day in January 1920, at the peak of the RED SCARE, the federal government rounded up 6,000 radicals in one night. Federal agents thought that they would find caches of weapons and explosives, but they found only three pistols and no dynamite. Although most of the arrested radicals and aliens were released eventually, about 500 of the detainees who did not have U.S. citizenship were deported. In the absence of labor militancy, the Red Scare dissipated by the summer of 1920.

Although antiradical and antiimmigrant sentiments had been persistent throughout American history, the Russian Revolution illustrated to some American leaders that communism was a real threat in the world. The fear of communism remained a salient feature of American society throughout the 20th century.

At the same time, the concrete example of the Russian Revolution created a division on the American Left. On the one hand, for some progressives and leftists in the United States, the revolution provided an example of the benefits of a worker-controlled state and a rationalized economy. Furthermore, when the United States refused to recognize the new government and intervened in the Russian civil war, some on the American Left saw the Soviet Union as a victim in the face of capitalist intervention. On the other hand, liberals and leftists criticized Lenin's signing of the armistice with Germany, because it increased Allied casualties by allowing the Germans to devote more of their troops to the western front in Europe. In addition, many on the American Left condemned the undemocratic actions and brutality of the Bolsheviks in the Soviet Union.

The contradictions of the Russian Revolution produced diverse reactions in the public and on the Left in the United States. The revolution gained praise among radicals as a concrete example of a socialist state in the 20th century. At the same time, it created a rift on the American Left and provoked anticommunist hysteria in the American public.

### Russo-Japanese War (1904–1905)

The Russo-Japanese War was a conflict between Russia and Japan that grew out of competing imperialistic designs on Manchuria and Korea. In the late 1890s, the Russians had negotiated with China for the right to extend the Trans-Siberian Railway across Manchuria and thus secure a strategic base at Port Arthur. This base was designed to be the headquarters of Russian naval power in the Pacific. Russia had stationed troops in Manchuria during the BOXER REBELLION in 1900, but it had promised to remove them, a promise it broke. The Japanese, who also had expansionist plans in the region, went to war with Russia before the railway was completed.

Japan tried to negotiate a division of Manchuria into “spheres of influence,” but Russia was unwilling, blinded by the belief that Japan would be defeated and a looming internal Russian revolution could be averted by a Russian victory. For Japan, Manchuria and Korea in Czarist Russian hands was like a gun pointed at its strategic heart.

In early 1904, Japan broke off negotiations, and on February 6, it severed diplomatic relations with Russia. Two days later, Japan attacked Port Arthur and bottled up the Russian fleet. Port Arthur fell in January 1905. Japanese troops had a series of victories under General Oyama at Shenyang in February and March 1905, and the destruction of the Russian fleet by Admiral Togo’s fleet in May 1905 astounded the world. It was the first time an Asian power had defeated a European power in modern times. It established Japan from that time on as a major player in world affairs.

As the war went on, Japan began to run short of both men and money. Japanese officials approached President THEODORE ROOSEVELT secretly and requested that he sponsor peace negotiations. He agreed and gathered the two sides together at Portsmouth, New Hampshire, in

1905. The Japanese demanded a large indemnity and the island of Sakhalin, considered a strategic location. The Russians, for their part, refused to concede. Roosevelt was frustrated, admitting that he wanted to “give utterance to whoops of rage,” but instead he pushed through an agreement in which the Japanese received no indemnity and only the southern half of Sakhalin.

For his efforts, Roosevelt received the Nobel Peace Prize in 1906. The cost was that America’s relations with Russia were now in danger. Japan also felt wrongfully deprived of an indemnity by the agreement, and Japan and America soon became rivals in Asia. The Russo-Japanese War also produced a migration of Japanese laborers into California as dislocations and the tax burden of the war in Japan made America more appealing. By 1906, almost 70,000 Japanese lived along the Pacific Coast.

People in California became afraid of the “yellow peril.” An international crisis was created when local San Francisco school authorities declared that Asian children had to attend a special school. The Japanese saw this as blatant discrimination, and they were deeply offended. Theodore Roosevelt took matters into his own hands and invited the school board to the White House to convince them to repeal the measure to avert an international conflict. An agreement was then worked out between Japan and America to stem the tide of emigrants from Japan. Lest Japan think that America was afraid of it, Roosevelt ordered the GREAT WHITE FLEET on a voyage around the world. When the fleet was met by cheering Japanese school children, it allowed for a diplomatic atmosphere necessary to carry out the ROOT-TAKAHIRA AGREEMENT, in which the United States and Japan pledged to respect each other’s territorial possessions in the Pacific and uphold the OPEN DOOR POLICY in China.

—Annamarie Edelen

### Sacco and Vanzetti

Nicola Sacco and Bartolomeo Vanzetti were Italian immigrants convicted in a controversial murder case and executed in 1927. Supporters of Sacco and Vanzetti argued that their conviction and subsequent execution was based largely on their nationality and political views, and the pair quickly became martyrs for those on the political Left. The actual murder and trial took place at the height of the RED SCARE when labor militancy and political reaction were at their postwar peak.

Largely kept in check during WORLD WAR I, labor militancy and political radicalism intensified following the RUSSIAN REVOLUTION and the return of unemployment in 1919. Political and business leaders insisted that a Red Menace was spreading throughout the country. The backlash against labor militancy and radicalism culminated in the arrest and deportation of suspected socialists, communists, and anarchists in the Palmer Raids of January 1920. In the midst of this ferment, Sacco and Vanzetti were accused of killing two men and stealing \$16,000. Despite substantial evidence of their innocence, the pair were tried, convicted, and sentenced to death. Supporters were convinced that their only crime had been that they were anarchists.

Amid intense repression, the conviction of Sacco and Vanzetti became a rallying point for militant unionists and political radicals. The INDUSTRIAL WORKERS OF THE WORLD (IWW), the INTERNATIONAL LADIES' GARMENT WORKERS UNION, the COMMUNIST PARTY, and the Workers' Party raised money and held mass demonstrations calling for the release of the two men. Supporters warned that unless workers, radicals, intellectuals, and others united they could expect the same fate.

The case of Sacco and Vanzetti, however, was more than simply a rallying cry for the nation's radicals. It outraged many in the political mainstream who concluded that the case was weak and motivated by anti-immigrant sentiment. Harvard Law School professor and future Supreme Court justice Felix Frankfurter noted that the case against

Sacco and Vanzetti was based largely on the "systematic exploitation of the defendants' alien blood, their imperfect knowledge of English, their unpopular social views, and their opposition to the war." As the date of their execution neared, massive demonstrations took place. On July 7, 1927, 20,000 took part in a New York demonstration. On August 10, the day Sacco and Vanzetti were to be executed, over 200,000 workers walked off their jobs. Other protests, demonstrations, and strikes took place throughout the country.

Despite international appeals for clemency, Sacco and Vanzetti were put to death on August 23, 1927. Debates about the innocence or guilt of Sacco and Vanzetti raged in the decades after their execution, but they seem to have been resolved by William Young and David E. Kaiser's authoritative account, *Postmortem: New Evidence in the Case of Sacco and Vanzetti* (1985). After careful reconstruction of the evidence, Young and Kaiser concluded that, without a doubt, Sacco and Vanzetti were innocent. Because of the circumstances of the case and the widely held belief that the pair were innocent, the case is still cited by many as evidence of the excesses of the Red Scare and the rampant hostility and suspicion of immigrants that characterized the 1920s.

**Further reading:** William Young and David E. Kaiser, *Postmortem: New Evidence in the Case of Sacco and Vanzetti* (Amherst, Mass.: University of Massachusetts Press, 1985).

—Robert Gordon

**Sanger, Margaret** (1879–1966) *birth control activist*  
Born on September 14, 1879, in Corning, New York, Margaret Louise Higgins (Sanger) became the foremost BIRTH CONTROL advocate of the early 20th century. The sixth of 11 children of Anne Purcell and Michael Hennessey Higgins, her father was the owner and operator of a stone monument business. As the child of an Irish-American father,

Margaret Sanger (Library of Congress)

she was early introduced to the ideas of Robert Ingersoll and Henry George, the Single Tax advocate. Margaret went to Claverack College, a coed preparatory school in upstate New York. Originally, she took a teaching job but left it when she was called home to nurse her mother. After her mother's death, she entered nursing school at the White Plains (New York) Hospital. In 1902, Margaret finished her degree and married William Sanger, an architect. The next few years, she recovered from ill health to give birth to her two sons, Stuart and Grant, and a daughter, also called Margaret. Sanger became discontented and she and her husband moved to the Lower East Side of New York, where they became active in the radical community. Active in the INDUSTRIAL WORKERS OF THE WORLD (IWW), Sanger helped ELIZABETH GURLEY FLYNN evacuate the children during the LAWRENCE STRIKE, an act that aroused national sympathy for the embattled textile strikers.

Sanger was a practicing nurse whose professional work brought her to understand the lack of control women had over their own bodies. She supported the idea that women needed the freedom to control their own life and body. From the first issue of her magazine, *Woman Rebel*, in

March 1914, to the financial and organizational support she gave to hormone research after World War II, she was dedicated to bringing effective birth control to women around the world. She became known in radical circles for her support of sexual reform and her advocacy of working-class women's need for information on venereal disease, birth control, and sexual practice.

Sanger brought information to the public by remaining in the spotlight. The public relations strategy she used helped to create awareness and challenge regulations and laws that suppressed the free circulation of contraceptive information. She created a pamphlet, *Family Limitation* (1914), which gave advice to women about various birth control methods. She also included the names and addresses of places where women could write for further information or purchase necessary items. She even included a recipe for the home production of vaginal suppositories. This pamphlet had two important features. First its straightforward approach was notable because of her focus on the working class, whose hardships were increased by low wages combined with excessive fertility. Sanger also criticized the use of coitus interruptus as a contraceptive device, indicating that it deprived women of sexual satisfaction. She clearly communicated more than technical information in her pamphlet. Sanger advocated the right of women to sexual enjoyment as well as control over their own bodies. It was this pamphlet that led to her prosecution under the Comstock laws, during which she fled to Europe.

In 1916 Sanger opened the first birth control clinic in Brooklyn, New York. The clinic faced many obstacles, the most important of which was staunch opposition from the medical profession. New York State law specified in Section 1142 that no one could give information to prevent conception to anyone for any reason. Additionally, Section 1145 stated that only physicians could give advice to prevent conception for the cure or prevention of disease. That same year, Sanger and two of the clinic's staff members were arrested for violating the state law. All the clinic's records were confiscated. In 1919, Sanger changed her emphasis from women's control of their own bodies to eugenic reasoning about the need for better babies. She joined in supporting the ideas of eugenicists who sought to improve the human race by selective breeding and sterilization of those thought unfit on the grounds of low intelligence or a propensity for crime and shiftlessness. For the most part, though, Sanger focused her efforts on educating the public and lobbying for the legalization of birth control. Continued opposition to birth control required political compromise with the medical establishment. Jealous of their own authority in the medical realm, doctors could support Sanger once she accepted that they should have the final authority in providing birth control. This shift in

emphasis increased Sanger's following and made birth control a respectable issue.

From the Great Depression to the 1960s, Sanger played a less vital and visible role in the birth control movement. In part, the ground had shifted, and birth control, once a feminist issue, was now seen largely in terms of family planning. Concern about the world population crisis, however, revived Sanger's reputation, and she took part in the founding of the International Planned Parenthood Foundation. Throughout her life, she had been devoted to improving methods of contraception, and in the 1950s, she helped raise funds to support the development of the birth control pill, which was first made available in 1960. Sanger died at a nursing home in Tucson, Arizona, in 1966.

### ***Schenck v. United States* (1919)**

During WORLD WAR I, both Congress and state governments passed laws that restricted the right of free speech in order to ensure support for the war effort and to suppress what the government considered harmful dissent. *Schenck v. United States* was a court case testing the constitutionality of the ESPIONAGE ACT (1917) and its amendment under the SEDITION ACT (1918). These acts made it a crime to speak against the government, oppose the military draft, or act in any way that could be construed as giving aid and comfort to the enemy. *Schenck* was only one of a series of cases during the war that raised the specter of government suppression of civil liberties, including the rights to free speech and right of conscience. In *Schenck* as in *Frohwerk v. United States* (1919), *Abrams v. United States* (1919), and *Gitlow v. New York* (1924), the U.S. Supreme Court had to decide what was the extent and meaning of the First Amendment protection of free speech. Socialists who opposed U.S. entry into the war in Europe, radicals arrested under criminal syndicalism laws, German Americans who published in their native language, and militants supporting the Russian Revolution became the targets of state and federal prosecution. Challenging the laws were individuals who continued to advocate draft resistance, oppose bond sales, or criticize the nation's entry into or pursuit of the war.

In the *Schenck* case, the defendants, members of the Socialist Party, had printed and mailed 15,000 pamphlets opposing CONSCRIPTION and American entry into the war. When the lower courts found them guilty, *Schenck* and

Baer appealed their convictions to the Supreme Court. Lawyers in the case argued for the absolute right of citizens to freedom of speech and conscience. OLIVER WENDELL HOLMES, the chief justice, wrote the Court's opinion, which decided in favor of the government. Arguing that the freedom of speech was not unlimited, Holmes used the analogy of a man crying "fire" in a crowded theater as an illustration of how speech acts could endanger communities. It was the context of speech that determined whether or not it was protected. The "clear and present danger" of the war, Holmes argued, made subversion out of free speech uttered in the name of individual conscience. Mailing anti-conscription pamphlets and condemning the government's participation in the war were a threat to a nation at war.

Ironically, Justice Holmes, who wrote the majority opinion in *Schenck*, became within a few months a dissenting defender of First Amendment rights. Arguing against the majority in *Abrams v. United States* and subsequent cases, Holmes essentially defined the modern view of the First Amendment and civil liberties. He wrote that it was the "theory of our Constitution" that "the ultimate good desired is better reached by the free trade in ideas—that the best test of truth is the power of the thought to get itself accepted in the competition of the market." The nature of our experiment in democracy required us to be "eternally vigilant against attempts to check the expression of opinions that we loathe," unless such speech represented an imminent threat.

Coming as it did at the end of a divisive war, *Schenck* had a sobering effect on the Left. The decision represented a conservative assessment of the powers of the state to override personal liberties and to restrict individual rights. At the same time, the case gave renewed importance to free speech struggles, as *Gitlow v. New York* (involving a New York criminal syndicalism statute) and a later case, *Near v. Minnesota* (on press censorship), took on questions of whether citizens were free to hold and promote unpopular political views and whether state and federal governments had the authority to silence dissenting voices.

### **science**

By 1900, science in the United States—whether social, life, or physical sciences, theoretical or applied—was established as a profession. The expansion of universities and the development of specialized curricula opened doors for research scientists, and the creation of research laboratories in private industry (General Electric Research Laboratory, for example) or sponsored by private foundations

(the Carnegie Institute of Washington, the Rockefeller Foundation, and the Institute for Advanced Study at Princeton University) increased demand for university-educated scientists and engineers. The debate over Darwinism continued politically, as shown in the SCOPES TRIAL, but general acceptance of evolutionary theory meant that the war between RELIGION and science remained at a standstill. The growth of government, especially in the arena of social policy, also created opportunities for the new fields of sociology, anthropology, political science, and history. Leaving behind dependence on European science, scientists in the United States developed new scientific applications and, what was more, contributed to new scientific theories in the realms of chemistry, mathematics, biology, and astronomy. Married to the new philosophy of PROGRESSIVISM, with its promotion of rational social planning and detailed investigation, “science” became shorthand for the use of scientific method and technological solutions to solve human problems. Faith in science furthered the popularity of industrial reforms such as SCIENTIFIC MANAGEMENT and the adoption of eugenic theories in BIRTH CONTROL, SOCIAL WORK, and IMMIGRATION policy. It would be decades before the ideology of science was undermined by social realities.

Thomas A. Edison (Library of Congress)

In 1900, theoretical science remained under the dominance of European scientists. In the field of physics, Planck developed quantum theory in 1900, and Einstein published his theory of relativity in 1905. Science in the United States had seen its primary accomplishments in the field of applied science, but this was to change. Already the United States had become known for its accomplishments in astronomy. It had the largest number of observatories and the most powerful telescopes in the world, and some of its most important scientists, such as George Ellery Hale, were known for their work on planetary and lunar orbits. American scientists were on the verge of major breakthroughs in other theoretical and applied fields. Improved scientific and medical education gave rise to a new generation of scientists in university and private research laboratories. By linking more theoretical and obscure research with practical application, scientists were able to expand their research through private gifts and grants, new facilities, and larger resources. This investment seemed to pay off with the awarding of the Nobel Prize to Albert Michelson in 1907 for his experiments in the measurement of light and spectography and to Theodore Richards in 1914 for his work on atomic weights. Science in the United States had come of age.

By this time, bacteriological advances had already improved life expectancy with the discovery of the origins of common diseases such as diphtheria, cholera, and tuberculosis. New work on tropical diseases such as yellow fever and malaria enlarged the reputation of American medicine. The funding of the Rockefeller Foundation furthered these efforts as medical researchers turned their attention to other diseases such as hookworm. Advances in MEDICINE and in medical education stimulated other research as well.

Genetics as a field grew in stature with the work of Edmund Beecher Wilson and Nettie Stevens in 1904 on the chromosomes that determine sex and that of Thomas Hunt Morgan on mapping genes, based on his work with fruit flies, in 1920. In the succeeding decade, geneticists would work on isolating genes to improve crops through crossbreeding. Theories of genetics had other purposes. Under Charles Davenport, the federal government created a Eugenics Record Office in 1910 to build a database in human heredity. While later discredited for its racial assumptions and political uses, eugenics science had obtained enough respectability to be used to underwrite new restrictive immigration policies and to support the use of sterilization by relief agencies and institutions for the care of the mentally ill. The hope that one could improve the human species through selective breeding attracted some social thinkers who sought a more rational and controlled human environment.

New scientific discoveries in such fields as physics and astronomy fueled the public imagination. The Science News

Service, created by newspaper magnate E. W. Scripps, kept newspaper and journal readers informed about scientific developments as did the magazines such as *Scientific American*, *Popular Science*, and *Popular Mechanics*. The popularity of inventors such as Thomas Edison and Alexander Graham Bell inspired new series novels such as the Tom Swift stories about a boy inventor, which began publication in 1910. Politicians echoed the popular support for science and the public faith in the ability of science to address social and political ills. President THEODORE ROOSEVELT declared in 1908, “applied science, if carried out according to our program, will succeed in achieving for humanity, above all for the city industrial worker, results even surpassing in value those today in effect on the farm.”

The popularity of science and its policy applications can best be seen in research on the ENVIRONMENT. Utilizing theories of land utilization, conservation groups proposed and passed such bills as the NATIONAL RECLAMATION ACT and supported the creation of a NATIONAL PARK SERVICE as a way of shepherding the nation’s natural wealth. The National Conservation Commission, first proposed in 1908, conducted a long-delayed inventory of the nation’s natural resources. Management of forests and conservation of mineral sources, land reclamation, and protection of waterways were among the results of the joint work of scientists concerned with the environment and the Roosevelt administration. While divided between advocates of efficient, rational use and the champions of preservation, conservation policy was shaped by the interplay between the new science of ecology and calls for scientific management.

In many ways, science and expertise became substitutes for popular control and common knowledge. Just as scientific management had replaced the skilled workers’ control over how he or she produced goods, so too did experts in a range of fields—from land conservation to social welfare—take precedence over popular opinion and political control. In the rational society, scholarly objectivity and supposedly “value-free” science trumped the interests lurking behind popular demands and partisan agendas. However, experts in city planning, social work, and immigration shaped policies in ways that encroached upon or directly violated the neutral ideal. Scientific objectivity proved illusory, although it would take decades to discover the problem. The DILLINGHAM COMMISSION, influenced by the science of eugenics and a prejudicial belief in racial superiority, ignored its own findings to promote an immigration policy that restricted the entry of southern and eastern Europeans into the United States. Conservation debates altered the outcome of scientific research as eugenics did social policy.

WORLD WAR I was the turning point of the takeoff in government and private funding for scientific research. Defense needs activated private industrial and university

research laboratories to work on such projects as improving submarine detection, developing chemical gases and treatments for military use, optical glass, and improvements in aerial photography, mapping, and accuracy in aerial bombing. Improved sanitary engineering, medical research on wounds, and psychological studies of battle fatigue were other products of scientists’ support for the war effort. Members of the National Academy of Science, most notably astrophysicist George Ellery Hale, supported the creation of the National Research Council, which became a permanent peacetime body in 1919.

By the 1920s, expanded government and private industry support had cemented the position of theoretical and applied science as a priority in education, public policy, and funding. Only through continued innovation could the United States maintain its economic superiority; only through new technologies could the country hope to defend itself in a future war. Practical applications, however, rested on the support of theoretical science on the one hand and more widespread public EDUCATION in science on the other. Public opinion was key; so too was the encouragement of new generations of scientists through the improvement of science education in the schools. These trends would continue to elevate scientists throughout the period and guarantee a future for scientific research.

## scientific management

A system to make industrial production more efficient, scientific management came to dominate business in the early decades of the 20th century and eventually became part of American culture. Emerging predominately from the work of FREDERICK WINSLOW TAYLOR, scientific management was based on the idea that every task could be broken into a series of smaller tasks. Each individual task was then studied to determine the fastest and most efficient method for completing the task. The entire production process could then be split into specialized tasks, each done at peak efficiency. The end result was the creation of a production system in which workers became specialists at individual tasks but had no knowledge of the entire production process. The assembly line was the most

significant manifestation of scientific management. This movement to make scientific studies of processes evolved out of its industrial beginnings and took a place in other areas of American life.

The drive for efficiency of production was a response to the production system that relied on individual workers to complete a variety of tasks. It was also an attempt to reduce the power of individual craftsmen who could hold up production by striking because skilled replacements were difficult to find. Once the production process was broken into specialized tasks, any worker could complete them given just a few hours of training. American industrialists thus saw scientific management as the answer to many of their labor troubles. In a way they hoped to remove the human element from certain portions of the production process. Workers did not have to learn new skills nor did they have to unlearn anything to function in a scientifically managed production process. They simply had to perform the same task repeatedly for the entire workday.

Industrialists took the tenets of scientific management further than specializing the production process. They redesigned whole factories to make production more efficient. By moving machinery, for example, they could decrease the time spent transporting parts within the factory. Employers also tried to use scientific management principles in the hiring of workers by establishing personnel departments. Personnel departments then established criteria for hiring new employees. The goal of this was to avoid hiring workers who could not keep up the pace or would refuse to work in those conditions.

Many workers did protest the advent of scientific management. They argued that the managers' expectations for daily output were inhumane, and many protests erupted over the implementation of scientific management. In some instances workers were able to temper the implementation of scientific management, but they were unable to stop it completely, as it came to define MASS PRODUCTION in the United States.

Scientific management made its way into other parts of American life. Education adopted many of its principles in restructuring curricula, building schools, and attempting to develop an efficient citizenry in which each individual would be prepared for his or her proper place in the social order. Other businesses besides factories turned to scientific management. Department stores tried to make their operations more efficient by studying the actions of clerks. Offices were redesigned to make them more efficient. All of these actions were based on the ideal that individuals could be made to act more efficiently. This ideal, first developed in the early decades of the 20th century, has played a significant role in American industry and in the way Americans analyze various problems.

### **Scopes Trial** (1925)

The Scopes Trial was the climax of a conservative backlash against the teaching of evolution and featured a legal battle between two of the great orators of the day, lawyer CLARENCE DARROW and populist Democrat William Jennings Bryan. The spread of institutions of higher learning and of mass media had made more visible long-standing divisions in American society. By the early 1920s, differences over such matters as biblical interpretation and the scientific method developed between modernists and cultural conservatives who feared that modernization was undermining traditional American values and institutions. The rift took place at every level, but it had an important impact on EDUCATION and RELIGION. As the scientific method established supremacy in the nation's classrooms, traditionalists and religious conservatives dug in their heels, often splintering political alliances that had formed in the 1880s and 1890s. In 1925, these divisions came to a head in a test case of antievolution laws. Opponents of Charles Darwin and evolution, led by William Jennings Bryan, had succeeded in passing antievolution laws in 15 states. Supporters of evolution and free speech advocates, including the American Civil Liberties Union (ACLU), looked for a high-profile case to test the constitutionality of these laws.

Residents of Dayton, Tennessee, were more than willing to participate in this high-profile case. Several prominent Dayton residents hoped that the trial might put the town in the national spotlight and stem the tide of people

Scopes Trial lawyers Clarence Darrow (left) and William Jennings Bryan (Hulton/Archive)

leaving the town for places with greater economic opportunities. John Scopes, who routinely taught evolution in his high school biology course, agreed to test the legitimacy of the Tennessee law forbidding the teaching of evolution. Almost immediately, the case became highly politicized and thrust Dayton into the national spotlight. Within a matter of days thousands of people from all political and religious perspectives, along with a huge contingent of newspaper reporters, invaded the city, creating a carnival-like atmosphere. The ACLU reluctantly agreed to allow the controversial and flamboyant Clarence Darrow to head a strong defense team while Bryan put together an equally impressive team of prosecutors. Bryan and the prosecuting attorneys argued that what was really at stake was the survival of Christianity, the Bible, and traditional American values.

Over the course of the trial, Judge John T. Raulston, who was openly sympathetic to Bryan and the prosecution, allowed the prosecution great latitude while refusing to allow Darrow and the defense team to call scientific experts to assert the validity of evolution. Despite being hamstrung by Raulston's rulings, Darrow's impassioned defense of Scopes and evolution won him widespread praise from outside observers and national reporters, including H. L. MENCKEN. The climax of the case came when Darrow ruthlessly questioned Bryan, who took the stand as a biblical scholar, about whether or not the Bible should be interpreted strictly. Darrow, who severely weakened Bryan's credibility, convinced the jury to find Scopes guilty, in order for the law to be sent before the state supreme court. Although the jury found Scopes guilty and fined him \$100, the ruling was overturned on a technicality. It wasn't until 1968 that the Supreme Court in *Epperson v. Arkansas* ruled that antievolution statutes were unconstitutional.

### Seattle General Strike (1919)

In February 1919, nearly 100,000 workers went on strike in Seattle, Washington, in support of striking shipyard workers. The strike assumed great nationwide significance because of its timing. The Bolsheviks had seized control in Russia the previous year and Europe had witnessed a number of leftist uprisings in the aftermath of WORLD WAR I. The walkout by the Seattle workers without specifically stated complaints led many observers, both in Seattle and around the United States, to fear that the workers of Seattle were only the first to revolt against the American

economic and political system. Although the general strike lasted only from February 6 to February 11, it had significant consequences for labor.

One reason that the strike's failure assumed such significance was that Seattle had one of the strongest labor movements in the country. Many observers noted that Seattle was basically a closed-shop town, where workers had to join unions in order to work. Although affiliated with the AMERICAN FEDERATION OF LABOR (AFL), Seattle's unions often challenged the AFL leadership. Seattle's workers generally supported the idea that workers should be organized by industry instead of by craft. The AFL was strongly opposed to industrial unionism. Seattle's workers also displayed strong class consciousness. They saw themselves as members of a distinct class based on their positions as wageworkers within the capitalist economic system.

Fear of radicalism was rampant in many sections of American society, especially after the Bolshevik revolution and civil war, and socialist uprisings in Germany and Hungary in 1919. In Seattle the authorities had been battling the INDUSTRIAL WORKERS OF THE WORLD (IWW) who still had a strong presence in the West. The Seattle AFL went on record in support of the Bolsheviks in the struggle for power in Russia. Waterfront workers even refused to load-war material being shipped to anti-Bolshevik forces in Russia.

The immediate cause of the general strike was a strike by shipyard workers. During World War I, the U.S. government established the Emergency Fleet Corporation to oversee the production of ships. This quasi-governmental agency controlled the inputs to shipbuilding such as steel and the price of labor. Seattle's shipyard workers argued that the wage levels were too low and warned that after the war they would take action to raise their wages. Two weeks after the armistice, they made good on their pledge by notifying the Emergency Fleet Corporation and the shipyard owners that the unions would negotiate directly with the shipyard owners. By November 1918, the Seattle Metal Trades Council, a body made up of representatives from the trades working in the shipyards, had authorized a strike if their wage demands were not met. Negotiations began in January 1919 but bogged down because the Emergency Fleet Corporation ordered shipyard owners not to give in to the worker's demands.

With their demands for wage increases unmet, 35,000 shipyard workers went on strike on January 21, 1919. In support of the striking shipyard unions, the Seattle Central Labor Council, a body made up of representatives from all of Seattle's unions, passed a resolution calling for a general strike. Unions throughout Seattle responded quickly by voting in favor of the general strike. A mass meeting of workers on February 2 approved the general strike and official notice appeared in newspapers the next day stating

that the strike would begin on February 6. A sense of crisis descended upon Seattle. The business community and middle classes feared the worst in light of recent happenings in Europe. The mayor of Seattle, Ole Hanson, tried to intermediate between the two sides but was unsuccessful. On February 6, 1919, the general strike began as 60,000 workers walked off their jobs.

Despite the lack of violence, Seattle's newspapers portrayed the strike as a revolution seeking the overthrow of the economic, political, and social order. The Central Strike Committee made two mistakes that allowed this to happen and led to the strikers losing the propaganda battle. First, the Central Strike Committee never set any goals or a time limit for the strike. They were on strike simply for the vague purpose of supporting the shipyard workers. It was unclear what would lead the workers to end the strike. This lack of focus allowed their opponents to imagine their motives. The most popular was that the general strike was meant to begin the permanent revolution of the working class in the United States. Shipyard owners, the press, and the Seattle mayor popularized this view of events that made it seem vitally important that the strikers be defeated. The Central Strike Committee's second mistake was their decision not to continue publishing Seattle's labor newspaper. As their only means of telling their side of the story, the strikers' decision not to use the paper silenced their collective voice. The loss of the propaganda war, the opposition of Seattle's mayor who threatened to call in troops to establish martial law, and the difficulty in keeping all the workers united behind the strike when the purpose was vague, led to the strike's failure. It lasted only until February 11.

The failure of the strike had a profound effect on Seattle's labor movement. Local authorities cracked down on the IWW, suppressing the radical voice in Seattle's labor movement. Feuding arose among the different factions of the labor movement as each tried to blame the others for the failure. In addition, Seattle's employers undertook a powerful open-shop campaign in the strike's aftermath. This transformed Seattle from an almost entirely closed-shop city to an open-shop town.

The strike also had national ramifications. In the eyes of many, the general strike was a harbinger of things to come if employers and the government did not take action against the workers. The response on the part of employers took the form of the open-shop movement that came to define management-labor relations in the 1920s. The strike also helped usher in the RED SCARE. Ole Hanson resigned as mayor and undertook a speaking tour of the country, during which he related how he had faced down the workers' revolution in Seattle. In this effort to bolster his own reputation, Hanson exaggerated the threat posed by the strikers. His speeches and the other accounts of the strike by Seattle's newspapers convinced many readers, however,

that they now faced a red menace. The chilly climate for labor in the 1920s was the result.

### Sedition Act (1918)

Enacted during the crisis of WORLD WAR I, the Sedition Act was part of an effort to suppress domestic opposition to the entry of the United States into the war. With the outbreak of war in Europe in 1914, the Wilson administration, in an effort to ensure unity, steadily moved to restrict the civil liberties of its citizens. Even as it declared the United States neutral in the conflict, it began to prepare for war. In early April 1917, when President WOODROW WILSON asked Congress for a declaration of war against Germany, he also called upon Congress to pass legislation that would enforce the loyalty of all Americans to the country's role in the war. In response, Representative Edwin Webb of North Carolina and Senator Charles Culberson of Texas began to craft legislation that would give the president the ability to impose "stern repression" to ensure unity behind the nation's emerging war effort.

The ESPIONAGE ACT, as it was known when their legislative attempts were finally enacted in early June 1917, furnished the government with ample power for the suppression of those who opposed the war. It imposed stiff fines (between \$5,000 and \$10,000) and jail sentences of up to 20 years for individuals convicted under this legislation. The following year, Congress further restricted the ability to challenge America's participation in the war with the passage of a series of amendments that came to be known as the Sedition Act (May 1918). These amendments prohibited "any disloyal, profane, scurrilous, or abusive language about the form of government of the United States, or the Constitution of the United States, or the flag of the United States, or the uniform of the Army or Navy."

Combined, the Espionage Act and the Sedition Act went far beyond simply attempting to prevent spying for the enemy. Instead, their main effect was to make it illegal to write or utter any statement that could be construed as profaning the flag, the Constitution, or the military. The legislation stifled most domestic opposition to the war. The extreme nature of these legislative acts constituted the most drastic restriction of free speech since the enactment of the Alien and Sedition Acts of 1798. The Socialist Party of America and the INDUSTRIAL WORKERS OF THE WORLD (IWW) had emerged by 1917 as the most vocal and organized forces opposing America's involvement in the war in Europe. Accordingly, they quickly became among the first

groups to feel the strong arm of the legal system. Under these two laws, some 6,000 arrests were made and 1,055 convictions were obtained. In 1919, the Supreme Court upheld the constitutionality of this legislation in its ruling in *Abrams v. United States*. Both pieces of legislation expired in 1921.

## segregation

Segregation is the physical separation of individuals, usually based on their race, class, gender, or religion. Segregation can be either *de jure*, created by law, or *de facto*, meaning resulting from practice. In the early 20th century, both kinds of segregation came to define racial relations in the United States. Segregation resulted in the restriction of the civil, political, economic, and social rights of African Americans, Asian Americans, Mexican Americans, and NATIVE AMERICANS throughout the nation.

Segregation was a tool used by whites to separate themselves from nonwhites as Americans redefined race. During the first decades of the 20th century, Americans adopted the modern definition of race based on skin color, which underlined the belief that any nonwhite person was inferior. In addition, this gave rise to the belief that nonwhite Americans posed a threat to the physical and moral health of the nation. Proponents of segregation argued, therefore, that it was necessary to separate the less advanced racial groups from the whites.

Native Americans were the first minority group to face segregation. Segregated on reservations and subject to the rules of the Federal Bureau of Indian Affairs, they faced restrictions on their education, occupational choices, and access to proper health care. Other racial groups experienced increased segregation early in the 20th century.

Segregation of African Americans, many have assumed, was a natural legacy of slavery and the Civil War. Southern states did not, however, establish the system of laws requiring segregation known as Jim Crow immediately after the war. African Americans enjoyed the right to vote and hold political office and used public facilities such as railroads and theaters alongside whites. Some states and cities had laws segregating public spaces, but nothing on the scale that came to dominate race relations in the South after 1890. At the end of the 19th century, the South was reeling from a number of economic, political, and social crises that led to the passage of segregation laws. The end of slavery had not ended racial prejudice and violence. The South, with other regions, experienced its first industrial depres-

sion during the 1890s. The Populist Movement had created political conflict between whites of different economic classes, each of which sought African-American allies. Many southern whites looked for a remedy for society's ills. Segregating African Americans became the answer in the eyes of many.

Prior to the end of the 19th century, a number of factors limited the ability of southern states to completely segregate society on racial lines. By the turn of the century, however, southern whites were given, in the words of historian C. Vann Woodward, "permission to hate." Under the influence of conservative jurists, federal courts no longer broadly interpreted the Fourteenth and Fifteenth Amendments to the Constitution, which granted equal protection under the law to African Americans and gave black men the right to vote. Instead, judges repeatedly ruled that the restrictions on discrimination applied only to the actions of states and not individuals. In 1896, in *Plessy v. Ferguson*, the Supreme Court ruled that separate facilities were not inherently unequal. This decision allowed states, companies, and individuals to segregate public spaces such as waiting rooms by race, while arguing that the separate facilities were equal.

Political changes also affected race relations. Northern liberals dropped their opposition to racist policies in an effort to unify the nation. In the South, militant populists frightened whites with their appeal to small southern farmers, both white and African-American. The conservative political element in the South abandoned its traditional policy of racial moderation to attack the populists with charges of race mixing. By manipulating the vote in African-American areas, the conservatives defeated the populists in the 1896 elections. These events had significant consequences. Conservatives assumed the mantle of white supremacy in their battle for political power and did not turn back. Many agrarian activists blamed the African Americans for their defeat in the elections and turned to white supremacy.

The final development leading to segregation was the change in American racial attitudes arising from its imperialist ventures. In 1898, the United States took control of Hawaii and the Philippines, bringing eight million people of color under its jurisdiction. The federal government argued that the Philippine people were not capable of governing themselves. Northern politicians, who supported the domination of the Philippines, stood on shaky ground when criticizing southern racial attitudes.

By the 1890s, southern states had begun to pass Jim Crow laws restricting the social and economic rights of African Americans. By 1910, every southern state had segregated railway stations in which African Americans and whites waited in separate rooms. Between 1901 and 1907, 10 states segregated public transportation, requiring African Americans to sit in the rear. States segregated

African-American children learning washing and ironing at Whittier Primary School, Hampton, Virginia, 1900 (*Library of Congress*)

hospitals, prisons, theaters, workplaces, and cemeteries. Parks had separate areas for African Americans. Mobile, Alabama, passed a curfew law that required African Americans to be off the street by 10 P.M. Florida and North Carolina required that separate textbooks be used for African-American students, and Florida required the two sets of books to be stored separately.

A complex racial etiquette accompanied the legal restrictions imposed on African Americans. Whites expected African Americans to demonstrate their inferior social status through outward signs of deference. African Americans were not to look whites in the eye. When walking on the same sidewalks, African Americans were to move into the road to allow whites to pass. African Americans were forced to call whites "Mister," while whites called African-American men "boy," or by their first names. This system of racial etiquette was backed by force. Any African American who violated the cultural rules faced punishment ranging from intimidation and physical beating to death. Lynching became a southern racial phenomenon during the period from 1900 to 1910 as white southerners fought to enforce segregation.

Segregation was not, however, solely a southern phenomenon nor was it enacted solely against African Americans. Minorities throughout the United States faced segregation in their residential choices, their jobs, and their use of public space. In the West and Southwest, Asian Americans and Hispanics faced segregation. Most of the segregation outside the South was *de facto*, although some states and municipalities passed laws to segregate members of certain ethnic groups. In 1906, for example, the San Francisco Board of Education segregated all Korean, Chinese, and Japanese students. By 1913 the state of California had passed a law prohibiting the sale of real property to all noncitizens, an act aimed at Asian Americans. Even in the absence of such laws, whites often acted to prohibit the sale of property in certain areas of cities to nonwhites. Whites who did not want African Americans or Mexican Americans living in their neighborhood, for example, simply terrorized them into moving out. Another strategy was to include in property deeds a racial covenant that prohibited the sale of the property to nonwhites, a practice that was also used to deny Jewish Americans residence in many neighborhoods. Discrimination in housing led to the cre-

ation of ethnic ghettos in cities with their own schools and businesses. Many labor unions refused to accept nonwhites, which restricted the occupational choices of nonwhites.

By 1930, African Americans, Native Americans, Asian Americans, and Hispanics in most regions of the country lived in segregated neighborhoods, faced restrictions in their use of public spaces, and found their choice of work severely limited. Whether it came through the Jim Crow laws of the southern states or the cultural attitudes of northern whites, segregation was the tool by which white Americans repressed nonwhites.

### Selective Service Act (1917)

The Selective Service Act was the law passed by Congress in order to raise troops for the U.S. entry into WORLD WAR I. Facing a requirement specified by General JOHN PERSHING, commander of the AMERICAN EXPEDITIONARY FORCE, to recruit 3 million men to alter the outcome of the war, men from the ages of 21 to 31 filled out their draft registration cards on June 5, 1917. More than 24 million men responded to the call, and local draft boards selected 6,400,000 of them to serve in the military. Hundreds of thousands more volunteered before the draft could call them up. No exemptions were allowed outside of those needed for vital wartime production. No one was allowed to hire a substitute, a difference from the Civil War practice.

President WOODROW WILSON had tried to rely on a public call to arms, as had been the tradition since America's inception. In the Civil War, there had been antidraft riots, and Wilson was anxious to avoid social unrest. Many warned that the streets would run red with blood. On the actual day, however, most registered patriotically.

General Enoch Crowder was chosen head of the new Selective Service System. Under it, the local draft boards were organized to deflect criticism for selection from the federal government. George Creel, a social reformer, headed the committee. Using advertising methods, his

committee convinced Americans to leave their isolationism behind and protect democracy from Germany.

Behind the legislative mechanism for preparedness was a network of organizations and individuals who had led the way for selective service. First, the PREPAREDNESS movement at the outbreak of the conflict in Europe tried to convince Americans of the need to improve military capability. Through literature, programs, and training camps, advocates urged the Wilson administration and the populace to take the German threat seriously. Events, especially German submarine warfare, aided their efforts until war was declared. The COMMITTEE FOR PUBLIC INFORMATION, created by President Wilson shortly after the United States joined the war in 1917, raised public support for the war effort through propaganda. War posters, marching bands, and billboards celebrated those who "did their duty." A darker side of the CPI encouraged and spread fear of Germans and German spies who, they said, had infiltrated the United States. Thanks to the CPI, the nation stood as one behind its war effort.

Locally, communities gave their soldiers farewell parties and parades. Draftees met citizens and loved ones waving flags, with bands playing farewell songs and girls spurring them on to victory against the dreaded Hun. Back at home, citizens bought liberty bonds, grew victory gardens, and worked in war factories to further the war effort. Some served in the Red Cross, helping to alleviate human suffering in the United States and abroad. They assisted over 300,000 American families with financial troubles and sought to ease the grief of families who had lost their relatives in war. America sent more than 13,000 of its women as Red Cross nurses overseas.

### sexuality

The years between 1900 and 1930 witnessed fundamental changes in sexual mores and practices, including an increase in premarital sex and the use of BIRTH CONTROL, a reorientation of marriage toward companionate relationships, a rising divorce rate, and the emergence of distinct gay and lesbian identities. There was a shift from Victorian silence about the body and sexuality to the emergence of a new psychological language about sex. On the margins of mainstream society, sexual radicalism transformed the ways that middle-class and elite intellectuals arranged their private lives. And new venues for leisure where men and women could meet and share entertainment such as movie

theaters, dance halls, and amusement parks, brought a shift in the average American's experience of courting and sexuality. So, too, did the introduction of the automobile and the new youth culture.

The Victorian era had brought with it a sharp divide in social expectations of men and women. Men were supposed to be active, public, and sexual creatures while women—apart from prostitutes and the morally depraved—were assumed to be passive, domestic, and asexual in nature. Such differences and the demand that women remain protected and pure led to practices of social life and leisure in which men and women were segregated from each other. By the turn of the century, however, these patterns had changed. Men and women mingled in the new workplace and also after work when they sought RECREATION and popular entertainment.

Along with such changes in social life came changes in sexual practice. Courting among single men and women had long focused on polite, heavily chaperoned visits in parlors, small social gatherings, and front porches. The boundaries of this social world began to change with the emergence of a new YOUTH culture, in which young men and women were encouraged to meet each other outside the family circle. Changed attitudes toward sexuality were reflected in an increase in the occurrence of premarital sex and the use of birth control. For the generation born before 1900, only 14 percent of women (about one in seven) admitted to having premarital sex before they were 35. Among women in the generation of the 1920s, however, more than one in three (36 percent) had experienced premarital intercourse. With public activism on the issue of birth control, women gained new access to contraceptives. New birth control clinics provided advice and contraceptive devices, so that by 1925 one study reported that more than 80 percent of middle-class women used birth control. In contrast, only about 36 percent of poorer women did.

In a new urban culture, single men and women worked out sexual lives and identities not all of which ended in novel-like marriages. The dance halls, speakeasies, pool halls, and recreational clubs opened up alternatives to family life for both heterosexual and homosexual men and women. A new gay subculture, with a separate identity, began to emerge for men in the tearooms and clubs as well as on the streets; among women, freedom from family could mean the possibility of relationships not only with men but with women. At the same time, the Society for the Suppression of Vice sought to prosecute the public and private acts of those seen as deviant. Police in many cities cracked down especially on gay men whose sexual conduct differed from the norm.

On average, most men and women refrained from marrying until their early to mid-twenties. A prolonged period of courtship preceded marriage, and married couples often

had widely different expectations about marital sex. New ideas about marriage, however, began to alter the experience. By the 1910s, men and women, reading the work of sex theorists such as HAVELOCK ELLIS and psychologist SIGMUND FREUD had different beliefs in and practices of sex than had their parents. Many also developed greater expectations for what marriage might be. They emphasized that couples could be companions and share the joys and burdens of marital life. They also gave new attention to happiness, including sexual happiness, in marriage.

Rising expectations increased pressure on men and women who married to achieve the new ideal of companionate marriage. Individuals and couples came to expect more from each other than their parents had, wanting an economic and sexual union to also be fulfilling in emotional terms. The hopes many had for marital life, however, frequently led to disappointment. As many states started to reform divorce laws and make it easier for couple to attain a divorce, the divorce rate rose. Those who married expecting happiness could now file for divorce on more ambiguous grounds such as mental cruelty; and many chose to do so. Also true was that rates of remarriage rose in response.

In what was called the first sexual revolution of the 1920s, these trends came together to create more open attitudes about heterosexual relationships both inside and outside marriage. The widespread adoption of the automobile in recreation opened the way for its use in courtship and sexuality. Mass-market magazines such as *True Confessions* and romance novels spread the language of companionate marriage and new modern sexuality, and new styles of DRESS and cosmetics brought the “sex appeal” of ADVERTISING into daily view. Still, new methods of birth control, smarter, sexier language, and the new availability of divorce did not change the double standard of morality between men and women. Women continued to be ostracized within their communities for violating strict norms of female virtue. While these standards varied according to race, class, and region, respectable women had to remain free of the taint of immorality and illegitimacy. The new emphasis on heterosexual relationships also stigmatized those who remained outside traditional monogamous marriage and deepened social prejudice and hostility toward gay men and lesbian women. The widening scope of traditional sexual relations stirred doubts about the psychological stability of celibate, unmarried, and homosexual men and women.

### Sheppard-Towner Act (1921)

The Sheppard-Towner Maternity and Infancy Act was the first federal program for social welfare. It was introduced into Congress in 1919 and signed into law by President WARREN G. HARDING on November 23, 1921. The Sheppard-Towner Act set up a federal administration that disbursed funds to individual states for the purpose of improving the health of America's children. Originally set to expire in 1926, the act was renewed for an additional two years, but Congress allowed it to expire in 1928. Despite its brief tenure, the act improved the health of millions of American children.

The Sheppard-Towner Act emerged out of the efforts of Progressive Era reformers to improve the health of America's children. The U.S. CHILDREN'S BUREAU had been researching infant health since 1913. It discovered that the U.S. infant and maternal fatality rates were among the highest in the industrialized world. The studies of the Children's Bureau suggested that better infant and prenatal care might have prevented half of the infant and child deaths. In addition, during WORLD WAR I, one-third of American men were rejected by the draft board for medical reasons. These findings highlighted the need for better infant and maternal health care. Reformers also feared that state and local programs ignored women and infants in rural areas. To solve these problems, child welfare reformers, led by the Children's Bureau, began a campaign to establish a federal program that would standardize child and maternity care across the nation.

The law passed in 1921 named the Children's Bureau as the federal department in charge of overseeing state health programs. Each state's legislature had to vote acceptance of the act. By June 1922, 42 of the 48 states had accepted Sheppard-Towner funding. After a state voted to accept federal funds, it received \$5,000. A matching \$5,000 grant was available for states that appropriated their own funds for child and maternity programs and additional funds were available based on state population. The Sheppard-Towner Act required each state to name a state agency to administer the programs. These agencies in turn had to submit a program proposal to the Children's Bureau for approval. The bureau's power to approve state programs meant that the state agencies addressing child and maternal health did so within the guidelines of the Children's Bureau staff. The

Children's Bureau supported, for example, professional public social service agencies and often rejected state programs run by private agencies.

Programs operating under the Sheppard-Towner Act reached hundreds of thousands of women and children through state agencies that ran child health and prenatal conferences and mothers' classes. At the conferences, the agencies provided prenatal and infant health examinations. In 1924, for example, 303,546 children received examinations. New mothers attending mothers' classes learned the importance of prenatal care. They were introduced to the child-rearing standards of the middle-class professionals in charge of the agencies. Child welfare advocates hoped that these temporary conferences would grow into permanent prenatal and infant care centers, which happened in a number of localities.

Sheppard-Towner agencies also instituted visiting nurse programs. Under these programs, a nurse employed by the agency visited pregnant women and new mothers. The purpose of the visits was to teach the women proper prenatal and infant care. The nurses helped improve the health of mothers and infants. For many women, particularly in rural areas, the nurses' advice was their first introduction to prenatal care. In addition, nurses explained the value of sterilizing all items used during delivery. They also taught the importance of immunizations. Despite all of the benefits of the program, the visiting nurses could, at times, become intrusive in the lives of women. Because they promoted proper child-rearing techniques established by the Children's Bureau, visiting nurses sometimes made new mothers feel inadequate. They counseled new mothers, for example, that children should be raised on strict schedules. They criticized mothers for keeping disorganized homes and told parents that they should not play with their children. There emerged, therefore, a tension between the Sheppard-Towner Act employees and the many mothers who did not subscribe to the Children's Bureau's standardized view of child-rearing.

The Sheppard-Towner Act eventually succumbed to the more conservative environment of the late 1920s. Medical professionals and other federal agencies such as the Public Health Service had worked for years to take over the functions of the maternal and child health care program. They put pressure on Congress to cut Sheppard-Towner money. After receiving a two-year appropriations extension in 1927, the Sheppard-Towner Act was allowed to expire in 1929.

**Shirtwaist Makers Strike** (1909–1910)

One of the major strikes in labor history in the United States, the Shirtwaist Makers strike of 1909–10 brought together various elements of labor conflict in the period—immigrant socialism, militant trade unionism, the role of new workers in mass-production industries, sympathetic community support, and the resistance of employers. The strike began in September 1909 when workers from the Leiserson Shirtwaist Company walked out. A few weeks later, the Triangle Shirtwaist Company locked out its workers, as the employer sought to halt the union organizing drive. During these strikes, women faced violence on the picket line from company thugs. Police also arrested women strikers for streetwalking and inciting violence. Wealthy women, who had come out in support of the strike, also were present, and their accusations of police brutality made headlines. On November 22, at Cooper Union, garment worker Clara Lemlich took the stage to call for a general strike. With her call to action, the massive walkout began. The next morning, more than 30,000 shirtwaist makers were on strike from over 300 shops in the industry. Within a few days, a hundred of the smaller shops settled with the union and reopened their doors, and 10,000 strikers returned to work.

The INTERNATIONAL LADIES' GARMENT WORKERS UNION (ILGWU) Local 25, which had been organizing workers in the trade, assumed leadership of the strike. Supported by the Socialist Party in New York, various community, political, and ethnic associations, and the recently organized NATIONAL WOMEN'S TRADE UNION LEAGUE (NWTUL), a cross-class organization of women, the strike captured the imagination of the public and the support of many of New York's elite. The resistance of large clothing employers, however, remained the most significant obstacle to union success. Major garment firms counted on the police to guard replacement workers and to intimidate and arrest strikers. Even public outrage at the treatment of the "girl strikers" did not break through employer hostility.

By January, most of the small garment shops already had signed agreements with the ILGWU, but the larger factories still refused to bargain with the union. Attempts to negotiate a return to work through AMERICAN FEDERATION OF LABOR (AFL) president Samuel Gompers led only to accusations that the AFL had sold the workers out. Others, notably labor publicist EVA McDONALD VALESH, accused the socialist leadership of running roughshod over the needs of women workers. Her red-baiting comments brought fire from the NWTUL, which saw her as an opportunist. With the progressive failure of the strike, thousands of women garment workers returned to work. The strike officially came to an end in February 1910. It was, however, only the first of a long series of strikes that built the ILGWU and unionized a significant part of the clothing

industry in New York City and other major garment centers. In 1911, the TRIANGLE SHIRTWAIST FIRE, another landmark, called attention to dangerous working conditions in the trade and brought with it the will to completely organize the industry. By 1920, the ILGWU was the third largest union in the AFL, and it remained an influential force in union politics in the 20th century.

**Siberian Expedition**

On August 18, 1918, 9,014 American soldiers, including the 27th and 31st Infantry, then in the Philippines, and selected men from the 8th Division in California, were placed under the command of Major General William S. Graves and sent to Vladivostok to join Japanese and other Allied troops in Siberia. In this Siberian Expedition, they were assigned to intervene in the civil war then taking place in Russia. The object was to secure a government friendly to the war effort by helping to protect Allied troops.

Even as the war in Europe ground onward, fighting continued in northern Russia and Siberia. The RUSSIAN REVOLUTION had begun in February 1917, and Lenin had taken over as premier on January 7, 1918. Afterward, Lenin signed a treaty with Germany and released hundreds of thousands of German, Austrian, Hungarian, and Turkish prisoners of war from Siberian detention. In the same region, many Czechs had deserted and formed a legion of 50,000 to 70,000 men. Their leader claimed the legion as the future Army of Czechoslovakia and offered its services to France and against the Bolsheviks. The Czechs hoped they could fight their way to Archangel in northern Russia, where American troops were also engaged.

On July 23, 1918, a Siberian republic had been declared, but there were competing claims to political leadership. Red Bolsheviks, White anti-Bolsheviks, Russian army soldiers, bandits, warlords, Cossacks, former prisoners-of-war, and men from foreign armies vied for power. The situation merited the words of President WOODROW WILSON that "military intervention would add to the present sad confusion in Russia rather than cure it." Pressured by allies to send men to Siberia, an area more than half the size of the United States, Wilson ordered them to intervene.

General Graves maintained that the only reason for intervention was "to aid the Czecho-Slovakians to consolidate their forces and to steady any efforts at self-government

or self-defense.” He resisted pressure to intervene in the Russian Civil War on the side of the White Army. In January 1920, the Czechs instead fought eastward and defeated a large force of Cossacks. The Americans guarded the line from Lake Baikal to Vladivostok on the Pacific until all the Czechs had evacuated. Americans did, therefore, intervene in the Russian Civil War to help anti-Bolshevik forces. Once the Czechs reached Vladivostok, the survivors boarded ships for Europe, where they became the nucleus of the Czech army. In April 1920, the last Americans withdrew, but the Japanese did not follow until 1925.

American casualties numbered 35 killed and 135 who died of disease. Fifty-two others were wounded, and 50 deserted. The American intervention was a failure. A parallel intervention in Archangel in August 1918, landed 1,200 men from the French Foreign Legion, and some from the British Royal Marines and the U.S. Navy and Marines. They served under a British officer, General Poole. Later, a regiment was added of 4,487 men mainly from Michigan and Wisconsin. Both of these interventions were largely forgotten in subsequent years. America’s intervention, however, set the tone for its relations with the new Soviet Union. The United States refused to recognize the Soviet government until 1933.

**Sinclair, Upton** (1878–1968) *journalist, novelist, activist*

Upton Sinclair was one of the most widely known author-journalists of his generation. In his polemical and political writings, he helped to establish the muckraking style of JOURNALISM and called national attention to the excesses of corporate America. Born in Baltimore, Maryland, in 1878, he was the son of a poor, alcoholic father; but he spent part of his youth in the home of his wealthy grandparents. Sinclair claimed that these widely divergent experiences heightened his awareness of the nation’s social inequality and prompted him to become a socialist. He graduated from City College of New York at the age of 19, by which time he had already established himself as an accomplished journalist.

Sinclair and other progressive journalists were becoming increasingly alarmed at the state of urban America and the virtually unregulated power of corporations. In 1904,

Book cover for Upton Sinclair's *The Jungle* (Library of Congress)

Fred Warren, editor of the socialist journal, *Appeal to Reason*, commissioned Sinclair to investigate the living and working conditions of the largely foreign-born workers in the Chicago meatpacking industry. What Sinclair found, he published in *The Jungle*, a book that shocked the nation. Public outrage prompted President THEODORE ROOSEVELT to order an investigation of the meatpacking industry, which resulted in the passage of the MEAT INSPECTION ACT (1906) and the PURE FOOD AND DRUG ACT (1906). Both the public outrage and the legislative initiatives that followed tended to focus almost exclusively on the lack of, and need for, sanitary preparation of food. The fact that the nation’s supply of hot dogs, sausage, pork, and beef was likely contaminated was a cause of far more concern than the low wages, hazardous working conditions, and substandard living conditions of the Chicago stockyard workers and their families. In later years, Sinclair would lament, “I aimed at the public’s heart and by accident I hit it in the stomach.”

In the decades following the publication of *The Jungle*, Sinclair became heavily involved in politics. After joining the Socialist Party in 1902, he utilized the substantial proceeds from *The Jungle* to establish a utopian socialist community, Helicon Home, in Englewood, New Jersey. Sinclair was an active party member until the party split over American involvement in WORLD WAR I, when Sinclair supported intervention. Sinclair's departure, however, was only temporary. In 1926, he ran unsuccessfully for the governorship of California as the Socialist Party candidate. Not deterred by this defeat, Sinclair launched another bid for the California governorship in 1934. With the state mired in the grip of the Great Depression and unemployment approaching 25 percent, Sinclair ran on a platform of Ending Poverty in California (EPIC). Calling for partial state control of industry and a return to full employment, the EPIC campaign successfully tapped into the widespread resentment and frustration of California voters. The state's business and conservative organizations vehemently opposed Sinclair's campaign, warning that a Sinclair victory would result in the state degenerating into communism. Though Sinclair was defeated, the outcome of the bitterly contested election was surprisingly close, as he received 879,537 votes to his opponent's 1,138,620. Despite his foray into the world of politics, Sinclair continued to write works of political fiction. These included *The Metropolis* (1908), *King Coal* (1917), *Oil!* (1927), and *Boston* (1928). In 1942, Sinclair's *Dragon's Teeth* won the Pulitzer Prize. His final novel, *The Return of Lanny Budd*, was published in 1953. Sinclair died in 1968 at the age of 90.

**Smith, Alfred E.** (1873–1944) *politician, presidential candidate*

Al Smith served four terms as governor of New York, where he was instrumental in running the powerful Tammany Hall political machine between 1900 and 1930. One of the most charismatic politicians of his generation, Smith was the first Irish American and the first Catholic to run for the presidency of the United States. Unlike many other politicians of his day who were born and raised in rural America, Smith was born on New York City's Lower East Side in December 1873. The son of poor Irish immigrants, Smith was forced to drop out of school after the eighth grade to begin working when his father died. During his teenage

years, Smith worked in a variety of jobs before landing a steady one at the Fulton Fish Market. A tall, gregarious man, Smith quickly became well known in New York's close-knit Irish community.

Smith's political career began in 1895 when Tammany Hall appointed him as an investigator for the commissioner of jurors. In 1903, with the support of Tammany Hall, he ran for and was elected to the New York State Assembly. Smith was a popular and effective representative. In 1911 he became the DEMOCRATIC PARTY majority leader and in 1913 speaker of the New York Assembly. During this time, Smith established a reputation as a man of the people and developed close ties with the progressive wing of the Democratic Party. In 1911 he joined future New York senator Robert Wagner and future secretary of labor Frances Perkins in investigating working conditions in New York City factories. The commission found conditions to be deplorable and called for sweeping reform legislation.

Smith's reputation as a reformer vaulted him into the 1918 New York gubernatorial race. He upset the incumbent Republican governor. Smith was defeated in his reelection bid in 1920, but he was reelected in 1922 and remained in office until 1928. As governor, Smith continued to push for reforms aimed at helping poor and working-class New Yorkers. He called for an end to CHILD LABOR and pressed for improved working conditions, child welfare laws, affordable housing, the creation of state parks, and reforms in the treatment of the mentally ill. In addition, Smith spent considerable time attempting to reform and streamline the state's bloated bureaucracy, finally convincing the state assembly to enact a constitutional amendment that reduced the state's 187 agencies to 19. During his tenure as governor, Democrat Smith was frequently faced with a Republican-controlled state assembly and proved very adept at using his immense popularity to push through his legislative agenda. He was often seen walking the streets of New York in his brown derby hat, smoking a cigar, and mingling with local merchants and passersby.

By 1920, Smith had become a powerful force within the Democratic Party. Put forward as a presidential contender, he was the first Irish American and Roman Catholic to receive serious consideration. Smith failed to win the nomination in 1920, but he was brought forward again at the 1924 Democratic convention when long-time friend and political ally Franklin Delano Roosevelt threw his name into the ring. At the 1924 convention, Smith's Catholicism and his public opposition to PROHIBITION were used to deny him the nomination. Finally in 1928, as his popularity and effectiveness as New York governor continued to grow, Smith won the Democratic presidential nomination. In the 1928 general election, Smith faced Republican nominee Herbert Hoover. The 1928 election

was never seriously in doubt, with Hoover winning all but eight states. Although Smith's ties with Tammany Hall, his opposition to Prohibition, and his Catholicism certainly contributed to his defeat, Hoover had other important advantages, including a national reputation as an engineer, a successful tenure as secretary of commerce in the Coolidge administration, and a booming economy, that contributed to his landslide victory.

Although Smith effectively retired from politics following his 1928 defeat, he helped Franklin Roosevelt win the Democratic nomination and the presidency in 1932. Smith's support of the Roosevelt administration, however, was short-lived. Smith, who had entered private business after his retirement from politics, became convinced that the New Deal had gone too far in expanding the role of the federal government. In 1936 and again in 1940, Smith not only opposed Roosevelt's renomination but also publicly endorsed the Republican presidential candidates.

## socialism

Socialism is the name we give to ideas developed in the 19th century about the necessity of sharing the costs and benefits of economic productivity broadly through cooperative means of production or through government redistribution of benefits and social provision. The nature of American society changed dramatically in the last decades of the 19th century. The nation became more urban and industrial as people moved from the farm to the city. City life was vastly different from rural life, and millions of new immigrants meant that the country was more racially and ethnically diverse. The nature of work changed as well. Semiskilled factory workers gradually replaced skilled craft workers. Goods were increasingly mass-produced on assembly lines, and the pace of work increased as employers attempted to streamline production and maximize profits. Finally, the rise of a new financial and industrial elite resulted in growing social and political inequality.

These changes convinced many American citizens to reject the capitalist system and to insist that socialism was the only viable alternative. In its purist form, socialism

rejected private property, the free-market economy, and inequality. It advocated that the means of producing goods and wealth be controlled and shared equally by all members of society. Socialism had roots dating back to the utopian socialism of the 1840s, but scientific socialism began to take hold in the 1870s. The Socialist Labor Party (SLP) was established in 1877 and quickly came under the leadership of Daniel De Leon. It specifically looked toward craft and industrial workers for its support and hoped to achieve control over the labor movement as a means for acquiring political power. A competing faction, the Socialist Democratic Party (SDP), was formed in 1898. More broad-based agrarian socialism found expression in the populist movement. By the turn of the century, socialists were looking to found a new organization.

Led by EUGENE V. DEBS and Victor Berger, the SDP merged with the SLP in 1901 to form the Socialist Party of America (SPA). The SPA grew steadily between 1900 and 1912. From a membership of barely 10,000 in 1901, the party grew to over 150,000 members by 1912. Debs also played a leading role in mobilizing the left wing of the labor movement between 1900 and 1920, helping to form the INDUSTRIAL WORKERS OF THE WORLD (IWW) in 1905. As head of the Socialist Party, Debs ran for the presidency in 1900, 1904, 1908, 1912, and 1920. Although he garnered only 96,000 votes in 1900, the SPA had become the largest third party in the country by 1904, when Debs received over 400,000 votes. He tallied 897,000 votes in 1912. Socialist candidates also gained a small minority of state and local offices across the nation, in a showing of working-class strength.

From the outset, socialist organizations represented an uneasy coalition of supporters, ideas, and objectives. Adherents included radical immigrants, workers, pacifists, Zionists, Christian socialists, revolutionaries, and reformers. They supported a broad range of issues, including prison reform, BIRTH CONTROL, WOMAN SUFFRAGE, and municipal ownership of streetcar companies and public utilities, in addition to more extreme demands to abolish private property and overthrow capitalism. Socialists also created institutions and organizations to support their struggle, including newspapers and journals, socialist summer schools and camps, and communal settlements. Many of these activities had an ethnic cast. In northern cities such as New York and Chicago, immigrant radicals fostered workingmen's circles, newspapers, and drama societies, along with ward clubs. Milwaukee, Wisconsin, became known for its socialist city government. In rural areas where populism once held sway, socialist organizations reemerged. The *Appeal to Reason*, a national socialist newspaper, was edited and published in Kansas; the NON-PARTISAN LEAGUE sprang to life in North Dakota and Minnesota; and the Green Corn Rebellion arose in Oklahoma.

Within the socialist movement, there were long-standing debates about the pace at which American capitalism should be overturned. Some advocated immediate revolution, and others urged more gradual reforms. Still others believed in using socialist means to moderate the effects of industrial capitalism through state regulation of industry and finance, the passage and enforcement of antitrust laws, the institution of democratic reforms of referendum, initiative, and recall, and protective labor measures.

There were numerous ideological variations of early-20th-century American socialism, including communism, anarchism, and syndicalism. All adhered to the basic tenets of socialism, which advocated a fair distribution of public goods and popular control of the economy; but on the best way to achieve those ends, they differed greatly. Anarchists and syndicalists argued that a strong, centralized government was the biggest obstacle to socialism while democratic socialists believed that some form of activist government was essential to ensure progress and a more equitable society. While there was widespread disagreement about the use of direct action and violence for change, some radical socialists and anarchists believed that a revolution was essential and that gradual reform would not work. Ideas about gender equality, sexuality, and marriage also differed greatly among socialists.

The Socialist Party of America was the dominant socialist organization between 1900 and 1930. As a result, the party frequently became the target of repression. When war broke out in Europe in 1914, Debs and the SPA opposed American intervention and warned the public against American involvement. When Congress and President WOODROW WILSON declared war against the Central Powers on April 6, 1917, Debs and the SPA reiterated their opposition to the war. Congress attempted to silence opposition by passing the ESPIONAGE ACT of 1917 and the SEDITION ACT of 1918, which made it illegal to criticize the American government and its involvement in the war. Debs, however, continued to agitate against CONSCRIPTION and the war. Following a June 18, 1918, speech in Canton, Ohio, he was arrested and—after a short trial—sentenced to a 10-year prison term.

After the outbreak of WORLD WAR I, the SPA became more radical, particularly as class relations grew hostile. Debates between militant unionists and conservative craft workers grew more intense as well. By the time of Debs's arrest and imprisonment, a powerful faction in the SPA was advocating revolution, instead of gradual reform. Its anti-war position and increasing radicalism made the party one of the chief targets of the conservative postwar backlash that culminated in the RED SCARE. Led by Attorney General A. MITCHELL PALMER, the government launched a series of raids against suspected socialists. Beginning with American entry into the war and the end of the Red Scare

in 1921, American socialists suffered serious setbacks. The party differed on its attitude toward and support for the RUSSIAN REVOLUTION, and it began to splinter into small new parties intent on capturing the support of the emerging Soviet Union. The COMMUNIST PARTY, a much smaller entity, formed in the early 1920s. The Socialist Party itself remained intact, although it suffered from the absence of its longtime leader Eugene Debs. Although Debs remained in prison, he again was the party's presidential candidate in 1920 and received almost 1 million votes. The election, however, proved to be a last gasp. The conservative backlash of 1919–21 resulted in the election of the Republican WARREN G. HARDING and his successor CALVIN COOLIDGE. Between 1921 and 1930, socialism ceased to be an important factor in American political life. Socialism and its many heirs would again become influential with the onset of the Great Depression.

## social work

The field of social work emerged at the turn of the 20th century as a major new profession in the United States. The first use of the term “social work” was at a National Conference of Charities and Corrections meeting in 1897. From that time on, the term encompassed a broad range of activities, including the traditional work of charities, increasingly known as philanthropy; the care of poor, disabled, and orphaned individuals through private institutions; industrial social work, sometimes called welfare work; hospital or medical social work; settlement house work; and the social services of public relief agencies. During these years, charitable institutions and universities created the new field of social work education, some of which emphasized supervision of clients through the casework method. There were as well growing differences between social workers, which put progressive social reformers at odds with those dedicated to the profession of social work alone.

By 1900, many private charitable organizations, which had been among the first to respond to the urban poor, lacked sufficient resources to address the multiplying social ills of the industrial age. Work accidents, high infant and maternal mortality, family violence, delinquency and

Social worker talking with young girl in her home in New York City, 1913. Photograph by Lewis W. Hine (*Library of Congress*)

crime, and public health crises all seemed on the increase. A new generation of social reformers, many involved in the Settlement House Movement, emerged that combined concern about social disorder with a philosophy of political empowerment. According to JANE ADDAMS, founder of Hull-House, there was a social necessity for settlements, both in addressing the needs of urban immigrants and in providing an almost religious calling for the young. In industry, new calls for efficiency in factories and greater control were often accompanied by programs to provide health care at the workplace, create recreational programs, offer EDUCATION, especially in citizenship skills, and even to supervise workers' home lives. Collectively, WELFARE CAPITALISM demanded more personnel workers and the hiring of industrial social workers to attend to workers' needs.

Even as the need for social workers grew, so too did questions about what held them together as a profession. In 1915 at the National Conference of Social Work meeting, Abraham Flexner, assistant secretary of the General Education Board and the man responsible for reforming

medical education, addressed a gathering of social workers. At that meeting, he raised the question of whether social work was a profession. He frankly told his listeners that it was not. It lacked a common method, approach, or technique that could be taught, and the variety of tasks assigned to social workers made it impossible to define its boundaries. Moreover, the task of distributing relief to the poor was a task almost anyone could do. In response to Flexner's challenge, social work leaders looked toward professional associations to create a collective identity and advertise the value of their work to society as a whole. Casework, in the end, was the collective answer to Flexner's implicit question.

Early professional organization began as social workers started professional clubs in cities across the country. The Monday Club of Boston was the first such organization; it was quickly followed in the 1910s by clubs in New York, Detroit, Minneapolis, San Francisco, and other cities. Meeting to discuss their work and the problems they faced, the clubs were the first step toward national organization and would form the basis for local chapters of a national

organization. In 1921, members of social work organizations from across the country met to form the American Association of Social Workers, which became the National Association of Social Workers in 1955. The organization provided a forum in which to discuss professional standards, present findings of social research and exchange information, encourage professional training, and recruit new members.

More importantly, the move to create social work training and degree programs enhanced the status of social work as a profession. Responding to a call for better training of social workers, the New York Charity Organization Society created first a summer training program for social workers in 1898. Later established as the New York School of Social Work (later affiliated with Columbia University), it became an academic program that combined internships with social study. Soon after, in 1904, Boston Associated Charities, Simmons College, and Harvard University established the Boston School of Social Work. In 1907, Graham Taylor of Chicago Commons Settlement and Julia Lathrop of Hull-House helped found the Chicago School of Civics and Philanthropy (later the University of Chicago School of Social Work). In keeping with its settlement house origins, the school curriculum combined social science research, social policy, and public administration. By 1910, there were five major schools of social work providing some form of graduate training. In 1915 Bryn Mawr developed a post-baccalaureate program, and Ohio State University, Indiana University, and the University of Minnesota established the first undergraduate degrees in social work. The trend toward greater education continued throughout the 1920s.

Central to a number of programs was the new method of casework. As many social workers argued, social work had to become scientific. First articulated in Mary Richmond's 1917 book, *Social Diagnosis*, casework combined the traditional approach of friendly visiting with social scientific method. Occasional notes, intuition, and talk with peers were replaced with systematic case record, theories of scientific philanthropy, casebook studies, and professional guidance through journals, conferences, and consultation with experts. Above all, there was an emphasis on diagnosis and cure of individual ills. By 1918, a new tool became available to social workers, as Freudian psychology became more influential in social work education. In 1918, Smith College established a School of Psychiatric Social Work to train students in working with mental patients. Probing the personality and emotional history of clients promised to aid social workers in performing their duties and to provide relief tailored to individual need. Psychiatric casework also had the possibility of completely severing the profession of social work from its unscientific past. In opposition to this approach stood those social workers who continued to believe that environment, not heredity or individual

pathology, was the key to understanding the poor and to solving their problems. Change the environment, and you change the person. The tension between the two schools of thought continued to dog social work and social policy throughout the 20th century.

Despite debates over how to solve the problems of poverty, the state's expanding role in providing assistance and relief enhanced the reputation of and demand for social workers. Apart from the growth of city relief boards, there was as well a need for social workers in the new juvenile justice system, in schools and through city recreation programs, and in supervising new social programs. The most important relief program created in these years was MOTHERS' PENSIONS. By 1911, the states of Illinois and Missouri began to provide so-called mothers' aid, or "mothers' pensions," to supplement the wages of widowed mothers and to enable them to keep their children in the home. By 1920, 40 states and hundreds of counties had implemented some version of the program. Overall, it was believed that this program protected mothers faced with poverty in retaining their financial independence and improving their family lives. The rule of the program, and the prejudices of its administrators, limited mothers' pensions to white, largely native-born, widowed mothers. The standards for eligibility were strict, and no divorced or deserted wives were thought to have the same claim as widows to state supplemental income. Moreover, when mothers were granted a pension, they agreed to moral supervision and random investigation demanded by the state with any relief allowance. The mothers' pension program thus required states to hire a new corps of workers to supervise the program. While mothers' pensions were never adequately funded, the simple existence of the new bureaucratic agency called for even greater numbers of social work professionals.

The period between 1900 and 1930 saw major new policy initiatives at the state and local levels that increased the need for trained social workers. So, too, did new programs for social work in private industry, public education, and PUBLIC HEALTH. For young men and women committed to a progressive social vision, and those who simply wanted employment that had meaning, the social work profession offered engagement with the public, a moral and even religious mission, and the possibility of helping to change American society. Along with these ideals there was the concrete reality of poverty, chronic disease, the need for education and for hope among the urban immigrant working class and in African-American communities. Taking a role in addressing these problems ennobled some and made others dispirited. Social work became a profession by combining these challenges with the individual desire for prestige and status. By the end of the 1920s, social workers faced the coming crisis of unemployment during the Great Depression with a range of tactics from investigation and

casework to unionization and social protest; but they did so with renewed belief in the ability of their profession to solve the social ills.

### **Soldiers' Bonus (Soldiers' Adjusted Compensation Act) (1924)**

Following the end of WORLD WAR I, there were significant pressures to increase soldiers' compensation, especially given the abysmal pay of soldiers and the institution of military CONSCRIPTION. In response, Congress passed an act to grant soldiers a \$60 bonus on their discharge from the army. When the newly organized and powerful AMERICAN LEGION began to assess the value or damage of wartime service, its leadership suggested a program for further compensation based on the idea of renegotiating "the soldier's contract for service" with the government. The argument was simple. Soldiers had been disadvantaged in not benefiting from the war boom and lost real wages in the bargain. Railroads and industries had received government largess and bonuses during the war. Industrial workers earned high wages for their labor and, according to bonus advocates, now wore "silk shirts." The American public was saved for democracy and incidentally became rich. These forces had their reward. It was only "just due" that a government that scrimped on soldiers' wages, failed to help them adjust to civilian life, and did not guarantee jobs should be forced to ante up.

Veterans' advocates both independently and in the American Legion arrived at a scheme for the government to adjust its payments to veterans to include wages they lost during their wartime service. Based on length of service and time abroad, the proposed Soldiers' Bonus was determined by deducting military pay from the wages that soldiers would have earned as civilians. The government would pay its obligation to veterans as a lump sum payment with interest, due in 1945. Bonus advocates hoped that the long period of time between the Adjusted Compensation Act and the payment of the Bonus would make it more politically palatable. Between 1920 and 1924, however, the plan for additional compensation provoked opposition from across the political spectrum.

Attempts to pass veterans' legislation for the Bonus failed in 1920, 1921, and again in 1922, when President WARREN G. HARDING, not opposed to the bill in principle, still vetoed it as an economy measure. In his veto message, he argued "It is as inevitable as that the years will pass that provision for World War veterans will be made, as it has been made for those who served in previous wars." Financial considerations, however, forced the government to postpone its obligation. "In a personal as well as public manner," Harding said, "I have commended the policy of generous treatment of the nation's defenders, not as a part of any contract, not as the payment of a debt which is owing, but as a mark of the nation's gratitude." In essence Harding chose to voice his own support but let his advisers have their way. As Secretary of the Treasury ANDREW MELLON argued, "the country is staggering under the existing burden of taxation and debt, and is clamoring for gradual relief from war taxation." The last thing that was needed was a new financial burden. Further, military service was an obligation of citizenship and should not be rewarded. In a decade given to the scaling back of government machinery, the Bonus was seen as contrary to the will and interests of the people. Neither Mellon nor Harding mentioned the escalating cost of creating and sustaining the VETERANS BUREAU and its hospitals.

After much debate and amendment, Congress in 1924 passed the Soldiers' Adjusted Compensation Act (nicknamed the Soldiers' Bonus) over a presidential veto. Designed to compensate individual soldiers for income lost during the war, it was funded by 20-year insurance certificates (25 percent increase plus 4 percent annually compounded interest) payable in 1945. Its success was due in large part to the power of organized veterans in the American Legion. The legion, which was modeled on the Civil War veterans' organization, the Grand Army of the Republic (GAR), improved on the basic idea of military pensions. As one American Legion leader wrote, "We extracted more from Congress in one year than the GAR did in its whole existence." The legion excelled in pragmatic politics. Its original plan for the Bonus postponed payment for 20 years; no immediate provision for empowering tax revenues was included in the bill, and there was that common-sense "rational" calculus of lost wages. For these reasons, they were able to overcome objections about the need for a balanced budget. In the years ahead, they and other veterans' groups pushed for the early payment of the Soldiers' Bonus, a drive that sparked the Bonus March of 1932 and the final, early payment of the Bonus during the Great Depression.

### southern demagogues

The word “demagogue” comes from Greek roots that mean leader of the people. In both ancient Greece and contemporary society, “demagogue” came to represent anyone who appealed in visceral terms to the fears and prejudices of the mass of voters. In the United States, it most often has been used to designate agrarian politicians from the South who combined populist appeal, social conservatism, and homespun oratory and who were, for the most part, allied with the DEMOCRATIC PARTY. During the late 19th century, southern demagogues emerged as the product of a distinct rural political culture and ascended to some of the most powerful political offices in the region. The failure of the populist movement to improve the conditions of embattled southern white farmers, the sharp division between town and country within the region, the single-party system that offered no opposition to Democratic Party control of local and state government, and the legacy of racial conflict created the preconditions for the emergence of southern demagogues at the turn of the century. Sometimes stereotyped as rednecks, hillbillies, and yokels, they embraced the traditions of the rural South and white southerners with their earthy language, exaggerated personalities, and homely dress.

Unlike the populist radicals of an earlier day, these agrarian politicians verbally attacked the power of the rich but failed to offer any political solutions to the economic and social woes of the region. Echoing the fears and grievances of the rural poor and middle classes as well as southern workers, demagogues such as Cole Blease of South Carolina and THOMAS WATSON of Georgia played on racial and religious prejudices while they used class rhetoric and the celebration of Christian white supremacy. Even those who sought to better the lives of their constituents found the way to progressive social legislation blocked by conservative state legislatures and the even more conservative judiciary. Competing with other political forces in the South, most notably rivals within the Democratic Party, southern demagogues offered greater political participation for their rural supporters but did not deliver more than symbolic representation.

As governors, congressmen, and senators, southern demagogues played a major role in state and national POLITICS. Among the best known were Pitchfork Ben Tillman of South Carolina, who was elected governor of that state in 1890. He helped to secure legislation that took the right to vote away from African-American men. Elected as senator from South Carolina in 1894, Tillman served in Congress until his death in 1925. In the aftermath of the Spanish-American War, he argued against the U.S. acquisition of the Philippines as a member of the Anti-Imperialist League. He rooted his opposition in his fear of the threat Filipinos presented to White America. While most southern

demagogues echoed Tillman’s racism, some also directed their concerns toward issues of education, taxes, and public improvements. Tillman himself believed that he had his greatest accomplishment in establishing a new agricultural college in South Carolina. Theodore Bilbo, known for his racist rhetoric, helped to improve the roads, lower property taxes for farmers, and increase funding for common schools in Mississippi. Cole Blease had a following among white textile workers in the Piedmont region. Others claimed to speak for white farmers and laborers. Other politicians from the South similarly identified as demagogues—men such as Jeff Davis of Arkansas, James K. Vardaman of Mississippi, and Fiddlin’ Bob Taylor of Tennessee—carried the banner of white supremacy in their domestic and foreign politics.

The most famous southern demagogue of the 20th century, and the one whose popularity transcended the region, was Louisiana’s Huey “Kingfish” Long. Growing up, he had heard a speech by Wild Jeff Davis of Arkansas, and he was strongly influenced by demagogues of the South. While he became the most conspicuous heir to its political legacy, Long also expressed its most radical side. His call to “Soak the Rich” and his attempt to broaden the number of his constituents who benefited from government largesse in new educational and social programs expanded his popularity beyond its rural base. Later southern politicians such as Eugene Talmadge of Georgia and George Wallace of Alabama carried the traditions of southern demagoguery into the 1960s with their staunch opposition to school integration and civil rights legislation.

### sports

Prior to 1900, Americans participated in a variety of sporting activities, but few sports drew a large number of spectators. As men and women of all classes had more leisure time, spectator sports increased in popularity. The most popular sports of the time were BASEBALL, boxing, and football. All three sports, along with basketball and hockey, began to evolve into their current form of professional organization. At the same time, there were tensions between team owners and their employees. Professional athletes sought to exert greater control over their by forming player associations and unions. Their efforts, however, were largely unsuccessful. By 1930, owners had more power and control than they had in 1900.

The sport of football emerged in the decades following the end of the Civil War. Played initially on college campuses, the modern game developed slowly as teams altered the rules of rugby and soccer into a hybrid game that featured more scoring and physical contact. The early game of football was extremely violent. In 1909, for example, there were 33 recorded football fatalities, prompting many college presidents to question their support of the game. Despite its hazards, football had become synonymous with collegiate athletics, masculinity, and school pride by the 1920s, as it retained and even expanded its popularity.

Between 1900 and 1920, when the first professional football league emerged, there were many rule changes. None revolutionized the game more than the introduction of the forward pass. Passing greatly increased the game's popularity, and attendance skyrocketed over the next several decades. Many of the best early professional teams were located in the Midwest, with Ohio's Canton Bulldogs and Massillon Tigers among the elite. Professional football players, however, rarely received wages sufficient enough to allow them to rely on the game as their only source of income. The result was that most professional squads devoted little time to practice, and they experienced frequent personnel changes, which prevented them from developing the cohesiveness of collegiate squads. Until the emergence of the American Professional Football Association in 1920 (renamed the National Football League in 1922), the collegiate game remained far more popular and competitive. With the league's formation, interest in professional football grew steadily; attendance at NFL games increased, and by 1934 it totaled 492,000.

The popularity of professional boxing also grew tremendously between 1900 and 1930 as some of the sport's most memorable figures captured the nation's attention. JACK JOHNSON was one of the most talented boxers of the time. He won the heavyweight title in 1908 when he defeated Canadian Tommy Burns, in Sydney, Australia. As the nation's first African-American heavyweight champion, Johnson was treated as a hero in the black community. Many white boxing fans, promoters, and reporters, however, were desperate for a "Great White Hope," the white boxer who would "put Johnson back in his place." In 1910 former heavyweight champion Jim Jeffries came out of retirement for a July 4 fight for a record prize of \$100,000. Johnson, at the peak of his career, put on a brilliant boxing display and knocked Jeffries out in the 15th round. News of Johnson's victory was greeted with enthusiastic celebrations in African-American communities. Johnson eventually lost the heavyweight title to Jess Willard in a controversial bout in Havana, Cuba, in 1915.

Boxing finally found its great white champion in WILLIAM HARRISON "JACK" DEMPSEY, who won the heavyweight title in 1919. Although others have had a longer

Jim Thorpe kicks the football during a game in October 1912. (*Cumberland County Historical Society*)

reign as heavyweight champion, Dempsey's impact on the sport is hard to exaggerate. His boxing exploits were captured on film and shown to audiences across the country, giving Dempsey the kind of exposure no other fighter had ever enjoyed. Part of his popularity undoubtedly stemmed from the fact that by 1919, when he won the heavyweight title, many boxing fans were still searching for a great white champion. Jess Willard's victory over Jack Johnson in 1915 remained controversial. When the untainted, handsome, rugged, and gregarious Dempsey arrived on the scene, he was, for many white boxing fans, the right kind of champion. He held the heavyweight boxing title until 1926 when challenger Gene Tunney defeated him. The following year in a rematch, Tunney was again defeating the challenger on points when Dempsey knocked him to the canvas. After a "long count," during which Tunney had enough time to recover, he rejoined the match. He went on to win the controversial bout on points.

The spectator sport that grew most dramatically between 1900 and 1930 was professional baseball. Baseball

had been played in the United States since before the Civil War. Professional leagues dated back to the formation of the National Association of Professional Base Ball Players in 1871. At that time, the sport was often in a state of chaos. Teams formed and then moved or disbanded. Players jumped from team to team in search of higher pay, often playing for numerous teams within a single year. The sport also lacked a uniform set of rules, which prevented players, managers, and gamblers from determining the outcome of games. By the 1890s, the sport had developed a sense of cohesiveness as owners of teams in the newly formed National League began to drive out competitors and secure the services of the game's best players.

A challenge to the dominance of the National League came in 1899 when the Western League renamed itself the American League. League president Ban Johnson recruited several prominent National League owners and managers who were dissatisfied with its management. The American League began to lure high-profile players away from the National League. In 1902, the two leagues worked out an agreement that allowed both leagues to coexist and flourish. It created a National Baseball Commission consisting of the two league presidents and a neutral third party. The agreement also established rules regarding the transfer of players from one team to another and the movement of players from the minor leagues to the major leagues. Several dominant teams emerged in the period, including the New York Giants, the Chicago Cubs, the Detroit Tigers, the Boston Red Sox, and the Philadelphia Athletics. In 1903, pennant winners from each league competed in the first World Series, which the American League champion, Boston, won. The game grew tremendously in popularity, surpassing all other professional sports.

Baseball, however, continued to be plagued by scandal and corruption. Gambling and the fixing of games had been a problem in baseball and other sports, and the payoffs could be lucrative. The lure of money for fixing games was made more tempting when the 1902 agreement prevented American and National League teams from raiding players. The result was that owners had complete control over the rights of the players. The no-raiding rule prevented them from jumping to a team willing to pay more for their services. While baseball players were paid handsomely compared to the wages of many fans, they complained that owners received revenues far in excess of what they paid in salaries.

The problem of gambling came to a head in 1919 with the "Black Sox" scandal, which almost ruined the sport. That year, eight players on the American League champion Chicago White Sox accepted money from gamblers to intentionally lose the World Series to the underdog Cincinnati Reds. Each of the eight players reportedly agreed to accept \$10,000 to play poorly. When the plot was uncov-

ered, evidence of similar scams came to light; and the public began to question the integrity of the game. Realizing that the future of the game was on the line, owners moved quickly to regain public confidence. An agreement was reached in 1920 to create an independent baseball commissioner. Judge Kenesaw Mountain Landis agreed to become the sport's first commissioner. He insisted on almost dictatorial control over the game, and in 1921 he banned all eight White Sox players (whom he had acquitted for lack of evidence) from the game for life. The decision helped reestablish public confidence in the sport, but it was the emergence of the legendary Babe Ruth that put the sport back on solid footing.

Between 1920 and his retirement in 1934, Ruth dominated the sport like no player has before or since. He had been one of the game's best pitchers and hitters for the Boston Red Sox since he entered the league in 1914. In 1920, the Red Sox's financially strapped owner sold Ruth's contract to the New York Yankees for \$125,000. His arrival in the New York market brought his game to a new level and catapulted him into national celebrity. Ruth excelled at every aspect of the game, but it was his tremendous home run power and off-the-field exploits that made him the country's most popular sports hero. Prior to 1920 home runs in baseball were extremely rare, with league-leaders rarely approaching double figures. In 1920, Ruth belted an amazing 54 home runs and topped that with 60 in 1927.

Other professional and amateur spectator sports either emerged or grew in popularity between 1900 and 1930. These included basketball, hockey, and golf. Invented by James Naismith in the 1880s, basketball mirrored the path of development taken by football. The amateur game emerged as a staple of college athletics and increased in popularity. The first college games were played in the 1890s, and a college rules committee was created in 1905. By 1920, most colleges and universities had established teams. At the professional level, basketball grew slowly. The National Basketball League was created in 1898. Prior to WORLD WAR I, the best professional team was the original Celtics. Support for the professional game, however, remained minimal; and few teams developed a loyal fan base until the formation of the National Basketball Association in 1949.

Professional and collegiate ice hockey also grew in popularity between 1900 and 1930. Developed in the 1860s, the game first took root in Canadian colleges and universities but quickly spread to the professional level in both Canada and the United States. The Stanley Cup was first awarded to the best Canadian team beginning in 1894. The trophy began to be awarded to the best professional team with the formation of the National Hockey League (NHL) in 1917. The NHL reformed in 1925 with professional teams in Toronto, Detroit, Montreal, Chicago, Boston, and

New York. Between 1900 and 1930, the sport had a sizable following in Canada, the upper Midwest, and on the East Coast, but it had not yet developed a large national audience.

Racial and gender discrimination were common features of American society between 1900 and 1930, and professional and collegiate sports were no exception. Universities, team owners, and promoters had almost complete control over who was allowed to participate. Most spectator sports excluded the participation of women and African Americans. At the turn of the century, some players of color, if their skin was light enough, were allowed to compete professionally. Native American Jim Thorpe, for example, was allowed to play collegiate and professional football. As SEGREGATION intensified, most sports rigidly enforced the color bar. Excluded from white male professional sports, women, African Americans, and other people of color formed their own teams and leagues. African-American baseball teams toured the country as far back as the 1880s. These barnstorming teams formed the Negro National League in 1920 and the Negro Eastern League in 1921. The Negro Leagues boasted some of the game's greatest players, including Josh Gibson, Cool Papa Bell, and the legendary Satchel Paige. Though not widely supported, women competed on basketball teams as early as 1895, but the women's game did not develop a wide audience. Most women athletes remained confined to amateur sports teams in college, at work, or in the community.

Spectator sports had a profound impact on the development of modern American culture. They emphasized physical prowess, competitiveness, and passive consumerism over all other attributes. The public and the media hailed athletes as heroes. Even in the period between 1900 and 1930, professional athletes earned incomes well in excess of those enjoyed by ordinary Americans. In 1927, Babe Ruth demanded and received a salary of \$100,000. Fans of spectator sports also were encouraged to be passive consumers. Prior to 1900, most local communities had semiprofessional and amateur baseball and football squads. As spectator sports increased in popularity, adult participation in these sports dwindled. Attendance at virtually every professional sport increased dramatically between 1900 and 1930. Similar rates of growth occurred in collegiate spectator sports. Finally, because of the increase in the number of spectators, sports became a medium through which owners and advertisers could, by identifying a team or an individual player with a product, sell consumer goods. Product endorsement, while it would become much more prevalent in the decades following the end of World War II, began to emerge in the 1920s and helped transform professional sports into a multimillion dollar industry that exerts its influence on virtually every aspect of American life.

## Standard Oil

The Standard Oil Corporation was among the largest, most influential companies in the Progressive Era. By 1900, it had established a near monopoly in the American oil production industry. JOHN D. ROCKEFELLER, a self-made entrepreneur, was the driving force behind the company. Despite having little formal education, Rockefeller built one of the most profitable corporations in American history and helped revolutionize the nature of business. Shortly after oil was discovered in Titusville, Pennsylvania, in 1859, the Cleveland, Ohio, area became one of the centers of the oil refining industry. Within a short period of time there were dozens of competing refineries located in and around the city. In 1863, Rockefeller and his partner Maurice Clark joined the fray and established an oil refining business near Cleveland. Initially the industry was extremely chaotic. Dozens of different companies focused on isolated aspects of the production process, and all attempted to undercut the profitability of their competitors. In addition, because each aspect of production was independent, there was great inefficiency. Using the profits he made to expand his company, Rockefeller began squeezing out or buying up competing refineries.

In 1867, Rockefeller, along with his brother William Rockefeller, Samuel Andrews, Henry M. Flagler, and S. V. Harkness, pooled their resources to create the Standard Oil Corporation with a capital outlay of \$1 million. By 1872, Standard Oil controlled 10 percent of the oil refining industry. Rockefeller was determined to control every aspect of the industry, including drilling, refining, transportation, sales, and distribution. He ruthlessly exploited the size of Standard Oil to force concessions and lower rates from the railroads. Once these lower rates were secured, Rockefeller was able to undercut other competitors and soon dominated the Cleveland market. By 1882, Standard Oil controlled over 90 percent of the oil refining industry. Throughout the rest of the century, Rockefeller expanded his oil empire to include ownership of oil wells, railroads, refineries, and distribution facilities throughout the country. He could set oil prices at whatever level he desired. Popular resentment about the power of new national corporations such as Standard Oil led to passage of the Sherman Antitrust Act of 1890. The legislation was intended to

Political cartoon depicting a Standard Oil tank as an octopus with its tentacles wrapped around the steel, copper, and shipping industries as well as a state house and the U.S. Capitol while one tentacle reaches for the White House (Library of Congress)

prevent companies from monopolizing an entire industry. In actual practice, however, the Sherman Act was invoked only infrequently and then typically directed against organized labor.

In the first decade of the 20th century, popular resentment against monopolies and trusts intensified. Muckraking journalists exposed political and corporate corruption, further fueling demands that the federal government intervene and break the power of the monopolies. In 1902, *McClure's Magazine* began publishing a series of 18 articles exposing the way in which Rockefeller built and maintained his oil empire. Written by journalist IDA M. TARBELL, *The History of Standard Oil* (1904) galvanized public and political opposition against the company and helped convince the federal government to look into possible antitrust violations. President THEODORE ROOSEVELT had promised to enforce the antitrust legislation and take an aggressive stand against illegal trusts and monopolies. In 1906, Roosevelt, claiming Standard Oil was 20 times larger than its nearest competitor, instructed the federal government to take action. The case wasn't resolved until 1911 when the Supreme Court ruled that the company had in fact violated federal antitrust laws and ordered that the company be broken into smaller, independent parts.

For a period of time, the Supreme Court's decision to break up Standard Oil had the desired impact. Even before the court ruling, it had become clear that Standard Oil's domination of the industry had begun to wane. Several new competitors entered the field before 1911, including Texaco (1902), Shell (1907), and British Petroleum (1909). By the time it was dissolved, Standard Oil controlled only 65 percent of the industry. The Supreme Court ruling against Standard Oil broke the giant into 34 smaller companies.

Eventually, however, several large corporations dominated the industry. Known as the Seven Sisters, Esso, Shell, Amoco, Chevron, Atlantic Richfield, British Petroleum, and Texaco extended their control over all aspects of the industry, both in the United States and around the world.

## steel industry

By 1900, the United States had become the world's dominant steel producer. Record demand for its products in the construction of skyscrapers, ships, and railroads had made the industry the engine of the nation's ECONOMY as well. The steel industry had prospered by the dynamic growth of city construction in the 1890s. It also had drawn strength from such changes as improved and expanding urban transport systems, the rebuilding of railroads with new, heavier steel rails, and the introduction of nickel-plated steel armor on battleships during the naval rearmament efforts at the turn of the century. In each of these arenas, new technologies and methods of organization had driven out small firms and increased the demand for capital to expand and improve steel production.

The fortunes that were made in steel did not, however, guarantee the industry's profitability. Fueled by Andrew Carnegie's cutthroat methods, competition among steel firms had made the steel industry and subsidiary concerns in railroad transportation and iron, coke, and coal mining prone to sharp drops in profit, periodic recession, and market chaos. Major industrial and finance capitalists such as JOHN D. ROCKEFELLER and John Pierpont Morgan had invested in the field as a means of stabilizing their own enterprises. In the late 1890s, however, Carnegie once again threatened to undercut competitors when he moved from producing raw steel to constructing a finishing plant to make steel tubes and girders and building his own rail link from the plant to Pittsburgh. These moves directly threatened both Federal Steel, a competitor directed by Elbert Gary and financed by Morgan, and the Pennsylvania Railroad. Contacting Carnegie's superintendent, Charles Schwab, Morgan proposed a gigantic merger of Carnegie Steel with Federal Steel and a host of subsidiaries, including American Bridge and National Tube. Founded in February 1901 at the end of a decade-long merger movement in the industry, U.S. STEEL was the brainchild of Schwab and Morgan.

U.S. Steel became the nation's largest corporation with over \$1.4 billion in assets and control of 65 percent of the

market in steel production. It employed over 168,000 workers at the time (the number would grow to over 350,000 by 1920). Its holdings included 41 iron mines, 213 steel mills, 78 blast furnaces, 1,100 miles of rail, and 112 Great Lakes iron ore boats. The industrial empire continued to acquire new properties throughout the first three decades of the 20th century. While U.S. Steel lost some market share due to the growth of the market and new competition, especially in sheet steel, it dominated the steel industry, controlled large parts of the subsidiary economy, and had substantial influence on government at all levels.

The consolidation of steel manufacture under U.S. Steel had, however, detrimental effects on innovation in the industry. Up to 1900, Carnegie Steel had been a leader in improving the quality of open-hearth steel beams for construction. Now under the U.S. Steel Corporation name, Carnegie Steel lost its place as an industry leader. Since stability was the key goal of the U.S. Steel merger, there was little incentive for innovation. Technological change came, instead, from smaller and more marginal firms, most of which were outside the U.S. Steel combine. Midvale Steel, a subsidiary firm, was the location of FREDERICK WINSLOW TAYLOR's experiments in cutting metal and his reorganization of the labor force and production later known as SCIENTIFIC MANAGEMENT. Bethlehem Steel, a smaller firm that earlier competed with Carnegie Steel in steel beam construction and the production of armor plating, constantly worked on improving its product and became a premier government contracting firm. It reinvested its profits from WORLD WAR I defense production and became the second largest steel producer in the United States by the 1920s. Finally, in the areas of high-speed steel for machine tools and alloy, sheet and electric steel, it was the smaller start-up companies that made a difference. Automobile manufacturers, the largest consumer of domestic steel in the 1920s, experimented with producing their own steel and created the alloy steels for new models. Alloying steel with nickel, chromium, vanadium, manganese, and molybdenum made it both stronger and more flexible for molding into bumpers, fenders, and other automobile parts. Continuous sheet steel, another innovation of the period, helped to guarantee automobile makers the supply of steel they needed for body parts.

Since the cataclysmic Homestead strike of 1892, the steel industry steadily decreased its dependence on union labor and worked to drive labor union organization out of steel plants. The Amalgamated Association of Iron and Steel Workers, which originally had contracts with several major firms, was locked out of steel manufacturing plants and steadily declined in numbers and influence in the late 19th and early 20th centuries. The changing division of labor in steel factories de-skilled steel production and replaced skilled iron puddlers and boilers with semiskilled

production workers and a resulting decline in wages. This shift affected the ethnic makeup of the labor force, and the average steel worker of the early 20th century was an eastern or southern European immigrant workingman, with little formal schooling and few resources. He usually had limited English and had little recourse to employer demands. In the workplace, corporate leaders insisted that steel production in blast, Bessemer, or open-hearth furnaces required 24-hour production. While hours varied by occupation, more than 60 percent of the steel labor force worked between 60 and 84 hours per week. That often meant two standard 12-hour shifts with a long turn (24-hour shift) every two weeks. Dangerous heat and heavy machinery, unstable production methods (explosions were a common occurrence), and fatigued workers led to a shockingly high rate of industrial accidents in the steel industry.

Wage cuts in the wake of industry downturns led to labor disturbances in 1907, 1909, and 1919. U.S. Steel and its competitors such as Bethlehem and Republic Steel had no intention of recognizing and bargaining with unions. With the decline of the Amalgamated union, labor conflicts in the steel industry were, for the most part, not a welcome occurrence for the weakened union. Workers protested informally and struck collectively, largely without union support. Organized under the AMERICAN FEDERATION OF LABOR, however, the STEEL STRIKE OF 1919 brought union resources to the industry. The largest segment of striking workers was, in fact, new to unionism. William Z. Foster, a radical trade unionist, and John Fitzpatrick, a Chicago trade unionist, led the drive to organize the mass-production steel industry. They had organized more than 100,000 when they began to ask for government mediation in the industry. When U.S. Steel president Elbert Gary refused to negotiate, more than 365,000 workers went out on strike in protest of the post-World War I wage cuts. Between September 1919 and January 1920, the strike held the attention of the industry and nation. U.S. Steel called on the Pennsylvania State Constabulary to repress unionism in the Pittsburgh area, and their Gary, Indiana, plants drew on local police to break up picket lines and protect replacement workers. The strike was broken, and industrial unionism in steel became moribund.

The immediate postwar crisis of unemployment had little long-term impact on the steel industry, which recovered strongly under the economic boom of the 1920s. It used the profits of wartime production to retain its dominance in the world steel market, including growing exports to Japan. At the same time, riding on the coattails of an expanding domestic automobile market, profits in steel hit record levels. U.S. Steel kept growing, even as it began to slowly trim its labor force. The automobile industry was a force for steel industry expansion, as steel continued to expand its production facilities in the Great Lakes region,

especially around Detroit, and in the South. Despite its positive growth, a looming economic crisis threatened to undermine the stability and prosperity of the steel industry. Overextended credit and over-expanded production facilities allowed little room for the drop in demand in the late 1920s. Overstocked automobile manufacturers and growing unemployment suggested that the boom times of the steel industry, begun in the 1890s, were about to come to an end.

Misa, *A Nation of Steel: The Making of Modern America, 1865–1925* (Baltimore: Johns Hopkins University Press, 1995); William Serin, *Homestead: The Glory and Tragedy of an American Steel Town* (New York: Random House, 1992).

### Steel Strike of 1919 (1919)

The Steel Strike of 1919 was the largest of a wave of strikes that shook the country following the end of WORLD WAR I. The strike, which began on September 22, 1919, and lasted until January 8, 1920, involved 365,000 steelworkers and marked the end of the wartime labor accord. Prior to the war, the STEEL INDUSTRY was largely unorganized. Steel companies vigorously opposed unionization. They sought to keep workers divided and unionization at bay by perpetuating ethnic and racial tensions in the workplace. The strategy was very effective. During the war, however, the administration of President WOODROW WILSON wanted to prevent production delays by avoiding labor disputes. When the administration created the War Labor Board to arbitrate labor conflicts, progressives in the labor movement, including WILLIAM ZEBULON FOSTER, took advantage of the opening to launch a drive to organize steelworkers.

Despite efforts to organize workers, conditions in the steel industry remained harsh. Steelworkers put in an average of 68.7 hours a week, considerably more than workers in other industries. In addition, wages were low and working conditions hazardous. In 1918, Foster convinced Samuel Gompers and the AMERICAN FEDERATION OF LABOR (AFL) to launch an organizing drive among steel and ironworkers. They created the National Committee for Organizing Iron and Steel Workers, which targeted industry giant U.S. STEEL in its Gary, Indiana, and Pittsburgh, Pennsylvania, plants. The company had a long history of antiunionism and vowed to resist the organizing effort at all costs. Despite opposition from local officials and U.S. Steel's threat to use replacement workers to break the union, the organizing committee succeeded in unionizing 100,000 steelworkers by June 1919. The effort succeeded

because organizers aggressively recruited foreign-born unskilled laborers, to whom they portrayed the union as patriotic and an integral part of the fight against Kaiser Wilhelm and Germany. U.S. Steel responded by reiterating its commitment to maintaining a nonunion workplace. The company fired suspected union organizers and union leaders. Its efforts backfired and greatly increased rank-and-file support for the union.

In May 1919, the National Committee demanded a significant wage increase, an eight-hour workday, the abolition of company unions, the rehiring of workers fired for union activities, and union recognition. U.S. Steel refused to negotiate with union representatives. By August 1919, the crux of the conflict centered on union recognition. Gompers believed that Wilson and the NATIONAL WAR LABOR BOARD would pressure U.S. Steel president Elbert H. Gary to keep the peace. Gary, however, informed the War Labor Board that he was unwilling to even meet with the union. When Wilson refused to pressure the company, militants criticized Gompers's faith in the War Labor Board and began preparing for a strike. Led by William Z. Foster and Chicago trade unionist John Fitzpatrick, the National Committee prepared for an all-out strike; but Gompers, worried about the reliability of unskilled, foreign-born steel workers, agreed to a request by President Wilson to postpone any labor action.

Foster and Fitzpatrick were outraged and pushed ahead with plans to launch an industry-wide strike on September 22, 1919. Response to the strike call was massive. An estimated 275,000 steelworkers walked off the job the first day and their number peaked at 365,000 the next week. U.S. Steel, the media, local officials, and the federal government responded swiftly and forcefully. Striking

State troopers armed and ready to quell rioters during the Steel Strike of 1919 in Farrell, Pennsylvania (Library of Congress)

workers were threatened, intimidated, fired, and beaten. By the end of the walkout, 22 strikers had been killed. Many local newspapers reported that foreign-born radicals bent on undermining American society were leading the strike. Wilson and the War Labor Board stood by as local business and political leaders called on the police and militias to disperse striking workers and escort replacement workers safely inside plants. When Gompers and the AFL leadership refused to commit more support, the strike collapsed. It began to lose support among workers by December, and the National Committee officially called off the strike on January 8, 1920.

Critics of Gompers, at the time of the strike and since, maintain that massive support of the strike indicated that it could have been successful if the AFL had fully supported the action. The AFL's distrust of foreign-born unskilled workers and its preference for craft unionism ensured that the strike failed. More importantly, the AFL's reluctance to organize mass-production industries on an industrial rather than craft basis meant that the labor movement failed to capitalize on the nascent militancy and radicalism of unskilled industrial workers and ensured that the labor movement remained small and weak until the Great Depression.

**Steffens, Lincoln** (1866–1936) *reformer, journalist*

Born in San Francisco, California, in 1866, Lincoln Steffens was among a handful of turn-of-the-century writers and journalists collectively known as MUCKRAKERS. The son of a wealthy businessman, Steffens attended the University of California, where he became actively involved in radical politics and began writing about the rampant corruption and excess in both private and public life.

Steffens began his career in journalism in 1892 and had modest success. It was as editor of *McClure's Magazine* that Steffens established himself as one of the most influential journalists in the country. He edited *McClure's* between 1902 and 1906. Determined to make *McClure's* a financial and political success, Steffens hired a staff of progressive writers that included UPTON SINCLAIR, IDA TARBELL, and Ray Standard Baker. As editor, Steffens transformed *McClure's* into the leading political magazine in the country. Articles by Upton Sinclair exposed unsafe and unsanitary conditions in the Chicago stockyards. Ida Tarbell chronicled the unsavory way in which STANDARD OIL became one of the largest and most powerful corporations in the country. In *Shame of the Cities*, Steffens

himself railed against the power of corporations and the new business elite, who, he argued, were lining their pockets, undermining democracy, and corrupting the nation's political, legal, and economic systems at the expense of the common people. Although President THEODORE ROOSEVELT and others chaffed at the manner in which Steffens exposed corporate greed and corruption, they understood the depth of popular resentment and initiated legislative reforms. These reforms included the MEAT INSPECTION ACT (1906), the PURE FOOD AND DRUG ACT (1906), and the HEPBURN ACT (1906).

Under Steffens's leadership, sales of *McClure's* expanded, as did its influence among progressives, socialists, and political reformers. In 1906 Steffens decided to leave the magazine to form a new, more radical journal, *American Magazine*, along with Tarbell and Baker. Despite an impressive roster of writers, *American Magazine* never achieved the critical or financial success of *McClure's*. Throughout the Progressive Era, Steffens's politics continued to evolve along more radical lines, culminating with his self-exile in the Soviet Union between 1919 and 1921. Steffens's support of the Soviet experiment was ultimately short-lived. By the time he published his autobiography in 1931, he had become thoroughly disenchanted with the Soviet government.

**suburbs**

American suburbs took shape during the period from 1900 to 1930. Four characteristics have made suburbs in the United States unique compared to suburbs in other countries. The first distinguishing characteristic is a low population density, a settlement pattern that Americans sought in an effort to make their lives private. The second characteristic is the desire for homeownership; a greater percentage of Americans own their own homes than in any other country. The third defining characteristic is the socioeconomic distinction between the core city and the suburbs. Those living in the suburbs tend to be wealthier and better educated than residents living in core cities. The

final characteristic is the length of the journey to work. As suburbs grew, Americans accepted ever-longer commutes to and from work. These four characteristics set America apart from the rest of the world. To understand why America's suburbs have developed in this manner, one needs to look at the confluence of developments that created suburbs in the early 20th century.

The 20th-century suburb evolved through three stages determined by the dominant mode of transportation. During the late 19th century, the railroad served as the only way to reach the outer limits of a city and thus determined the settlement patterns of the suburbs. Early in the century, the electric streetcar revolutionized URBAN TRANSPORTATION and made it possible for a greater number of city residents to live outside the city center. Automobiles provided the next great change in suburbanization. Cars and the expansion of roads led to an explosion in suburban populations as the outer rings of metropolitan areas became more accessible. Transportation changes were not the only determinants of suburbanization, however. Cheaper construction methods, the availability of home mortgages, cultural changes, and public funding of transportation improvements also contributed to America's flight to the suburbs.

Suburbs arose out of people's desire to escape the city. At the turn of the century, escape was possible only for a few wealthy businessmen and their families. Due to the cost of rail transportation, which was prohibitive for most middle-class and working-class people, the rail suburbs consisted of the homes of wealthy businessmen—and workers who provided services such as gardening and domestic labor. The development of the electric streetcar profoundly affected labor. Fares were much lower on the streetcars than on the regular railroads, which made it possible for middle-class people to live in suburbs. The streetcar lines also reached more areas than the railroad, opening up new lands for housing development. In fact, urban transport companies used the streetcar lines to attract purchasers for land near to their lines.

Streetcar suburbs grew in a spoke-and-wheel pattern, with the city at the center of streetcar lines radiating out into the suburbs. This pattern of suburbanization was aided by public-funded city services. In the 1900s street-paving and other utilities such as sewers were paid for by a special assessment on those property owners living on the street being improved. In the early 20th century, influenced by the lobbying of property developers, city governments decided that paving streets would bolster commerce. Cities therefore began to tax all city residents for civic improvements. In effect, it taxed all residents for the benefit of those moving to the city's edge.

Many other developments aided the creation of American suburbs during this period. As the streetcar companies extended their lines, cheaper property became available

outside cities, which made the very cheapest housing opportunities available farther outside the cities. The development of the balloon-frame house also made single-family dwellings affordable. Before the development of balloon-framing, heavy masonry columns and walls supported the weight of a house. This method of building was too expensive to use for large numbers of houses. Balloon-framing, in which a frame constructed of two-by-four boards supports the weight of the house, was much cheaper and made it economically possible for a wider section of American society to own a single-family home. Another development that aided suburban growth was the willingness of farmers to sell their land to property developers because agricultural prices had declined. It made economic sense for them to sell their land instead of continuing to farm.

New methods of financing home ownership also helped spread America's suburbs. Building and loan associations emerged during the early 20th century. Members of these associations bought shares and in return the association granted loans for its members to buy homes. By spreading the cost of a home over a number of years, building and loan associations made houses affordable for many Americans who could not afford to buy a house outright. Finally, Americans underwent a cultural change that raised the value of privacy. Suburbs appealed to those seeking to escape the crowded environment of the city. A home of one's own, set in the middle of a large yard, possibly with a hedge to screen the view from the road, provided the privacy that many sought.

The next step in the evolution of suburbs came with the rising popularity of the automobile in the 1920s. In 1905 there were 8,000 automobiles registered in the United States. By 1925 there were 17,481,001 autos registered. This tremendous increase in the number of Americans driving cars changed the suburbs. The turn to cars as the preferred mode of transportation encouraged the expansion of roads. The federal government aided local governments in expanding the road system. The 1916 Federal Aid Road Act offered matching funds to city governments that organized highway departments, and the 1921 Federal Road Act offered funds for the construction of roads. In an effort to relieve traffic congestion for commuters, state and municipal governments used these funds to pave and expand traffic arteries out of the cities and later to build "parkways." These roads limited access in an effort to maintain constant traffic speeds and, as their name implies, were meant to provide a parklike environment for the drivers, with natural settings constructed along the roadway. America's embrace of the automobile was accompanied by the decline of streetcar systems. By the 1920s streetcar systems had become unprofitable for a variety of reasons, a development that made automobile travel the preferred method of transportation.

Cars also reshaped suburban settlement patterns. By necessity, streetcar suburbs were concentrated within walking distance of streetcar lines. Automobile transportation and the expansion of roads made it possible for suburbs to grow anywhere. Thus, suburban settlement began to fill in the spaces between streetcar lines, altering the spoke-and-wheel settlement pattern. Because land was cheaper in the areas between streetcar lines, the inhabitants could afford larger pieces of property, which gave rise to the uniquely American pattern of a single-family home sitting in the middle of a large yard. It further deepened the disparity in population density between the cities and suburbs.

Trucks also played an important role in America's suburbanization by making industrial suburbs possible. During the era of rail transportation, manufacturers concentrated within the central area of the city, close to rail lines, because the only way to transport large amounts of goods was by rail. The expansion of the road systems made it possible to use trucks to transport goods. Businesses jumped at the opportunity afforded by the truck, because land was cheaper in the suburbs than in the city. As industry moved out of the city, workers followed, which helped the dispersal of population to the suburbs.

By 1930, America's suburbs had evolved into the pattern familiar today. It is important to remember that suburbanization occurred through the actions of many different interests. It was not accidental. Developers, automobile companies, street car companies, reformers, individual citizens, and government officials all acted to create the American suburb.

**Sullivan, Louis H.** See VOLUME VI.

### **Sunday, William Ashley, Jr. (Billy Sunday)**

(1862–1935) *evangelist*

Billy Sunday was one of the foremost evangelical ministers of his era. Like many clergymen of the time, his sermons were built upon a combination of devotion to Christ and dedication to hard work and social responsibility. His ability to overcome adversity led him to believe, and then preach, that moral fortitude was the principle prerequisite for success.

Billy's life was one of hardship and challenge. Just three weeks after his birth, his army father, Private William Ashley Sunday, died of pneumonia. His mother, Mary Jane Corey, kept the Sunday family together for the next nine years. Then in 1872, abject poverty forced Mary Jane to send her two sons, Billy and Edward, to the Civil War Soldier's Orphans Home in Glenwood, Iowa. The Soldier's Orphans Home was the first but not the last orphanage for Billy. For almost a decade, he and his brother bounced from orphanage to orphanage.

Sunday was an extremely talented athlete. In 1880, two months before his 18th birthday, he took the first step toward making baseball a career. He was recruited by the Marshalltown Fire Brigade, a voluntary firemen's organization and team. After a short stint with the Brigade, Billy was drafted by the Chicago White Stockings, and his career as a professional baseball player began. His early career was rather inauspicious; but while he was never a starter in Chicago, he managed to stay with the White Stockings for five years. When he was traded to the Pittsburgh Pirates in 1887, Sunday's career took off, and he was

William Ashley Sunday, Jr. (Library of Congress)

elevated to the starting lineup. As his skills grew, so did his salary and status.

Despite Sunday's athletic success and good salary, he was convinced that something was missing from his life. In 1886 he began to see what that might be. It was then that he converted to the Christian faith. A short time later, during a visit to the Pacific Grove Mission, he realized his passion for the gospel and devotion to teaching. Within a few months, Sunday began teaching at the Jefferson Park Presbyterian Church and offering programs at the Chicago YOUNG MEN'S CHRISTIAN ASSOCIATION (YMCA). His abilities as a public speaker made him one of the most popular in the area. At the end of the 1886 baseball season, Billy met Helen Amelia Thompson at a church social. After a short courtship, the couple was married. Helen changed Billy's life. She reinforced his devotion to RELIGION and helped to persuade him to continue this education. It was likely Helen who influenced him to enroll in classes at Evanston Academy on the campus of Northwestern University. While taking classes, Sunday coached local students on the fundamentals of baseball.

It was not long after the couple married that Sunday began to question his future as a baseball player. Even though both Philadelphia and Cincinnati had offered him more money than he had made in either Pittsburgh or Chicago, he decided to end his career as a professional baseball player and devote himself to spreading the word of the Lord. He accepted a job with the YMCA paying a mere \$1,000 a year, significantly less than the \$3,500 that he would have earned playing baseball during the seven-month season. Leaving baseball was a crucial step in Billy's personal, professional, and spiritual development. Sunday apprenticed himself to Reverend J. Wilburn Chapman, a renowned evangelist, in 1884. After working with Chapman for two years, Sunday ventured out on his own. From January 1896 through November 1907, he preached in approximately 70 different communities.

One of Sunday's greatest talents was his ability to reach men and women from different social and economic backgrounds. He was close to many of America's elite. JOHN D. ROCKEFELLER, Jr., became one of his close friends. His friendships with wealthy philanthropists, however, did not make him unapproachable to those on the lower rungs of the ladder. Due in part to his rural upbringing, Sunday retained the ability to speak in a language that farmers could understand. This ease and comfort did not, however, translate to all classes. He often found it difficult to empathize with industrial workers and city dwellers.

Sunday's sermons went beyond scripture. At times they were overtly political. As a devout member of the REPUBLICAN PARTY, Sunday was often criticized for attacking organized labor. He increasingly focused on redeeming American cities from what he believed to be moral sick-

ness. He especially hated what he saw as an urban propensity toward drink. After 1907, he preached his famous booze sermon, "Get on the Water Wagon," at least once in every city that he visited. Until his death, Sunday remained convinced that the moral weakness of the urban poor, not the economic system, was the source of pain and discomfort in American cities.

Sunday's life was highlighted by success in athletics and the ministry, but his life was far from charmed. He was viewed by many as a hypocrite and a money monger. His relationship with his family suffered from prolonged absences. And he was often associated with the extreme views of men such as William Jennings Bryan. In the later years of Sunday's life, his message and style began to lose its appeal. In the early decades of the 20th century, religious liberalism and the Social Gospel arose to challenge conservative Christian churches. With the onset of movies and radio, Sunday soon found his popularity waning, but until his death on November 6, 1935, he remained one of the most influential evangelists on the scene.

## Supreme Court

Like the Roman god Janus, the U.S. Supreme Court in the early 20th century seemed to have two faces, simultaneously looking in different and often opposite directions. Looking toward the past, the Court felt compelled by precedent and belief to continue its property- and contract-protecting jurisprudence. At the same time, the Court considered a worrisome future, driven by Progressive calls for groundbreaking social legislation that was at odds with the Court's beliefs. The Court's task, therefore, was to chart a course that would honor its earlier constitutional principles while according the legislative and executive branches the deference and latitude they required.

No Supreme Court era exists in a vacuum. The issues in the nation affect the Court's deliberations, and, in turn, the Court's opinions affect not only the parties to the litigation but the course of governance and society at large. The early 20th-century Court made its decisions in a society where legislatures sought to create a more activist government that challenged earlier laissez-faire principles. The nation also faced internal dissent associated with WORLD WAR I and the RUSSIAN REVOLUTION even as justices and scholars questioned the role of law and jurisprudence in modern society.

With the rise of Progressive political philosophies, legislatures enacted laws that sought to address the excesses in

America's economic system. In reaction to that legislation, the Supreme Court from 1900 to 1930 invalidated more legislation than it had in its previous history. At the same time, the Court often deferred to the popularly elected branches. While seemingly inconsistent, the Court's opinions suggest that it was trying to balance core laissez-faire constitutional principles with the democratically elected branches' drive to provide for the general welfare.

The Court struck this balance by defining the due process clauses of the Fifth and Fourteenth Amendments to protect citizens and corporations against laws the Court viewed as socialistic while granting exceptions for select social welfare needs. The cases perhaps most reflective of this balance are *LOCHNER V. NEW YORK* (1905) and *MULLER V. OREGON* (1908). In *Lochner*, the Court invalidated legislation restricting bakers' working hours, because that law improperly subjected worker and employer contract rights to "the mercy of legislative majorities" and interfered "with the rights of the individual" in violation of due process. Justice OLIVER WENDELL HOLMES, in a dissent that resonated in the late 1930s, questioned using due process principles to prevent legislative social experiments, even when the Court considered those experiments ill-advised.

In *Muller*, the Court permitted exceptions to its *Lochner* principles in unanimously upholding an Oregon law limiting a woman's workday to 10 hours. Basing its decision on health and safety concerns, the Court accepted Oregon's restrictions in order to protect "women's physical structure and the performance of maternal functions." In later cases, the Court carved out further exceptions to its *Lochner* opinion, even to the point of upholding a law restricting the hours men could work in manufacturing and mining jobs in *Bentley v. Oregon* (1917).

That deference to legislatures slowed with the demise of the Progressive movement. In 1923 the Court invalidated a congressional measure regulating wages and hours for women and children. In that case, *ADKINS V. CHILDREN'S HOSPITAL* (1923), the Court determined that Congress had gone too far in regulating wages and that the legislation struck at the core of an individual's right to contract, in violation of the due process clause of the Fifth Amendment. The Court also took notice of the recently passed Nineteenth Amendment, which granted women the right to vote, suggesting that protective legislation undermined gender equality.

It is not coincidental that *Adkins* limited legislative prerogatives as the Progressive movement declined, just as it is not coincidence that the Court allowed regulations of contract rights in *Muller* and *Bentley* at the height of the Progressive Era. In granting limited exceptions to its contract- and property-protecting rules, the Court somewhat bowed to social forces while holding firm to its core principles. When the Progressive movement's pressures abated,

the Court reverted to the purer *Lochner* standard. The Court followed that approach until the economic upheavals of the Great Depression (see Volume VIII).

Members of the Supreme Court often referred to property and contract rights as individual liberties against which the government could not intrude. In striking down regulatory legislation, the Court deemed itself a protector of those rights and a bulwark against the abuses of majority rule. With the advent of World War I, the Court again faced the problem of protecting individual rights against government intrusion. This time the issue would focus on First Amendment free speech rights. As part of its war efforts, Congress passed a series of laws to protect the nation in time of war, among them the ESPIONAGE ACT of 1917. Charles Schenck was arrested and convicted for violating the act by distributing pamphlets opposing the draft. Schenck appealed to the Supreme Court. Speaking for a unanimous Court in *SCHENCK V. UNITED STATES*, Holmes wrote that CONGRESS could limit speech that created "a clear and present danger" of the "substantive evils that Congress has a right to prevent," in this case obstruction of the draft. In affirming the conviction, Holmes likened Schenck's words to "falsely shouting fire in a theatre."

Later that year, the Court in *Abrams v. United States* revisited the Espionage Act and affirmed a conviction for advocating strikes against munitions factories. While the majority relied on the *Schenck* opinion, Holmes dissented. In that dissent, Holmes tightened his clear and present danger test to require an "imminent danger that will bring about forthwith certain substantive evils." Later Courts would take up Holmes's requirement of immediate danger of substantive evil.

The Supreme Court did not adopt Holmes's imminent danger tests until well after he left the court. In 1925, however, the Court in *Gitlow v. New York* took a substantial step in widening First Amendment protections. In *Gitlow* the Court confronted the conviction under New York's Criminal Anarchy law of Benjamin Gitlow for publishing a manifesto advocating mass strikes and proletariat revolution. While the Court acknowledged the manifesto had no effect, it upheld the conviction, fearing "a single revolutionary spark may kindle a fire that, smoldering for a time, may burst into a sweeping and destructive conflagration." In limiting Gitlow's speech rights, however, the Court ruled that speech was a fundamental personal right protected against state encroachment. The First Amendment now applied to state laws as well as federal laws.

Shortly after *Gitlow* the Court faced another state law case. In *Whitney v. California*, the Court considered Anita Whitney's conviction under California's criminal syndicalism statute for membership in the Communist Party. The Supreme Court affirmed her conviction, but in his concurrence, Justice LOUIS BRANDEIS, offered a new

standard and logic that would be adopted about 50 years later. Brandeis wrote that democratic governance required nearly unfettered speech and that if there was time to answer the speech, with no threat of immediate danger, then the speech was protected by the First Amendment. Between them, Holmes and Brandeis set the standard for speech protection that later Courts would adopt.

While the Court ruled on these important issues, judges and scholars were reassessing how the courts and the law interrelated with society. In 1897, Holmes published *The Path of the Law*, introducing the idea that law and judicial decision making could neither be divorced from societal needs nor could they be viewed apart from the values of the judges. Holmes rejected the notion that judges formalistically applied set rules to facts, as mathematicians would apply numbers to a formula. Instead, public policy did and should play a significant role in judicial decision making. Courts increasingly accepted Holmes's position as they progressively applied laws in a more flexible and pragmatic fashion.

Scholars often view the 1900–30 Supreme Court as archaic. More realistically, the Court should be viewed a body struggling with government's place in an increasingly complex nation. In addressing the balance between personal freedoms and general needs, the early 20th-century Supreme Court set the foundation for many of the liberties Americans now enjoy.

### Sweet trial (1926)

In the summer of 1925, Dr. Ossian Sweet, his wife, Gladys, and nine friends and relatives were arrested for the death of a neighbor while defending their recently bought home against a hostile crowd that had gathered outside. The issue for many was one of racial integration. As one NAACP press release stated, "If in Detroit the Negro is not upheld in the right to defend his home against eviction at the hands of a riotous mob, then no decent Negro home anywhere in the United States will be secure." Supported by the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP) and other civil rights groups, the Sweets declared their innocence with a powerful defense of equal property rights. Participating in their trial were figures of major national significance. Judge Frank Murphy, later

mayor of Detroit and governor of Michigan, presided over the case. CLARENCE DARROW, one of the greatest attorneys in American history, led the defense team, and Arthur Garfield Hays, another prominent liberal lawyer, assisted him. Local and national reporters covered the trial for national and African-American newspapers as the entire country followed the proceedings.

Like many other northern cities, Detroit experienced the growth of racial conflict in the years during and after WORLD WAR I. Chicago, St. Louis, Washington, D.C., and Tulsa had race riots during those years. In Detroit, police brutality against African-American men and small housing riots had left much of the city with a tenuous racial peace. Restrictive real estate covenants and common banking practices, even when not enforced by legal segregation, kept most African Americans from buying houses in mostly white neighborhoods. The habits of racial separation did the rest. The early 1920s saw the revival of the KU KLUX KLAN, with a particularly strong contingent in suburban Detroit. While the Klan spent much of its venom on immigrant workers and Catholics, it also promoted the ideology of white supremacy and enforced its ideas through collective violence. In the mayoral election of 1924, Klan member Charles S. Bowles almost won as a write-in candidate. He was narrowly defeated after the city disqualified 15,000 ballots.

The African-American community in Detroit numbered about 80,000 in 1920. Most African Americans were relatively recent migrants. Centered for the most part on the near east side in the area called Paradise Valley, the community opened Dunbar Hospital, the first black facility in the city, and housed businesses that catered primarily to the migrants. The *Detroit Independent* provided news to black Detroiters, and the local NAACP, United Negro Improvement Association, and the Detroit Urban League played major roles in advocating for African-American causes.

Ossian Sweet, an African-American doctor from Florida, moved with his family to Detroit in 1924, seeking to escape the segregated South by moving to the Motor City. Gladys Mitchell Sweet, his wife, came from one of the oldest African-American families in Detroit, and her elite connections aided her husband in establishing a practice in the city. After their move, the Sweets became part of the expanding community, joining elite St. Matthews Episcopal Church and other local civil rights organizations.

As a follower of MARCUS GARVEY, Ossian Sweet had little patience for racial accommodation and wanted to take the lead in integrating the city. In June 1925, he put a sizable down payment on a house in the largely immigrant northeast sector of the city. Despite racial bars, Sweet was able to buy a modest home on Garland and Charlevoix, a house previously owned by an interracial couple. The

neighborhood, however, had not known that the previous owner was African American, and so the Sweets' purchase of the house raised the ire of some local homeowners. The same year, two other African Americans in Detroit had been removed from their homes in all-white neighborhoods. The homeowners around Waterworks Park had similar aims.

For that reason, when the Sweets moved into their new home, they brought not only two vans of furniture but a generous supply of food, guns, and ammunition, the elements of a siege. Within days the Waterworks Improvement Association, a neighborhood group, set out to evict the Sweets from their home, if necessary through violence. On September 8, 1925, the Sweets moved into their home. They requested police protection, a move that had ambiguous results. The following evening, a white mob had gathered outside the Sweet house and began throwing stones, first at those arriving and then at the house itself. From the house and from police positions outside the home shots were fired. Leo Breiner was killed, and another man, Erik Halberg, was wounded.

Promptly taken into police custody, all 11 of those in the Sweet home, including Gladys Sweet, were arrested for murder. The trial itself juxtaposed the Sweets, who came from the respectable black professional class, with their neighbors, upwardly mobile Polish and Hungarian immigrants and their children. Darrow's defense team played on

the differences of education and respectability between the Sweets and the immigrant mob. In addition, they suggested how the Sweets' state of mind, inflamed by the history of violence directed against African Americans, determined their course of action. Threatened by an angry mob, Sweet and his compatriots defended their rights as citizens and property owners to the same liberties as whites. The first trial of all 11 defendants ended with a hung jury after 46 hours of deliberations. Following the outcome, the defense chose to try the defendants individually. Henry Sweet, Ossian's brother, was tried first, as the only defendant to admit he fired a gun. After only four hours of deliberation, an all-white jury acquitted Henry Sweet and, by implication, all the other defendants. While the Sweet case did not settle the racial troubles of Detroit, the acquittal of the Sweets' actions in defense of their property led the way to further housing integration and improved race relations in the city.

**Taft, William Howard** (1857–1930) *27th U.S. president, chief justice of the Supreme Court*

Often referred to as the “Reluctant President,” William Howard Taft was the 27th president of the United States. Taft was born in Cincinnati, Ohio, on September 15, 1857. Taft’s father was himself a politician and served as secretary of war and attorney general under Ulysses S. Grant. Growing up and as a young man, Taft preferred law to politics. He attended Yale University and graduated in 1878. He then attended Cincinnati Law School and joined the bar in 1880. For the next decade, Taft practiced law in Cincinnati. A large man, 6 feet, 4 inches tall, he weighed more than 300 pounds during his presidency. He was easygoing and hardworking. He made friends easily and quickly earned a reputation for honesty and personal morality. Taft also preferred quiet and stability, tended to procrastinate, and lacked the ability to inspire or motivate audiences. At a time when political scandals and corruption were common, Taft’s reputation enabled him to win appointment to increasingly important judicial positions and the support of Ohio’s REPUBLICAN PARTY.

Taft’s first important break came in 1887, when, at the age of 29, he was appointed to the Ohio superior court. From the early days of his professional career, Taft’s goal was to become a member of the U.S. Supreme Court. Though heavily involved in the Ohio Republican Party, he had little interest in running for political office. Taft served on the U.S. Sixth Court of Appeals between 1892 and 1900. During that time, his judicial rulings were mixed. On several occasions, he ruled against organized labor, upholding a lower court injunction against a railroad strike and a ruling declaring secondary boycotts illegal. On the other hand, Taft supported in principle the right of workers to join unions and to conduct strikes.

Though Taft was more comfortable in the courtroom, his wife, Helen Herron, encouraged him to seek political office. Taft’s political career began in 1900 when President

William McKinley appointed him to oversee the formation of a government in the Philippines and named Taft its first civil governor a year later. During his tenure, Taft created an efficient administration, free from corruption. As civil governor, he established a system of public education and convinced the Catholic Church to sell small plots of land to Filipino farmers. Largely as a result of his success, President THEODORE ROOSEVELT chose Taft to be his secretary of war in 1904. Between 1904 and 1908, he and Roosevelt became strong political allies. When Roosevelt, nearing the end of his second term in office, decided not to seek reelection, he chose Taft to be his successor. Taft was initially reluctant; but at the urging of his wife, family members, and supporters, he agreed to seek the Republican nomination, which he easily won. In the general election, Taft faced Democrat William Jennings Bryan. During the presidential campaign, Taft promised to adhere to the policies established by the popular Roosevelt. Taft defeated Bryan, winning the popular vote 7,679,114 to 6,410,665 and the Electoral College vote 321 to 162.

During his only term in office, Taft was largely ineffective and personally very unhappy. From the outset, Taft aligned himself with the Republican Party’s conservative Old Guard. Led by Speaker of the House JOSEPH CANNON, the Old Guard opposed progressives in their party who wanted the federal government to play a more active role in society. Unlike Roosevelt, Taft did not believe in using the power of the presidency or the federal government to push legislative reforms or achieve social equality. Still, while in office, Taft signed several significant pieces of legislation, including the MANN-ELKINS ACT, which increased railroad regulation, and furthered Roosevelt’s trust-busting agenda by continuing Justice Department investigations of antitrust violations. At the same time, divisions began to emerge in the Republican Party as early as 1909 during the debate over the PAYNE-ALDRICH TARIFF ACT. Wisconsin senator ROBERT LA FOLLETTE and other

William Howard Taft (*Library of Congress*)

midwesterners were vehemently opposed to the tariff, because they believed that it kept prices artificially high and benefited primarily large corporations and eastern financial markets. When Taft called for a special session of Congress to deal with tariffs, he originally intended to have them lowered. However, the final version of the Payne-Aldrich Tariff did the exact opposite. When Taft signed the tariff, he created a split in the party.

Between 1909 and 1911 a series of controversies deepened the divide between progressives and conservatives in the Republican ranks. In 1909 Taft fired the progressive head of the U.S. Forest Service and long-time Roosevelt supporter, GIFFORD PINCHOT, after he disagreed with Secretary of the Interior Richard Ballinger. Hoping to galvanize progressive opposition to Taft and the Old Guard, Pinchot had deliberately provoked a conflict. His firing angered Roosevelt and convinced many progressives of the need to support a different candidate in the 1912 election. In August 1910, Roosevelt delivered a speech criticizing Taft and laying out the idea of the NEW NATIONALISM, which provided the basis for his 1912 presidential campaign.

Finally, in the 1910 elections, Taft and the Old Guard Republicans attempted to unseat or block the nominations of congressional progressives, convincing La Follette to form the National Progressive Republican League. As the popularity of the league grew and the intensity of La Follette's attacks on Taft's lack of leadership intensified, Taft and Roosevelt realized that the dissidents would be a force to be reckoned with in the election of 1912. Initially Roosevelt refused to publicly side with either Taft or the progressive dissidents, but Roosevelt soon announced that he would seek the Republican nomination. Taft felt personally betrayed by Roosevelt. Now being publicly attacked by his mentor, Taft refused to give in. He began touring the country, criticizing both Roosevelt and La Follette. In so doing, he secured the support of enough delegates to the 1912 Republican convention that he was able to defeat Roosevelt's bid to win the nomination. Convinced that they could defeat Taft and the Democratic nominee, WOODROW WILSON, dissidents in the Republican Party formed the PROGRESSIVE PARTY. At their convention in August 1912, they selected Roosevelt as their presidential nominee and California governor HIRAM W. JOHNSON as their vice presidential candidate.

Taft attempted to rally the Republican Party's conservative base in order to stave off defections to the Progressive Party, but his campaign failed to generate much enthusiasm. The election of 1912 was tightly contested. The Progressives hoped they could lure enough votes away from both parties to secure a victory. In the end, though Roosevelt easily outpolled Taft, the party failed to make significant inroads with Democratic voters. Wilson received 6,293,000 votes, Roosevelt 4,119,000, and Taft 3,484,000. The electoral vote was even more decisive with Wilson receiving 435 votes, Roosevelt 88, and Taft 8.

After his defeat in the 1912 election, Taft accepted a position teaching constitutional law at Yale University. During WORLD WAR I, he served on the NATIONAL WAR LABOR BOARD. Following the war's conclusion, he became a strong supporter of the LEAGUE OF NATIONS. In 1921, Taft realized his life-long dream when President WARREN G. HARDING appointed him chief justice of the Supreme Court. Taft served on the high court until his retirement in 1930. During his tenure as chief justice, he made important strides in modernizing the Court and improving its efficiency. Taft's failing health forced him to retire from the Court in February 1930, and he died a month later.

**Tarbell, Ida Minerva** (1857–1944) *reformer, journalist*

Born in Erie County, Pennsylvania, in 1857, Ida Tarbell was one of the nation's first influential female reporters. After studying biology and graduating from Allegheny College in 1880, Tarbell did not intend to become a journalist; but as she struggled to find work as a teacher, she began writing articles to support herself. Concerned that modern day political machines and laissez-faire capitalism were undermining traditional American values, Tarbell committed herself to rooting out and exposing corruption. In 1891 she moved to Paris, where she met S. S. McClure, future owner of *McClure's Magazine*.

Tarbell joined the staff of *McClure's* when it was created in 1894. Labeled MUCKRAKERS, she and other reform journalists LINCOLN STEFFENS, UPTON SINCLAIR, and Ray Stannard Baker turned their attention to the increasing power of corporations and corruption in government. Tarbell began an in-depth investigation of JOHN D. ROCKEFELLER, owner of the nation's largest and most profitable corporation, STANDARD OIL. Between 1902 and 1904, Tarbell wrote a series of articles that exposed the lengths to which Rockefeller went to build and maintain his oil empire. Published in 1904 as *The History of the Standard Oil Company*, Tarbell's expose outraged people throughout the country and contributed greatly to the 1911 Supreme Court decision to dismantle the company for its violation of the 1890 Sherman Antitrust Act. It marked the first time federal antitrust laws had been enforced against an influential national corporation. Tarbell also became a staunch critic of the KU KLUX KLAN and the lynching of African Americans. In the pages of *McClure's*, she spoke out against racism and lynching frequently and eloquently. In 1906, Tarbell, Steffens, Baker, and others left *McClure's* to create the more radical journal, *American Magazine*, where she served as editor until its demise in 1915. Although Tarbell was reluctant to embrace the WOMAN SUFFRAGE movement and held traditional views about the role of women in society inconsistent with her public career, she inspired an entire generation of female reporters and helped to change the shape of American public life.

## tariffs

As a tax on imports, tariffs have been used in the United States to aid and develop the nation's industrial and agri-

cultural sectors since the nation's founding. For this reason, though, politicians frequently have used the tariff to gain political advantage from certain sectors of American society. The central debate in struggles to adjust the tariff has been whether to protect manufacturing and agricultural interests by keeping the tariff rate high in order to minimize foreign competition or to aid consumers with a low tariff that would help keep the price of consumer goods low. Frequent tariff debates have contributed to long-standing struggle over the role of the federal government in the development of the nation's economy. For President Abraham Lincoln and subsequent Republican administrations, high tariff duties became the principle strategy to aid and assist industrial development. According to President Benjamin Harrison, "the protective system . . . has been a mighty instrument for the development of the national wealth." In contrast, the DEMOCRATIC PARTY, as the advocate of states' rights, frequently attacked the protective tariff and called instead for freer trade.

During the late 19th century, a protective tariff was put into place with the passage of the McKinley Tariff of 1890. But as the nation began to face growing concern over the increasing power held by the corporate elite, the tariff became a target of attack for many progressive reformers. Progressives considered protective tariffs a major factor in the consolidation of economic power that had contributed to the decline of competition in the American marketplace. Instead of protective tariffs, progressives argued for a revenue tariff that allowed the federal government to generate needed revenues but did not close the market to less-expensive imported goods. Despite advocating a progressive agenda during his presidential campaign, once in office, President WILLIAM HOWARD TAFT quickly annoyed many progressives when he signed the PAYNE-ALDRICH TARIFF ACT in 1909. The chair of the Senate Finance Committee, Nelson W. Aldrich, guided through Congress a bill that drastically revised and enlarged the tariff on more than 800 items. The tariff caused an acrimonious debate to emerge, with midwestern Republicans charging that the legislation was a throwback to the days when the REPUBLICAN PARTY served the interests of industry without question. By signing the bill, Taft quickly alienated the progressive wing of his party and caused it to split, with the formation of the PROGRESSIVE PARTY by the next presidential election.

Shortly after entering the White House, Taft's successor, WOODROW WILSON, aggressively attempted to address the problem of economic power that the nation had been debating for some 20 years. Topping his list of reforms was the need for tariff revision. Progressives had long advocated a reduction in tariff rates as a way to undercut the economic power of trusts, but they had not prevailed in this endeavor until Wilson took office. As one of his first policy

efforts, Wilson pushed for a lowering of the tariff rates in the United States. From the prevailing average of 40 percent, the UNDERWOOD-SIMMONS TARIFF Act of 1913 pared rates down to an average of 25 percent. The legislation reduced the import duty on more than 900 items, raised them on only 86, and left some 300 items untouched. Because the new tariff legislation especially targeted trust-dominated industries, the Democrats strongly felt that this new tariff would spur competition and reduce prices for consumers by opening protected American markets for foreign products.

With the return of Republicans to the White House in 1921, President WARREN G. HARDING's administration set about restoring many traditional Republican policies, among them a tax cut and a protective tariff. Harding's secretary of the treasury, ANDREW W. MELLON, strongly advocated that both these policies be adopted shortly after the administration entered office. WORLD WAR I had allowed the chemical and metal industries to develop a number of innovative technologies; and they, along with Mellon, argued for protective tariffs to allow them further to develop. The FORDNEY-MCCUMBER TARIFF of 1922 increased tariff rates on chemical and metal products as a safeguard against the revival of German industries, which had dominated these sectors of the international economy prior to the outbreak of hostilities in Europe in 1914.

The global economy witnessed significant changes with the First World War. Accordingly, the imposition of a new protective tariff in the United States had far-reaching consequences that had not previously been imagined by the federal government. In particular, the change of the United States from a debtor to a creditor nation made the international economy increasingly dependent on American investment for economic development. As a result, the onset of economic crisis in 1929 was aggravated by the passage of yet another protective tariff in the United States in 1930. American economic policies had far-reaching ramifications. Given the large war debts and investment loans that European nations owed the United States, there was a vested interest in open movement of capital and goods throughout the international economy. The Tariff Act of 1930, also known as the Hawley-Smoot Tariff, accelerated economic decline both at home and abroad. The tariff was the result of domestic political pressures. Because the agricultural sector of the American economy experienced economic decline during the decade of the 1920s, farmers had become increasingly vocal in their demand for a protective high tariff that would reduce the amount of competition that farmers faced from foreign agricultural products.

With the collapse of the stock market in 1929, Congress responded by enacting the Hawley-Smoot Tariff in 1930, which increased the tariff on 75 foreign agricultural products and on some 925 manufactured goods. Many

industrialists and farmers convinced the Republican-controlled Congress that protection was the remedy to the economic crisis that was unfolding as the United States entered the 1930s. Despite strong reservations from economists, President Herbert Hoover signed the legislation into law. With ad valorem duties from 32 to 40 percent, the highest tariff rate in American history, it effectively closed the domestic market to foreign goods. In response, the United States' trading partners retaliated by imposing their own high tariffs to minimize competition from American products in their respective economies, and the economic crisis deepened.

—David R. Smith

### **Taylor, Frederick Winslow** (1856–1915) *management consultant*

Born into an affluent family, Frederick W. Taylor grew up in comfort in Germantown, Pennsylvania. His father, Franklin, was an attorney. After spending three years in Europe, Frederick entered the Phillips Exeter Academy, a preparatory school. After he graduated, he was accepted by Harvard University, but his poor health and eyesight prevented him from enrolling. He then became an apprentice machinist and pattern maker, the beginning of a career that would lead him to fame as the father of SCIENTIFIC MANAGEMENT. After finishing his apprenticeship in 1878, he took courses in mechanical engineering from Stevens Institute of Technology and earned his degree in 1883.

Taylor worked full time at Midvale Steel Company while he pursued his degree. His first position was tool clerk, the person responsible for keeping time records, and he quickly rose to become gang boss or superintendent. In this position, he became concerned over worker soldiering, or doing only the minimum amount of work required. He instilled a system of differential pay to get more out of his workmen, paying more to those who exceeded a predetermined goal. When they rebelled with minor sabotage, he made them pay for the repairs. Taylor improved efficiency by developing a command and control system based upon what he called functional foremen, or people assigned to oversee a particular task. He also began time and motion studies, using hidden stopwatches and specially designed forms, to determine the amount of work that could be accomplished during a prescribed time.

Taylor's most famous human engineering experiment was with pig iron handlers at the Bethlehem Steel

Corporation. Working in teams, pig iron handlers lifted 92-pound pigs, or slabs of iron, from a pile and carried them onto railroad cars. When Taylor began his study, the handlers moved an average of 12.8 tons per man per day. After watching a gang work at maximum speed, Taylor determined the proper amount to be 47 tons of iron per person per day. Providing workers with precise instruction on how to perform the job as determined by time-motion studies, and motivating them with differential pay, he had workers exceed that goal. One, Henry Knolle, lifted and carried 68.3 tons of iron in one day and received in return \$2.57.

Borrowing heavily from other business theorists, Taylor developed a complex method of cost accounting to complete his system of detailed analysis of every operation in a plant. Critics complained that his management system reduced workers to mere cogs in a machine. They also argued that it was simply a way of driving people beyond their endurance. Taylor's admirers, however, noted that he called for high wages and wanted people to work smarter, not harder. The debate over Taylor's management techniques tends to obscure his inventive nature. He held 45 patents ranging from high-speed steel cutting tools to golf clubs and tennis rackets. His influence, though, spread beyond the industry. Scientific management became the watchword for reform in city government, social agencies, and businesses, and changed the way work in general was organized.

## Teapot Dome

In his 1920 election pledge to “return to normalcy,” WARREN G. HARDING promised voters he would end the pervasive intervention and regulation of the Wilson era. By bringing order to the federal government through such legislation as the BUDGET AND ACCOUNTING ACT and cleaning up such problems as the UNITED STATES SHIPPING BOARD, Harding sought to establish his administration on stable footing. It would eschew reform in favor of honest government. By 1923, however, Harding's hands-off administration was beginning to show a different side. Rumors of misdeeds at the VETERANS BUREAU, gossip about Attorney General Harry Daugherty, and the illegal leasing of government oil lands in a corruption scandal that became known as Teapot Dome began to trouble the president. Many afterward thought that the stress had contributed to his early death.

In 1921, the newly elected president appointed Albert Fall to be secretary of the Department of the Interior, a posi-

tion with vast authority over federal lands and the nation's natural resources. Unsympathetic to conservation policy, Fall was not a popular choice to head the Interior Department. Conservationists feared that his first act would be to transfer the right to log the nation's vast forest reserves to private lumber companies. Instead, Fall had his eye on the oil on Native American reservations and in the naval reserves. The General Leasing Act of 1920 had authorized the secretary of the navy to grant private leases on naval reserve land at his discretion. This left the door open for Fall to intervene. First, however, he declared that the Leasing Act applied to reservations for Native Americans, which were under the authority of the Bureau of Indian Affairs (and hence of the Interior Department). More than 22 million acres of reservation land, Fall determined, would now be open for exploration and drilling. There was widespread opposition to this move. The Indian Rights Association and the American Indian Defense Association, along with organizations such as the General Federation of Women's Clubs, led the charge, labeling Fall's actions outright theft. The leasing plan was soon halted.

Next, having convinced the navy secretary to transfer authority over the oil reserve to the Interior Department, Fall proceeded to lease the oil fields to the highest bidder. Without consulting Congress or the administration, Fall illegally granted leases to develop the naval oil reserves in Salt Creek, Wyoming (also known as Teapot Dome), and at Elk Hills, California, to oil industry magnates Harry Sinclair and Edward Doheny. In exchange for gifts amounting to nearly a half-million dollars, including a \$100,000 “loan” for Fall's Three Rivers ranch and \$200,000 in bonds, Fall signed over the leases without public bidding. Doheny's Pan American Petroleum and Transportation Company expected to net 250 million barrels of oil from the Elk Hills reserve, netting a profit of about \$100 million. Sinclair's Mammoth Oil Company had similar hopes for Teapot Dome. In 1923, as rumors began to circulate about Fall's private deals, he resigned from the Interior Department and accepted employment with Sinclair's Mammoth Oil Company. The Senate Committee on Public Lands began investigating the leases in 1924. They uncovered evidence of the oil companies' gifts and loans to Fall, and they charged him with graft. A Justice Department investigation led to his indictment and conviction. He was sentenced to a year in the Santa Fe prison and fined \$100,000.

In the context of the conservative preference for private investment and corporate development, Fall's willingness to sign oil leases, both on naval reserve lands and in his thwarted attempt to access Native American lands, could be seen as business-as-usual. The Republican Harding administration did not give priority to either conservation of natural resources or preservation. It was the way in which Fall accepted loans and other cash payments for

exclusive leases that incensed his critics. By denying the general public the right to bid on the naval reserves and accepting what amounted to bribes, Secretary Fall was guilty of graft and corruption.

The first cabinet officer to ever be convicted of a crime, Albert Fall also was the only government appointee of the Harding administration whose acts were punished to the full extent of the law. Both Attorney General Harry Daugherty and Veterans Bureau director Charles Forbes faced public approbation but little in the way of punishment. The scandals of the Harding administration, however, had little or no effect on the REPUBLICAN PARTY in subsequent elections. The lack of public furor over governmental corruption may be due to the fact that Harding died in office. There was no evidence of his personal involvement, although he most certainly knew of Forbes's graft and Daugherty's misconduct. The investigations by Montana senator Burton K. Wheeler, who used the hearings as a pulpit to criticize Republican policies, also were perceived as politically motivated. Neither the progressive wing of the Republican Party nor the Democrats were able to make political gain from Teapot Dome and the public disgrace of Harding administration's appointees.

**Terrell, Mary Eliza Church** (1863–1954) *founder of the National Association of Colored Women*

One of an exceptional generation of African-American leaders, including Ida B. Wells-Barnett and MARY MCLEOD BETHUNE, Mary Church Terrell was born in Memphis, Tennessee. The first of two children, Mary (Mollie) was the daughter of Louisa Ayers, the owner of a beauty parlor, and Robert Reed Church, a real estate investor and the first African-American millionaire in the postwar South. After her parents' divorce, Mary went to school in Ohio. She graduated from the classics course at Oberlin College in 1884.

Mary Church returned to Memphis, where her father expected her to act in the role of hostess at social events. Tired of the social round, she took a job teaching at Wilberforce University in Ohio and later moved to Washington, D.C. There, she taught at the M Street School, interrupting her teaching for a two-year stint touring Europe. In 1891, she married Robert Heberton Terrell, who had been principal at the M Street School and a lawyer. He became a justice of the peace and later a municipal judge in Washington, D.C. Mary Church and Robert Terrell had four children, only one of whom, a daughter, Phyllis, born in 1898, survived infancy. They later adopted her brother's daughter, Mary.

Mary Church Terrell (Library of Congress)

For the next few decades, Mary Terrell became deeply involved in community affairs. She devoted much of her energy to the causes of WOMAN SUFFRAGE, racial equality, and education. She served in a range of offices both in government and in voluntary associations. From 1895 to 1901 and 1906 to 1911, she sat on the District of Columbia School Board. In 1896, she was elected president of the NATIONAL ASSOCIATION OF COLORED WOMEN, which had only recently been founded. In 1901, she was named honorary president for life.

Terrell was a prolific newspaper and magazine writer. Much in demand as a public speaker, she lectured on such topics as "The Progress of Colored Women" for the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION as well as speaking on lynching, racial inequality, and disenfranchisement. A light-skinned woman, she could and did pass as white during her travels, but she felt humiliated by the rituals of SEGREGATION. Much of her anger was muted, however, by a personal style that repressed emotions. During WORLD WAR I, Terrell worked as a clerk

in the government, despite her own distaste for its segregated policies. She also picketed the White House for the NATIONAL WOMAN'S PARTY and sat on the executive committee of the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM. After suffrage was gained in 1920, Terrell mobilized African-American women voters for the Republican National Committee and worked on individual campaigns. After her husband's death in 1925, Terrell dedicated her time to writing, speaking, and organizing in the civil rights cause.

In the last years of her life, Terrell was more outspoken with her protests. Struggling against both racial segregation and women's inequality, she became a role model for women and young African Americans. Breaking the color bar in women's organizations, she realized how much further there was to travel. In the 1950s, she helped lead the fight to desegregate public restaurants in Washington, D.C. Terrell died in 1954 at age 90. Terrell's career marked the coming of age of black women's political activism and their new role in civil society.

### Tin Pan Alley

Known as the center of the sheet MUSIC publishing industry, the district of Tin Pan Alley in New York became synonymous with popular music in the early 20th century. It fostered the talents of some of America's greatest songwriters, including GEORGE GERSHWIN and Irving Berlin, popularized music in a wide range of styles from dance tunes to Broadway musicals, and familiarized American audiences with African-American music in its adoption of ragtime rhythms and blues themes. The first successful Tin Pan Alley tunes came from the pen of Charles K. Harris, whose song, "After the Ball," became a success in 1892, when it sold over 75,000 copies. Early Tin Pan Alley songwriters were seen as seedy, dissolute, and disreputable Bohemians. They were constantly on the road, visiting 60 joints a week to plug song music. While one music publisher remarked, "the best songs came from the gutter in those days," the pattern quickly changed. Increasingly after 1900, popular song music came from different sources, including musical composers like George M. Cohan, professionally trained musicians like Gershwin, and popular songwriter Irving Berlin. Music publishers enjoyed enormous success in popular terms, having created new markets by plugging

songs both in popular venues like saloons and music halls and on the VAUDEVILLE and touring show circuits. Stage performers boosted sheet music sales, and new mediums, such as wax cylinder and, later, phonograph recordings, also increased the demand.

Between 1892 and 1905, Tin Pan Alley music publishers enjoyed great success with over 16 best-selling songs, including still familiar standards like "In the Good Old Summertime" (1902), "Sweet Adeline" (1903), and "In the Shade of the Old Apple Tree" (1905). Using a brief piano opening, the songs launched into romantic narratives, many to a waltz rhythm and a repeating chorus. Other anthems, such as novelty songs like "Under the Bamboo Tree" (1902), folk songs, and new ragtime music reached popular audiences through the sheet music of Tin Pan Alley. While African-American songwriters received little attention from the music publishers, ragtime music influenced songwriters such as Berlin, who softened its rhythms in the popular "Alexander's Ragtime Band," published in 1911. With the advent of vaudeville and Broadway musical comedies in the work of Cohan and Gershwin, sheet music linked New York, the epicenter of popular culture, to the rest of the nation. The coming of RADIO, however, eroded the market for sheet music, as did the continued expansion of the music recording industry and the new popularity of sound motion pictures. Increased labor costs and a paper shortage further undermined the cheap prices and large market that had made the rise of Tin Pan Alley possible. By the 1920s, the market for sheet music and the district itself was in decline.

### trade, foreign

Throughout the history of the United States, foreign trade has played a critical role in the nation's development. Between the opening of the 20th century and the economic collapse of the 1930s, foreign trade became increasingly important as the United States emerged as one of the most powerful nations in the world. This power, however, was economic and not military. In 1900, few European nations feared military invasion by the United States. Rather, they found fault with the increasing dominance of U.S.-made goods and America's multinational corporations. Statistics that reveal the growing importance of foreign trade to the ECONOMY of the United States are impressive, but they tell only part of the story. Equally important was the perception

or belief that the continued economic vitality of the nation rested on the very presence of external markets. Accordingly, much of the nation's FOREIGN POLICY agenda during the period between 1900 and 1930 was aimed at maintaining an open door to markets deemed vital to the economic interests of the United States.

On the eve of the Civil War, the United States had a significant trade deficit. In 1860, the country imported some \$354 million worth of goods while exporting only \$316 million. Although it had experienced annual trade imbalances throughout its history, the trend began to reverse course in the 1870s. By 1897, the nation imported nearly double the volume of goods that it had in 1860, but exports had more than tripled to \$1.03 billion. The United States had turned an important corner in its economic development that would allow it to achieve world economic supremacy during the 20th century. In tripling the value of its exports, the United States steadily captured an increasing share of the world market in trade. In 1868 the United States controlled approximately 6 percent of world trade; by 1913, this figure had increased to 13 percent. Not only had the United States increased its market share of world trade, but also the increase in exports was almost entirely accounted for by industrial products after 1900.

The growth of exports was an amazing development, especially given the stiff opposition that it encountered from European nations prior to WORLD WAR I. According to many business leaders, overproduction and insufficient markets had caused the economic crises of the 1890s. Only by securing foreign markets, they argued, could the United States achieve stability. However, it was not the only nation looking for foreign markets. The early 1900s was an era of competition between industrial nations for access and control of raw materials and markets for finished industrial products. American manufacturers were largely able to overcome many of these hurdles (e.g., tariff walls) through the sheer wealth of many corporations that allowed them to launch aggressive ADVERTISING campaigns that promoted their products and their ability to control transportation costs. For example, an enterprise such as the United Fruit Company built and operated its own ships, which allowed it to better control costs.

American companies benefited from the direct assistance of the federal government as well. Foremost in this support was the protection afforded American shipping by the growing power of the U.S. Navy. President THEODORE ROOSEVELT often said that the United States needed to "Speak softly and carry a big stick." On several occasions, he ordered the American military to directly intervene in Caribbean and Latin American nations (for the benefit of corporations such as the United Fruit Company). He approached foreign policy in a very different way, however, when it came to Asia. Indeed, when in 1907 Roosevelt

ordered the so-called GREAT WHITE FLEET to embark on a 45,000-mile world tour, he hoped that the show of American force would preserve and strengthen the nation's economic interests in Asia. Roosevelt's principal foreign policy objective was to maintain the OPEN DOOR POLICY in China, because of its great market potential for American manufacturers.

The importance of exports to the economic health of the nation strongly influenced the actions taken during President WOODROW WILSON's administration. Although the United States took a position of neutrality with the outbreak of war in 1914, many Americans recognized the new economic possibilities of trading when European nations were at war. Accordingly, few connections with Europe were severed. Instead, President Wilson argued that the potential loss of trade with Europe, especially with Great Britain, threatened the country with economic depression. He contended that open and free access to international shipping channels was critical to the nation's economic well-being, a decision that brought American ships increasingly into harm's way. As Germany aggressively employed its new submarine fleet to stop Great Britain's trade, it also interfered with American shipping. It was in the name of free trade and "freedom of the seas" that Wilson declared war on Germany.

During the course of the war, American economic strength continued to grow. Not only did the nation benefit from its continuing ability to export manufactured and agricultural goods during the war, but it also emerged from the war as the leading economic nation in the world. The devastation of the war severely crippled the European economy both in terms of infrastructure and the availability of labor. Europe lost markets and the ability to compete. By the end of the war, European citizens owed private Americans \$3 billion and their governments owed another \$10 billion. Wartime loans from the United States to Europe constituted the primary source of this capital imbalance. While the war marked the emergence of the United States as the leading economic power in the world, it also signaled the increasingly integrated nature of the world economy. Debts tied nations' economies together.

Complicating the ability of European nations to repay war loans to the United States were the reparations that Germany owed to the international community as a result of the TREATY OF VERSAILLES of 1919. Ravaged by war, the French wanted to cripple Germany at the Peace Conference. Accordingly, along with the British, the French were able to have included in the final treaty a "war guilt clause" that held Germany directly responsible for the damages caused by the war. To determine the amount of reparations, the Versailles Peace Treaty established a commission to make a specific dollar amount recommendation. In 1921, the Reparations Commission concluded that the

German nation, which also had been ravaged by the war, owed the international community \$33 billion.

The repercussions of this expensive bill would long be felt, as it destroyed international economic relations for more than a decade. The international trade system depended on the flow of capital between nations to maintain at least a semblance of equitable trade relations between nations. European nations, which owed the United States some \$13 billion, relied on new investments and the sale of goods to raise the capital for repayment of these loans. During the 1920s, however, the country experienced a trade surplus that promised to ruin the international economy. This trade surplus ranged from \$375 million in 1923 to over \$1 billion in 1928. European nations did not create any surplus with which to pay their debts to the United States.

The new U.S. position as dominant economic nation meant that its policies would have far-reaching ramifications. Since the start of the 20th century, the international economy increasingly had become interconnected, and the United States depended heavily on foreign trade and foreign investments. In particular, given the indebtedness of European nations after the war, there was a vested interest in open movement of capital and goods through the international economy. The government's response to the collapse of the stock market in October 1929, however, undermined even further the very health of the international economy. Despite the strong need for the open movement of capital and commodities through the international economy, the Hoover administration imposed the Hawley-Smoot Tariff, which effectively closed the American economy to foreign commerce. Nations around the world responded in kind, closing their markets to American industrial and agricultural goods. Accordingly, the economic contraction was deepened by the shortsighted trade policies imposed by the federal government after the beginning of the Great Depression.

### Trading with the Enemy Act (1917)

Along with the **ESPIONAGE ACT** and the **IMMIGRATION ACT OF 1917**, the Trading with the Enemy Act solidified the anti-immigrant and antiradical sentiments that the federal government came to embrace during the early part of the 20th century. When war erupted in Europe in 1914, the public response in the United States was divided. Diverse

political and ethnic identities contributed to the debate regarding the war in Europe. Anticipating that the United States would enter the war on the side of the Allies (principally, Britain, France, Italy, and Russia), the administration of President **WOODROW WILSON** initiated programs aimed at strengthening a sense of patriotism and national unity. Its efforts culminated in increasingly systematic efforts at the Americanization of immigrants, especially emigrants from Germany and its allies. By 1914, German immigrants still formed the largest foreign-born group, 2.3 million, of the population. In addition, there were more than 2 million emigrants from the various parts of the Austro-Hungarian Empire.

Throughout his first term as president, Woodrow Wilson expressed a concern about the large immigrant population and frequently referred to the need for national loyalty, especially after the United States declared war on Germany in April 1917. Within this context of heightened patriotism, the Trading with the Enemy Act sought to reinforce American nationalism and to garner unity for America's involvement in **WORLD WAR I**. Despite Woodrow Wilson's public image as a supporter of democratic rights (e.g., his Fourteen Points speech), the federal government during the war came to rely on repression to achieve domestic unity and support for the war. Specifically, under Wilson's direction, the Congress passed the Trading with the Enemy Act as an effort to control all international trade and communications. The act provided for the seizure and operation of property in the United States owned by Germans and by enemy aliens (emigrants from Germany, Austria-Hungary, Turkey) and for the control of German assets, which came under the authority of the Alien Property Custodian, **A. MITCHELL PALMER**. He obtained additional authority to operate German-owned factories and licensed German patents to American industrial firms. Patents for dyes and chemicals were particularly important for the war effort and helped to further develop the chemical industry in the United States after the war.

Communications during the war were another area of control. The Trading with the Enemy Act prohibited the publication of news and editorial matter that was critical of the U.S. government, military **CONSCRIPTION**, or the war effort. Section 19 of the act also required foreign-language publications to submit their war-related stories to a post office censor for approval. When censors at the post office deemed a publication to be unsuitable because of its critical stance on the war, that publication ran the risk of losing its second-class mailing privileges, making it extremely difficult to distribute and, subsequently, publish. Accordingly, the Trading with the Enemy Act became a further means for the federal government effectively to quiet voices of dissent. Members of two of the leading organizations opposed to America's involvement in the war, the Socialist Party

and the INDUSTRIAL WORKERS OF THE WORLD, faced arrest and found that circulation of their publications was extremely difficult, as censors at the Post Office objected to their antiwar positions. It broadly denied mailing privileges to other radical publications, including *THE MASSES*, *International Socialist Review*, *American Socialist*, the *Appeal to Reason*, and the *Milwaukee Leader*. For many radical and foreign-language publications, exclusion from the mails was the death knell of the free press. Many closed their doors, unable to meet either the cost of publication or to accept the silence of censorship.

### Triangle Shirtwaist Fire (1911)

A half-hour before quitting time on a Saturday afternoon, March 25, 1911, 147 New York City garment workers perished in a massive fire in one of the city's most notorious sweatshops, the Triangle Shirtwaist Company. The workers were mostly young immigrant women, who worked long hours in hot, cramped, and dusty conditions for low wages. They perished as the result of a fire that began in a bin and spread wildly throughout the factory, lasting only thirty minutes "from spark to ember." As the factory's workers frantically searched for a means of escape, they found that the doors, stairs, and elevators had been blocked by their employers, in what was then a common practice to ensure greater productivity.

Photograph of police placing Triangle Shirtwaist Company fire victims in coffins, March 25, 1911 (*Library of Congress*)

The Triangle Shirtwaist Factory occupied the eighth, ninth, and 10th floors of the Asche Building on New York's Lower East Side. Many of those on the eighth and 10th floors of the building eventually found a way out alive, but the majority of the workers on the ninth floor were not so fortunate. They died from the effects of the fire, or from being crushed as they attempted to slide down the elevator cables, or leapt to their deaths on the pavement below, tangled in each other's arms with flames streaming dramatically from their hair and clothes. Hordes of onlookers witnessed the gruesome sight as fire trucks' efforts were made futile by the bodies strewn on the sidewalk and street, and an escape ladder that could only reach to the sixth floor of the building. The public process of identification of victims by their families was painfully long as the number of victims was so great, and many had been burned or crushed beyond recognition, identifiable only by small details such as the mending of a shoe.

The owners of Triangle, Isaac Harris and Max Blanck, were known as the "Shirtwaist Kings" for their large, efficient garment factories. For their role in creating the hazards that led to the fire, the two men were indicted for manslaughter but later acquitted by a jury. Most employers of the time were not held accountable for the safety of their workplaces. A later civil suit awarded only \$75 to victims' survivors who filed a claim.

The Women's Trade Union League held a public funeral demonstration in which 100,000 workers took to the East Side streets demanding protection for industrial workers. The huge outcry among workers and Progressive reformers in New York led to the creation of the "Committee of Fifty," organized out of a large crowd that convened in the Metropolitan Opera House just days after the fire. The committee comprised leaders from labor, business, civic, and religious organizations. Its leaders immediately demanded that the state legislature conduct a formal investigation. The New York State Investigating Committee was headed by assemblyman Alfred E. Smith and Senator Robert F. Wagner. In subsequent years, the committee was active in proposing 56 laws and aided in the creation of the best industrial safety codes in the nation, which included the installation of fire alarms and sprinklers and the banning of locked doors during working hours. The support for these broad reforms by Tammany Hall boss Charles Murphy inspired the trust of a new generation of immigrants in the Democratic Party's political machine.

While the tragedy of the Triangle Shirtwaist Fire was almost unprecedented at the time, the public's outcry did not guarantee that changes in the safety of industrial working conditions actually would take place. Indeed, previous tragedies had caused citizen outrage, only to be slowly forgotten. Just four months before the Triangle Fire, 25 young women in Newark had similarly lost their lives in a

garment factory fire. The changes in the industrial workplace that followed the Triangle Shirtwaist Fire can be seen as a critical moment in which working-class organizers protested against dangerous working conditions and joined middle-class reformers and pragmatic politicians in making incremental changes. In 1909 and again in 1910, wealthy Progressive reformers and the working women of the Triangle Shirtwaist Factory led shocking strikes that were violently put down but prompted tens of thousands of male and female garment workers in the city to leave their jobs and make demands. Moreover, from 1909 to 1913, the numbers of unionized workers in New York grew from 30,000 to a quarter of a million. At a time when workplace safety was unregulated and WORKER'S COMPENSATION virtually nonexistent, America's workers organized among themselves to make their own demands. The reforms implemented in New York were replicated in urban centers across the nation.

**Trotter, William Monroe** (1872–1934) *civil rights activist*

Reform journalist and civil rights leader William Monroe Trotter was born in Chillicothe, Ohio, in 1872, the son of James Monroe Trotter and Virginia Isaacs. His parents, who originally settled in Massachusetts, returned to Boston shortly after William's birth. His father, James, served in the African-American 55th Massachusetts Regiment in the Civil War. He was a strong advocate for racial equality and a Republican partisan, as evidenced by his appointment as Recorder of Deeds. William Monroe Trotter followed his father's example in challenging the racial norms of the time. Seeking a career in international banking, William graduated from Harvard University summa cum laude in 1895 and earned his master's degree there in 1896. Encountering racial discrimination in the business world, Trotter pursued a career first in real estate and then in newspaper publishing. Trotter married Geraldine Louise Pindell in 1899.

In 1901, Trotter and George Forbes, an Amherst graduate, founded the *Boston Guardian*, a black newspaper that targeted the racism of its time. Challenging the conservative approach of Booker T. Washington, Trotter and Forbes focused their ire on Washington's accommodation to SEGREGATION and his tacit acceptance of second-class citizenship for African Americans. The newspaper influenced public opinion far beyond Boston and its black population. As W. E. B. DuBois, later the leader of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP), wrote, "The *Guardian* was bitter, satirical, and personal; but it was earnest, and it published facts. It attracted wide attention among colored people; it circulated among them all over the country; it was quoted and discussed."

As an ally of DuBois, Trotter participated in the founding of the Niagara Movement in 1905. He left the movement to form his own National Equal Rights League, which focused on direct action and on the role of the presidency in civil rights. When the Niagara Movement formed the NAACP in 1909, Trotter attended its first founding meeting; but he and the Equal Rights League were often at odds with the NAACP's agenda. Trotter remained active in politics, supporting the election of WOODROW WILSON in 1912. When the Wilson administration began to segregate federal office buildings and the number of black federal workers rapidly declined, Trotter led protests against the president's discriminatory policies. In 1915, he coordinated nationwide protests of the film *BIRTH OF A NATION*, based on Thomas Dixon's racist novel, *The Clansman*. Later, in the 1930s, Trotter organized support for the defense of the Scottsboro boys, who had been unjustly accused of sexual assault.

After Trotter's death in 1934, DuBois wrote that "Monroe Trotter was a man of heroic proportions and probably one of the most selfless Negro leaders during all our American history." His militant advocacy of racial equality helped to further the cause of civil rights in the first three decades of the 20th century.

## **Underwood-Simmons Tariff** (1913)

Shortly after entering the White House, WOODROW WILSON attempted to address and remedy the problem of economic power that the nation had been debating off and on for some 20 years. The DEMOCRATIC PARTY had not yet held the office of president in the 20th century and it was hungry for a variety of reforms. Topping its list of initiatives was tariff reform. President Wilson actually convened a special session of Congress to tackle immediately what he perceived was one of the nation's most pressing needs, lowering the tariff. Progressives had long advocated a reduction in tariff rates as a way to undercut the economic power of trusts, but they had not succeeded in trimming tariff rates before Wilson took office in 1913. As one of his first policy efforts, Wilson pushed for a lowering of the tariff rates in the United States. From the prevailing average of 40 percent, the Underwood-Simmons Tariff Act of 1913 pared rates down to an average of 25 percent. The legislation reduced the import duty on over 900 items, raised them on only 86, and left some 300 items untouched. Beyond reducing the overall duty on imported products, the Underwood-Simmons Tariff Act also expanded the list of commodities that could now enter the United States duty free. More than 300 items were now put on this list, including sugar, wool, iron ore, steel rails, agricultural implements, cement, coal, wood and wood pulp, and many critical farm products. Because the new tariff legislation especially targeted trust-dominated industries, the Democrats strongly felt that this new tariff would spur competition and reduce prices for consumers by opening protected American markets for foreign products.

The other pressing issue that Wilson had to address as he sought lower TARIFFS was the fact that the federal government stood to lose a significant source of revenue. Accordingly, the Wilson administration supported a companion initiative to raise the federal government's revenues through domestic programs. Accordingly, Wilson pushed for the adoption of the nation's first FEDERAL

INCOME TAX, which became law when the states ratified the Sixteenth Amendment in 1913. The income tax adopted in 1913 made good on the progressive pledge to reduce the power and privileges of wealthy Americans by requiring them to pay taxes on a greater percentage of their income than the poor. Shortly into his first administration, President Wilson had achieved two longtime goals of the Progressive movement: tariff reduction and a graduated income tax.

## **United Mine Workers of America (UMWA)**

Formed in 1890, the United Mine Workers of America (UMWA) fought numerous battles between 1900 and 1930 to organize the nation's anthracite and bituminous coal miners. When the American coal mining industry emerged in the decades following the Civil War, it relied for labor primarily on British, Irish, and Scottish immigrants, who brought with them the knowledge of mining and a tradition of labor militancy. Although there were attempts to organize mine workers prior to 1890, it wasn't until the formation of the UMWA that these organizing efforts proved effective.

Between 1890 and 1902, the UMWA had considerable success organizing bituminous miners in the eastern United States. Because mining bituminous coal required less skill and expense than the extraction of anthracite coal, the bituminous coal industry was marked by frequent labor disputes, excessive competition, and overall instability. As a result, the Central Competitive Field, which represented eastern mine operators, readily consented to a general agreement with the UMWA. Anthracite mine

operators, however, proved much more reluctant, and it wasn't until JOHN MITCHELL took control of the UMWA in 1898 that the union's attempts to organize anthracite miners began to succeed. The union had to overcome ethnic and racial divisions, differences in skill and wages, and the larger, more efficient, and more powerful anthracite mine operators. Tension between the UMWA and mine operators came to a head in 1902 when 140,000 miners walked off the job. The ensuing ANTHRACITE COAL STRIKE was frequently violent. It lasted five-and-a-half months before President THEODORE ROOSEVELT intervened and the two sides agreed to allow him to arbitrate the dispute.

By the time Mitchell retired as head of the UMWA in 1908, the union had successfully organized most of the eastern coalfields. Prior to the emergence of the UMWA, miners had been organized primarily along craft, racial, and ethnic lines. Much of the union's initial success is attributable to the fact that it was able to overcome these divisions. Mitchell, who realized the importance of organizing the entire industry and overcoming divisions among workers, frequently told miners "the coal you dig is not Slavish coal, Polish coal, or Irish coal. It is coal."

Over the next few decades, the union turned its attention to organizing miners in the western United States. Attempts to organize western miners proved difficult and resulted in considerable conflict and bloodshed. The most notorious incident was the LUDLOW MASSACRE of 1914, when Colorado state militia and private security forces brought in to break the strike murdered 20 miners. Violent clashes were hardly unique to western mines. They occurred almost as frequently in the more heavily unionized East as well. Many of the violent conflicts occurred as a result of mine operators' attempts to break the UMWA's hold in the eastern coalfields. Some of the clashes, such as the 1920 incident in Matewan, West Virginia, turned deadly when company-hired security forces battled with striking miners and local union supporters.

Despite the staunch opposition of mine operators and the ethnically and racially diverse workforce, the UMWA continued to have organizing success. By 1920, the year after John L. Lewis became UMWA president, the union boasted a membership of 384,000 bituminous miners and over 200,000 anthracite miners. Over the course of the next decade, however, the UMWA steadily declined. The decade-long tailspin occurred for several reasons, including wartime overproduction, competition from oil refining, technological innovation, antiunion efforts, and mismanagement by the Lewis leadership. The end result was that the UMWA had stumbled badly by the onset of the Great Depression in 1929. Wages were 25 to 50 percent lower; unemployment and poverty were widespread; and union membership had plummeted below 250,000.

### United States Shipping Board

As the United States faced the possibility of entering WORLD WAR I, one of its most pressing needs was to transport personnel, war materiel, and supplies to the battlegrounds of Europe. Cross-Atlantic transport was in short supply, as the United States had an underdeveloped shipping fleet. To bolster the creation of a strong merchant marine, the Congress created the United States Shipping Board with the Shipping Act of 1916. The board was empowered to operate shipping vessels as the Emergency Fleet Corporation. During the war, the U.S. Shipping Board contracted with private firms to build approximately 18 million tons of shipping vessels. Only about three million tons were built during the war. The government canceled 4.5 million tons of the contracts, and the remaining ships, weighing 10.5 million tons, were completed after the war. With their completion, the government was faced with a major dilemma.

The existence of a new, but outmoded, federal merchant marine fleet presented two problems. First, in the war's aftermath, few supported the idea of a government-owned shipping fleet. Second, the ships built during the war were of an obsolete design, and many of them deteriorated at their docks. In June 1920, noting the state of the merchant marine, Congress passed the Jones Merchant Marine Act, which increased the Shipping Board to seven members and assigned them the task of decommissioning the wartime fleet. During his presidential campaign, Republican WARREN G. HARDING had made the merchant marine a central issue. Once elected president, he appointed Albert Lasker, an ADVERTISING executive, head of the Shipping Board. Lasker's charge was to sell or dismantle the wartime fleet, find a way to subsidize private shippers to build new vessels, and strengthen the merchant marine. A highly competent businessman with many successes to his credit, Lasker promised to relieve the country of its unwanted ships and modernize the merchant fleet.

Over the next two years, the task proved to be far more difficult than originally thought. The Shipping Board found few takers for the rapidly deteriorating fleet, even at rock-bottom prices. In 1921, the Shipping Board had 1,109 steel vessels in operation, with 520 in dry dock. It was operating at a deficit. There also were charges of graft, corruption, and incompetence. Lasker made little headway against these overwhelming problems. While he off-loaded some vessels, he was less successful in eliminating the board's

chronic deficits. With a budget of \$3.5 billion appropriated, it still fell behind about \$150 million a year.

To deal with these problems, the Shipping Board proposed a twofold program. First, the Shipping Board would sell the government's entire merchant fleet, if only for scrap; second, it sought to substitute for government ownership a direct subsidy program for the merchant marine. The cost of the subsidies would be an estimated \$30 million a year, a tremendous savings for the government. In addition, the board proposed creating a merchant marine naval reserve of 500 officers and 30,000 men and an army transport service. The bill failed to pass Congress in 1923. In the face of mounting problems, Lasker resigned as head of the Shipping Board.

By the end of 1927, the United States Shipping Board still owned 823 ships. Deficits continued to rise in maintaining the deteriorating fleet. Lasker's successor was able to dismantle the fleet only by selling the majority of the ships as scrap material. The problem of how to sustain a strong merchant marine was solved only when government subsidies became a permanent fixture through the Merchant Marine Act of 1936.

### Universal Negro Improvement Association (UNIA)

Established in 1914 in Kingston, Jamaica, by MARCUS GARVEY, the Universal Negro Improvement Association (UNIA) became the most significant Pan-Africanist and black nationalist movement of the early 20th century. The UNIA was intimately tied to Garvey who founded it and whose 1923 conviction on mail fraud charges led to the organization's demise. In the brief decade of its viability, UNIA was dedicated to promoting African-American communities and businesses and in establishing a country and government solely for Africans and people of African descent.

The initial platform for the UNIA, as established by Garvey in 1914, called for caring for the needy of the race, civilizing backward African people, and developing schools and colleges for African and African-American youths that would teach a commitment to racial brotherhood around the globe. In addition, it called for the establishment of agencies around the world to protect the rights of Africans and for the creation of commercial and industrial trade among them.

The UNIA was not very successful in its first two years. The organization had only 200 members by 1916. In an effort to strengthen the organization, Garvey came to the United States in March 1916. He undertook a tour of the

United States in which he tried to raise funds for UNIA. During his tour, Garvey was impressed by the conditions of African Americans in relation to those faced by Africans in Jamaica. He hoped that the relative wealth of the African-American community in America and the existence of black leadership would help his organization. In 1916 he decided to move UNIA's headquarters to Harlem in New York City.

The UNIA enjoyed a measure of success in the years following its move to the United States. Answering Garvey's call for the establishment of black-owned businesses, the UNIA bought its own building in Harlem, opened a restaurant, began a newspaper, the *Negro World*, and established a steamship line, the Black Star Line. The Black Star Line was the most visible manifestation of UNIA's philosophy. Garvey believed that the line could function as the core of a worldwide black economy. The black-owned and operated Black Star Line would not only carry black immigrants back to Africa but also would foster trade among blacks in the United States, the Caribbean, and Africa. This trade would form the basis, according to Garvey, of the worldwide black economy of the future. UNIA raised the money needed to buy steamships by selling stock in the Black Star Line. Many African Americans embraced the idea, and UNIA had no trouble selling the stock.

In 1920, UNIA held its first international convention in Madison Square Garden. For one month, 25,000 delegates met to establish the UNIA as an international organization. The convention elected Garvey as the provisional president of Africa and approved a *Declaration of Negro Rights*. The declaration called for equal rights for Africans throughout the world. It named the injustices suffered and demanded equal treatment before the law, access to economic opportunity for blacks, an end to colonialism, and the return to Africa to African rule, and it adopted an African national anthem.

UNIA began to unravel soon after the convention. In 1920–21, the United States suffered through an economic recession. As unemployment skyrocketed among African Americans, sales of Black Star Line stock plummeted. In addition to its financial troubles, UNIA began to suffer from opposition to Garvey's leadership. Critics questioned his financing of the Black Star Line, charging that he was selling more stock than legally allowed. In 1922, Garvey added further fuel to the fire when he met with the second-in-command of the KU KLUX KLAN. His critics charged that he had made a deal with the Klan to remove African Americans from the United States, leaving it as the white man's country that Garvey had always claimed it was. He responded to these charges by purging his critics from the UNIA's leadership. Garvey did not last long enough to take advantage of these moves. He was convicted of mail fraud in a federal court in New York City in June 1923.

The court sentenced Garvey to five years in prison and a \$1,000 fine. After losing his appeal, he began to serve his sentence in 1925. In 1927, President Calvin Coolidge commuted his sentence, and Garvey was deported to Jamaica. The UNIA did not survive Garvey's trial and deportation. He attempted to re-create it in Jamaica, but by the mid-1930s both UNIA and Garvey had fallen into obscurity. In an era of SEGREGATION, the UNIA was a popular expression of African-American discontent. It provided a means for African Americans in the urban North to organize economically and politically. For many, the UNIA was a way station on the journey toward civil rights activism.

### urban reform

During the Progressive Era, a coalition of city politicians, educators, social workers, and others enacted reforms aimed at improving city government and the lives of city residents. Urban reform was a reaction to problems brought on by rapid urbanization and the rule of political machines and urban bosses. Political machines that existed as a competing force within government controlled many city governments. Due to the rapid urbanization of the late 19th century, these governments had difficulty responding to the needs of their inhabitants in finding work or getting relief during unemployment. Political machines stepped into the void by providing supporters with help finding a job or perhaps money in hard times. In return, the machines expected recipients's support at the ballot box. The machines also were able to assist businessmen in gaining franchises for trolley lines and other utilities from the governments. The recipients of the machine's aid then contributed to the its political fund. In many cities, the leaders of the political machine became wealthy during their rule.

The cities run by these machines were, for many of their residents, dangerous and unhealthy places to live. City governments struggled to keep pace with changing urban environments. It was often difficult, for example, to build schools fast enough to keep up with the growing school-age population. Sewers, water systems, and garbage pick-up were overburdened. Many poorer residents suffered from a lack of hospital space. The massive factories that accompanied city growth polluted the air and water, and few residents had access to clean air and green space in which to escape the city's environment.

By the late 19th century, reformers began to blame the problems of the city on inefficient city government, and they specifically targeted the political machines for bribery, corruption, and inefficiency. Reformers concentrated their efforts on structural changes to city government and social changes to improve the lives of city residents.

The structural changes in city government centered around three innovations: citywide elections, commission-style government, and city manager government. Because they blamed the power of the political machines on neighborhood and ward-based politics, reformers enacted laws creating citywide elections. In the older ward-based system, each section of the city elected a member to the city council. Reformers argued that this led to corruption because local saloon owners, as the reformers often characterized ward bosses, could buy the votes of their constituents. By electing council members in citywide elections, it was hoped, each candidate would have to appeal to voters in all sections of the city. The reformers believed that it would end the power of the ward bosses and, not coincidentally, lead to the election of the city business elite.

As adherents to the Progressive Era belief in efficiency and expertise, urban reformers attempted to place experts in control of city governments. This tendency gave rise to the city commission mode of government. Commission government consisted of a board of commissioners elected in citywide elections. Each commissioner was elected as head of a particular city department such as the water department or sewer department. The commissioner then met as the legislative body for the city. One of the purposes for the commission was to make city government more accessible to all its residents. If a resident had problems with his water service, for example, he could contact the water commissioner. Galveston, Texas, became the first city to adopt the commission-style of government in 1901. Des Moines, Iowa, followed in 1908, and hundreds of medium and small cities created city commissions in the following years. The city commission model suffered from the lack of a single leader to coordinate its activities. In response to this problem, reformers created the city manager model of government. In the city manager model, an elected city council hired a city manager to oversee the day-to-day operations of the city. Although few large cities hired city managers, the system did spread to many smaller cities.

For many reformers, the purpose for making city governments more efficient was to improve the lives of residents. Reformers attacked the problem in a number of ways. Reform mayors such as Detroit's Hazen Pingree and Cleveland's TOM JOHNSON attacked the streetcar companies for charging high fares that many residents could not afford and providing poor service. The streetcar companies operated under a franchise agreement with the city. This meant that the city granted the companies the right

to build streetcar lines in return for tax payments. Under the administration of reform mayors, the franchise agreements were renegotiated. The new agreements called for increased tax payments and lower fares. Reformers also attacked the electric and gas companies for making exorbitant profits. Many argued that public utilities should be owned by the cities, which would then charge the customers less for their utilities. Municipal ownership never emerged, but the reform movement did result in greater regulation of utilities by the states.

Other nonelected officials played a significant role in reshaping cities. City planning became a new profession in the early 20th century. City planners attacked the inefficient and wasteful growth of cities. They believed that, if planned properly, cities could grow while remaining pleasant places to live. To this end, they created city plans that included, for example, park spaces and curving roads meant to break up the monotony of gridline streets and large buildings. The urban planning movement gave rise to property zoning. First established in New York City in 1916, zoning put restrictions on the type and structure of buildings that could be built on certain properties. Zoning quickly spread to other cities.

In addition to the efforts of reform mayors, private citizens undertook efforts to improve living conditions in cities. These reformers investigated factories and tenement houses, for example, and publicized their findings in order to force city governments into improving conditions. Many of these reformers, such as FLORENCE KELLEY of Chicago, attacked a problem first as a private citizen and then went to work for government agencies. Kelley first investigated working conditions in Chicago's factories as a resident of Hull-House. Her findings played a key role in the establishment of an Illinois factory inspection law and she was named the state's first factory inspector.

## urban transportation

Developments in transportation technology played an integral role in shaping American cities. Transportation developments such as the electric streetcar, the subway, and the automobile made it possible for city residents to spread out,

which led to a tremendous expansion in the size of cities. It also shaped settlement patterns within individual cities. The shape and size of American cities today are a result of these early urban transportation developments.

Until the mid-19th century, the size of cities was constrained by how far city residents were willing or able to walk. Cities developed compactly therefore. In the mid-19th century, horse-drawn public transportation was introduced, first the omnibus and then the streetcar. The horse-drawn streetcar greatly expanded the distance that residents could travel to work. By the 1890s, cities had changed from horse-powered to machine-driven transportation. The first machine-powered urban transport was cable cars. They ran by gripping a moving cable that ran under the street. There were a number of problems with cable car operation, however, and they soon lost out to electric streetcars. Drawing power from electrical wires strung overhead, the streetcars—or trolleys, as they were often called—greatly increased the range of urban transportation. Electrification also allowed the development of subways. Boston built the first subway system in 1897, followed by New York in 1904 and Philadelphia in 1908. The electric streetcar and subways helped the cities expand and shaped the pattern of settlement within the cities.

Electric trolleys shaped the spatial distribution of residential, economic, and recreational activities. Traveling at speeds ranging from 10 to 15 miles per hour, the trolley cars allowed residents to live farther away from the city center than in the past. The residents who moved out of the city center moved into neighborhoods organized along trolley lines. The walk to catch the trolley was still a limiting factor in residential choices. This dynamic led to a radial arm or spoke-and-wheel pattern of settlement in which the most densely populated areas of the city followed the trolley tracks.

The pattern of trolley lines also played an essential role in the growth and vitality of central business districts. Almost all trolley lines traveled from the city fringes to the central business district. There were very few crosstown lines. The practical effect of this was to force almost everyone who used the streetcar system to rely on the central business district. The central business districts witnessed an unprecedented building boom during this time. Not only corporate offices and financial institutions settled in the central business district, but also entertainment venues such as VAUDEVILLE and motion picture theaters and stores emerged. Depending on the trolley lines to bring thousands of riders a day to their doorstep, the large department stores that came to characterize shopping emerged during this period.

The owners of trolley lines also acted to reshape the spatial distribution of entertainment activity by encouraging pleasure riding. They realized that they could make

Electric trolleys were a growing form of urban transportation. (*Library of Congress*)

more money if residents rode their lines for more than trips to work and shopping. Therefore, in order to attract riders, streetcar line owners built parks, racetracks, beer gardens, amusement parks, and baseball parks on their lines. Every city that had trolley lines had amusement parks at the end of them. Baseball owners built their new stadiums at the end of lines or where multiple lines intersected. The Brooklyn team became known as the Dodgers because fans had to dodge so many trolleys outside the stadium.

Electric streetcars contributed to the social differentiation and separation among city residents by making it possible for the wealthy and middle class to move out of the city center while the working class stayed. This rearrangement of people altered the social landscape of cities as residents sorted themselves out based on economic class and race, instead of ethnicity. The wealthy and middle class followed the streetcar lines and settled in the outer sections or in SUBURBS. Working-class residents were left behind where they lived in the older housing stock that had been abandoned by the wealthy.

The heyday of the trolley car was relatively short. In 1908, the same year that Philadelphia was completing its subway system, HENRY FORD produced the first Model T.

The automobile soon bypassed the electric streetcar as the preferred mode of urban transportation, and by mid-century streetcars had vanished from city streets. Henry Ford played an important role in the development of the automobile as a mass transportation technology. He did this by producing an automobile that a significant proportion of Americans could afford. From 1910 to 1924, the price of a Model T dropped from \$950 to \$290. Led by Ford, automobile production boomed between 1910 and 1930. In 1905 there had been 8,000 automobiles registered in the United States. By 1915 there were over 2 million, and by 1925 Americans owned 17,481,001 automobiles. In addition to the automobiles owned for private use, the number of trucks for use in commerce skyrocketed from 1,400 in 1905 to 2,569,734 in 1925.

The automobile required a revolution in road building. City roads at the beginning of the century were unpaved and in poor condition. Whereas a horse might be able to step around the numerous potholes, automobiles could not. To meet the needs of automobiles and increase profits, a coalition of private LOBBYING AND INTEREST GROUPS, including tire manufacturers, parts suppliers, oil companies, service station owners, road builders, and property

developers promoted road building. Government officials succumbed to the pressure and used public money to build roads. Initially, local governments concentrated on improving existing roads but soon launched a program to build entirely new ones. The development of new roads helped usher in a change in the way Americans thought about them. Before the rise of the automobile, roads had provided an open space that performed a recreational function. By the 1920s, city residents saw roads primarily as thoroughfares for cars. In order to deal with the traffic congestion, cities began to build roads restricted to automobile use and provided them with limited access. The first of these was the Long Island Motor Parkway, completed in 1911.

The rise of the automobile and the construction of road systems reshaped the spatial distribution of urban activities. Residents were no longer dependent on the streetcar lines and no longer needed to live within walking distance of them. Residential areas filled in the spaces between the old radial settlements, and urban populations became more evenly distributed. In addition to the new settlement pattern within the cities, automobiles made it possible for more Americans to leave the cities for the suburbs, which established a new spatial distribution between cities and their suburbs. By allowing urban residents to travel freely between different areas of the city, the automobile created a significant drain on the central business district. Cross-town roads meant that residents were no longer funneled to the city center by the transportation system. The outer areas of cities began to develop their own business areas, aided in part by the adoption of the truck for commercial transport. By the 1930s the modern urban transportation system dependent on the automobile had developed. As Americans expanded their use of the automobile, the effects on the central city intensified and suburbs became the major site for new growth.

## U.S. Steel

Created in 1901, United States Steel was immediately the nation's largest industrial manufacturer and helped revolutionize American industry. U.S. Steel evolved out of the

steel empire created by industrialist Andrew Carnegie. Beginning in the 1870s, he capitalized on technological advances in the production of steel and quickly dominated the fledgling American steel industry. In 1889, Carnegie and his partner, Henry Clay Frick, consolidated all of their steel holdings to create the Carnegie Steel Company. With a net worth of \$25 million, the company was immediately the most valuable in the country.

Between 1889 and 1901, Carnegie and Frick expanded both the size of Carnegie Steel and their control over the nation's steel industry. Emulating the practices JOHN D. ROCKEFELLER introduced at STANDARD OIL, they streamlined production in order to maximize profits. They also integrated all aspects of steel production and distribution under the control of a single company. By 1890, Carnegie Steel controlled the entire production process, from the extraction of raw materials, to the delivery of those materials to the mill, through to the sale and distribution of the finished product, all of which enabled the corporation to maximize profits and undermine competitors. For Carnegie, maximizing profits also meant keeping wages low and workers unorganized. In 1892, when workers organized by the Amalgamated Association of Iron, Steel, and Tin Workers struck at the company's Homestead plant, Carnegie used Pinkerton private security guards to attack striking workers, replace them with scab workers, and break the union. Carnegie's chief rival in the steel industry was Elbert H. Gary, who had created the Chicago-based Federal Steel Company.

The genesis for U.S. Steel began in 1900 when Carnegie, whose relationship with Frick had become strained, announced that he intended to retire. Upon hearing news of Carnegie's impending retirement, financier Charles M. Schwab approached both Carnegie and Gary about merging the two steel giants. After securing additional funding from banker J. P. Morgan, Schwab was able to engineer the merger and the formation of U.S. Steel in 1901. With an initial capitalization of \$1.4 billion, U.S. Steel instantly became the largest corporation in the world and marked the pinnacle of an era of industrial mergers and monopolies. Public concern about the emergence of such wealthy and consolidated corporations, widespread before the creation of U.S. Steel, intensified over the course of the next decade. The emergence of a billion-dollar monopoly in an industry essential to industrial vitality prompted progressive reformers, radicals, and even some old-money conservatives to call for enforcement of the Sherman Antitrust Act, which since its passage in 1890 had been used more to undermine organized labor than regulate corporate mergers.

Between 1900 and 1930, U.S. Steel remained one of the nation's largest, wealthiest, and most antiunion corporations. The company employed a number of tactics to keep its workforce nonunion. In addition to keeping its work-

force divided along racial, ethnic, and craft lines, U.S. Steel created company towns, which not only reinforced these divisions, but also ensured that workers would be dependent upon the company for food, clothing, and housing. In 1909, Gary, who took over the day-to-day operations after Carnegie retired, announced that the company was committed to an open shop policy and would no longer employ unionized workers. (See also OPEN SHOP MOVEMENT.)

Attempts to unionize U.S. Steel's workforce and the company's bitter opposition to such efforts came to a head in the STEEL STRIKE OF 1919. U.S. Steel had tolerated organizing efforts during WORLD WAR I, but the temporary truce between labor and management ended almost as soon as the war came to an end. Wages were lowered, workers fired, and hours extended as tensions again esca-

lated. When U.S. Steel refused to negotiate, members of the Amalgamated Association of Iron, Steel, and Tin Workers voted to go on strike. On September 22, 1919, approximately 365,000 steelworkers walked off the job. Once again, the company responded swiftly and forcefully, hiring scabs to cross picket lines and private security forces to provoke and attack striking workers. The strike was eventually broken. U.S. Steel continued to fight unionism at its factories until the formation of the Steel Workers Organizing Committee in the 1930s.

# V

**Valesh, Eva McDonald** (1866–1956) *journalist, lecturer*

Labor journalist and political reformer Mary Eva McDonald Valesh was born the daughter of carpenter and trade union activist John McDonald and Elinor Lane in 1866 in Orono, Maine. At age 12, Eva McDonald moved with her family to Minnesota. Trained as a teacher, McDonald had little desire or aptitude for teaching and chose, instead, to work as an apprentice printer and later as an investigative labor reporter for the *St. Paul Globe*. Her first article, “Mong Girls Who Toil,” published in 1888, sparked the interest and engagement of its urban audience and especially women working in a local garment factory. A few weeks later, when the garment workers went on strike due to wage cuts and harsh management, McDonald’s article was credited with having inspired the protest. The strike catapulted McDonald, at the age of 22 years, into citywide and even national significance. Both local labor leaders and the nationally known Minnesota populist, Ignatius Donnelly, recognized McDonald’s ability to write and speak to the burgeoning number of working women and their families. She wrote widely for labor and reform newspapers and appeared at several national conventions, where she met and formed a friendship with Samuel Gompers, president of the AMERICAN FEDERATION OF LABOR.

After a string of successes in local and state politics, McDonald married trade unionist Frank Valesh, and they had a son, Frank. Eva Valesh’s ambitions were far greater than those of her husband, and they soon separated. Valesh left for New York, where she wrote for the Hearst newspaper, *New York Journal*, and she later moved to Washington, D.C. There she ran a public relations business, wrote and edited freelance, and eventually reestablished her friendship with Samuel Gompers. In 1900, Gompers hired her as a general organizer and assistant editor of the journal *American Federationist*. In the 10 years she edited

the journal, Valesh broadened its coverage and authored individual articles, including several on child labor, immigration, and working women. After a dispute over editorial credit for the journal, Valesh resigned from the AFL. She relied on her connections in the conservative NATIONAL CIVIC FEDERATION to provide her with a livelihood as a writer, publicist, and political consultant and organized club women. She married again, this time to a New York socialite named Benjamin Franklin Cross, who supported her club work. Together they published a journal, *American Club Woman*, and dabbled in other social reform work. In 1926, after having published the journal for a few years, Valesh ended her second marriage and abandoned JOURNALISM as a career. For 25 of the last 30 years of her life, Valesh worked as a proofreader for the *New York Times*. She died just short of her 90th birthday in 1956.

Eva McDonald Valesh had a life that was extraordinary for her time and that demonstrated the possibilities and limitations of social reform. She repeatedly broke through barriers to women’s participation in labor organizing, politics, and journalism, advancing from her working-class background in later life when she socialized and organized with elite women and married a wealthy man. While society often stigmatized women workers as unskilled, unstable, and morally loose, Valesh’s writing revealed working women’s lives as both at risk in the industrial cities of the time and also enriched by urban culture. She shared many of the attitudes of her age, with regard to immigration and gender, but she also saw new possibilities for women to create cross-class alliances and mutual aid. One of a new generation of reform journalists and labor organizers in the early 20th century, Valesh was able to educate public opinion on the plight of workers, and especially working women, in the age of mass production.

### vaudeville

A form of theatrical entertainment consisting of a variety of acts, vaudeville was the most popular form of entertainment in the early decades of the 20th century. The secret to its success was the range of entertainment it offered. Vaudeville theater included acts such as singers, comedians, acrobats, animal trainers, dancers, and jugglers. This variety appealed to a broad range of audiences, which meant economic success for theater owners. Vaudeville also set the pattern for much of the popular entertainment of the 20th century. Many of the best-known names in American show business got their start in vaudeville.

Vaudeville, in the form in which it gained popularity, developed in the late 19th century, partly due to changes in the business ownership of theaters. Prior to this time, theaters were owned on a local basis. This meant that per-

formers had to contract with individual theaters, which was difficult. In the late 19th and early 20th centuries, a group of entrepreneurs began to buy theaters throughout the country. These men then established syndicates with theaters in each major U.S. city. Performers then needed only to sign one contract for a tour of the United States. The new syndicates undertook efforts to transform vaudeville into respectable entertainment. In its earlier form, vaudeville had appealed to young males through ribald acts, and the audiences often participated by heckling the acts on stage. The new syndicates realized that they could sell more tickets if they appealed to a wider audience and, therefore, cleaned up vaudeville both in terms of the acts and the behavior of the audience. The syndicates also created a star system and relied on it to fill seats. Performers such as Mae West and W. C. Fields, later stars of the MOVIE INDUSTRY, became draws on their own. Because they helped fill seats, they were paid more.

The success of vaudeville owed much to the social and economic changes of the time. As urban populations grew, there was a built-in audience for new forms of popular entertainment. The sheer numbers of people available in cities helped fill the theaters. Economic changes also built audiences. The rise of large-scale corporate capitalism created new managerial jobs. The men who filled these jobs enjoyed a higher standard of living than clerks had previously, and they had more money to spend on leisure. Many middle-class women, whose husbands worked in these new managerial jobs, enjoyed more leisure time and more money with which to enjoy it. In addition, many younger unmarried women were working outside the home, earning money with which to purchase entertainment. Families in general were enjoying more leisure time as the hours of work declined.

The theater owners pursued potential audiences by tailoring the shows to the audience. In theaters located in working-class and immigrant sections of cities, tickets were cheaper; but the big stars never played these venues. Performances might include parodies of wealthier citizens or other jokes meant to appeal to the audience. Theaters located in the center of cities, usually close to the central business district and main shopping areas, catered to middle-class audiences. Tickets were more expensive; but for a higher price, the audiences got to see the stars of the day perform. Performances in the higher-priced theaters emphasized more genteel acts. They would often include ethnic jokes that poked fun at the working-class immigrants then streaming into the United States. Many of the vaudeville acts thus helped maintain stereotypes about ethnic groups. Performers also altered their performances in different parts of the country. They quickly learned that what New York audiences found entertaining, audiences in Milwaukee, for example, might not. The strength of vaudeville

Poster for a popular vaudeville act (Library of Congress)

and the key to its success was its ability to change nightly and regionally.

The role played by vaudeville in spreading stereotypes is paradoxical, given that most of the performers came from immigrant working-class backgrounds. In New York City in particular, vaudeville was seen as a ticket out of the immigrant ghetto; and it was from these immigrant ghettos that many of vaudeville's best-known performers emerged. Its working-class origins helped vaudeville play a role in the cultural transformations of the era. Performers helped shape new ethnic identities that became part of American culture. By lampooning the genteel ways of the middle classes, performers helped weave the egalitarian thread in big-city culture. Furthermore, when traveling outside New York, the performers introduced New York culture to audiences across the country. In this way, vaudeville contributed to the development of a national culture.

Vaudeville declined due to competition from radio and film and the onset of the Great Depression of the 1930s. Whereas in earlier days, one could see the star performers only by attending vaudeville shows, radio brought these performers into America's homes. Films actually began as part of vaudeville shows. Some of the less expensive vaudeville theaters would show short clips as part of the performance. In the early years, movies did not threaten vaudeville; but as the quality of films improved, more theaters began to show them. The newer films, which had better quality both in terms of picture and story lines, began to play a larger role in vaudeville performances. By the end of the 1920s, only four vaudeville theaters in the United States were not showing films as part of their performances. The introduction of sound into films made them even more attractive for Americans. When the economic depression of the 1930s hit, vaudeville, already teetering on the edge of collapse, declined and never recovered.

Despite its short reign, vaudeville played an important role in setting the pattern for American entertainment of the 20th century. It played a key role in the cultural transformation that took America from the Victorian age to the modern day. It substituted for the older culture of hard work, asceticism, and morality a new urban vision of success and happiness based on luxury and consumption. Vaudeville's legacy included the creation of a mass audience consisting of people from all walks of life. In addition, vaudeville was the first entertainment industry. The syndicates that controlled theaters across the country were precursors to large movie and music corporations. The syndicates relied on stars to attract an audience. The movie industry quickly learned to copy vaudeville's star system. Performances often tested the boundaries of propriety, and they were censored only by the theaters, a situation that paralleled the later film rating system. Vaudeville was the first entertainment form to commercialize ethnic cultures.

It also gave ethnic and racial outsiders a chance to join the mainstream through entertainment. Vaudeville was more than just a type of entertainment; it was the beginning of the modern entertainment industry.

### Versailles, Treaty of (1919)

Drafted during the Paris Peace Conference, the Treaty of Versailles was the peace settlement signed after the armistice ending WORLD WAR I, on June 28, 1919. In the Palace of Versailles outside Paris, the Allied and associated powers meeting with representatives of 37 countries brought the four-year worldwide conflict to an end by negotiating a peace treaty to be presented to Germany. The four major Allied powers (Great Britain, France, Italy, and the United States) attended, as well as delegates from many other nations who sought recognition for their contributions to the war. Large numbers of unofficial representatives thronged the corridors. Germany, the successor states to Austria-Hungary, and Turkey were not invited, as they had officially surrendered, and the recently established Soviet government in Russia was excluded as well from the negotiations.

President WOODROW WILSON led the U.S. delegation, despite the warnings of many of his advisers. They feared that he might lose influence domestically if he did not prevail in Paris. Wilson was, however, welcomed as a hero to France. Having caught the imagination of many Europeans, he was at the height of his popularity worldwide. The "Big Four," including David Lloyd George of Great Britain, Georges Clemenceau of France, Woodrow Wilson of the United States, and Vittorio Orlando of Italy, controlled the decision making. Throughout the war, Wilson had advocated a fair and balanced settlement that did not impose harsh terms and conditions on those defeated. His Fourteen Points were the basis for a "peace without victory." Despite Wilson's popularity, he was not able to persuade the Allies to agree to his terms for peace. The others believed Germany had to be weakened and ultimately took control; they signed a treaty very different from what Wilson had envisioned. The Treaty of Versailles represented a victory for the French demands for security, modified by British concerns for continental stability. Wilson's single-minded pursuit of the League of Nations and a policy of national self-determination also shaped the treaty.

The treaty began with the Covenant of the LEAGUE OF NATIONS. The league was to be a form of world government with countries committing themselves to further peace by negotiating conflicts among themselves. The league was intended, according to Woodrow Wilson, to operate as a “partnership of the great and free self governing peoples of the world.” It was meant to make it a “matter of certainty that thereafter, nations like Germany would not have to conjecture whether nations would join against them but rather, would know that mankind would defend to the last the rights of human beings.” By creating a court of international justice, the league would substitute the process of mediation and arbitration for the brutal process of war. All members sought to advance the human condition. Members were bound to advance humane conditions of labor for men, women, and children. Wilson, therefore, called it a “magna charta” for labor.

The League of Nations, however, was only one part of the treaty. War reparations formed the majority of the treaty’s priorities. The treaty reduced the population and territory of Germany by approximately 10 percent by its terms. Alsace and Lorraine were returned to France, and the Saarland (formerly German) was placed under the supervision of the League of Nations until 1935. In the north, three regions of Germany were given to Belgium, and northern Schleswig was returned to Denmark. The nation of Poland was resurrected from most of western Prussia and Posen and part of Upper Silesia. All of Germany’s overseas colonies were made into “trusteeships,” or mandates, controlled by Britain, France, Japan, and other Allied nations. The land ideally belonged to the people who lived on it, according to Wilson’s Fourteen Points, but in 1919, the British and French Empires were at the apex of their power. They would not extend self-determination to the non-European world. The concept of mandates acknowledged the direction in which Wilson wanted to move to realize self-determination. A few countries like India, Egypt, and Turkey had produced nationalist movements and they sought freedom from European rule or interference. In Turkey, the Nationalists under Mustafa Kemal established their own republic in opposition to Allied plans. Other countries had to wait for self-determination. The national frontiers drawn at Paris lasted until 1938–39 and even then survived the periods of Nazi and Soviet domination with few changes.

The Versailles Treaty created four new nations. They were Finland, Latvia, Estonia, and Lithuania, formed from what had been the Russian Empire. Yugoslavia was created from the Austro-Hungarian Empire, including Serbia and Montenegro; and Czechoslovakia was created mostly from Austrian lands.

The “war guilt clause” declared Germany as the aggressor, and the Big Four sought to ensure that Germany would

never again be a threat to Europe. To this end, the German army was restricted to 100,000 men. It had no reserves, conscripts, tanks, aircraft, or general staff. Its navy was reduced to a coastal defense force, as French leader Clemenceau demanded. Germany was held responsible for making reparations to the Allied nations in payment for losses and damages sustained during the war. Although the Versailles Treaty did not stipulate the exact amount, the sum settled upon was so high as to be beyond Germany’s ability to pay. War debts and reparations eventually upset international economics.

On June 28, 1919, Germany’s new Weimar Republic representatives signed the treaty. It was according to Germans, a “dictated peace,” quite unlike the one that Wilson had envisioned. The treaty aroused resentment in Germany, which felt it had been betrayed. Wilson’s Fourteen Points had promised the Germans their territorial integrity. Too harsh a peace, Wilson thought, would impoverish and destabilize Germany. The other defeated states were dealt similar terms for peace. Resentments about the war colored international relations and domestic politics for the next two decades, culminating in World War II.

Many, including the British economist John Maynard Keynes, predicted that Germany would not be able to pay the stipulated reparations and that the terms of the treaty would destroy the world economy. The decision to delay stipulating the exact amount of reparations was a major error. Lloyd George had hoped that this would satisfy the demand for reparations, yet give sufficient time for tempers to subside. Instead, as the Americans withdrew from the treaty process, it became a continual, ongoing battleground with the German government.

There were three other major problems mentioned in relation to the treaty’s terms. First was the isolation of Russia from western Europe by buffer states along its western border. Second, the terms left the German people weak and bitter toward the Weimar Republic. Popular discontent allowed the gradual emergence of a dictator. Finally, the Versailles Treaty did not include Germany in the planning of the League of Nations, which led to the league’s undoing.

The Versailles Treaty met with much opposition in CONGRESS when President Wilson returned from Paris in 1919. Wilson’s DEMOCRATIC PARTY had lost control of Congress in the election of 1918. Although Wilson had urged the people to support his mission in Europe by returning a Democratic Congress, the people voted for Republican majorities. Ambivalence toward the war resurfaced. Senator HENRY CABOT LODGE led the opposition in their attempts to defeat the ratification of the treaty. President Wilson again attempted to appeal directly to the people and initiated a speaking tour of the country to urge support for the treaty. He suffered a stroke halfway

through his speaking tour. In Wilson's absence, Congress voted against ratifying the Treaty of Versailles.

The Paris peace treaties were considered a disappointing end to the long, protracted struggle of World War I. It was commonly claimed that the Treaty of Versailles was too harsh to conciliate Germany and too soft to restrain it. It was not enforced, mainly because France sought strict compliance and Britain, appeasement and revision. The balance of power that had existed prior to the world war was destroyed. France was too weak to maintain the balance on her own. The treaty did, however, establish the League of Nations, a seminal beginning to institutions of international cooperation. It also set up national boundaries in Europe that, except for Poland, are substantially the same today.

## veterans

By the 1890s, Civil War pensions for Union war veterans had become a major source of political power and political conflict. The Grand Army of the Republic (GAR) remained the most powerful veterans' group in the early years of the 20th century, despite new organizations such as the Veterans of Foreign Wars for those who served in the Spanish-American War. With the entry of the United States into WORLD WAR I, however, a new generation of veterans came to the fore. What, some wondered, would these new veterans demand? Because many progressive reformers viewed the military pension system as a font of political corruption and a waste of tax revenues, they were eager to find ways to avoid similar demands from the more than four million veterans of the AMERICAN EXPEDITIONARY FORCE. After the war, both as members of the AMERICAN LEGION, a powerful new veterans' organization, and as individual citizens, veterans demanded compensation for the lost wages and opportunities of their war service. In addition, through the legion, conservative war veterans had a voice in FOREIGN POLICY, military funding, and even labor relations in the years between 1919 and 1930.

At the turn of the century, hundreds of thousands of Civil War veterans, their widows, and children, continued to play an active role in politics through such organizations as the GAR, the Sons of the GAR, and Confederate war veterans' organizations. In periodic gatherings called encampments, dwindling numbers of veterans reenacted Civil War battles, reminisced about the war, and made symbolic gestures of reconciliation with their former foes. American political life was tinged, even at that late date, with refer-

ences to the great struggle of the Republic. Because the REPUBLICAN PARTY thrived on high TARIFFS and the pensions they funded, Republican presidents played a major role in liberalizing what were once disability pensions into a general pension system. By a 1903 executive order, President THEODORE ROOSEVELT established pension eligibility to cover old age. In 1912, Congress passed a bill that expanded the system again. In 1900 alone, nearly a million war veterans and their dependents were in the system at a cost of over \$142 million a year; in 1909, the cost had grown to \$162 million. Spanish-American War veterans, despite the more recent memory of struggles, were far less successful in capturing benefits from military service.

The cost of "the pension racket" troubled those who wanted a more rational and efficient state. Once the threat of war again existed in 1916, opponents of the patronage-ridden military pension system sought to avoid the same problem in the next war. American intervention in the European war meant not only the development of ways for the government to recruit or conscript a fighting force but also calculating what compensation those serving in the new army should receive. With nearly five million soldiers in the armed forces, there were broader social, economic, and political consequences as well. Planners wondered how the economy would adjust to the drain on its labor supply and what were the potential social and economic dislocations caused by millions of returning veterans. Government officials and progressive social scientists engineered a new program of contributory social insurance for soldiers during the war. Called War Risk Insurance, it was a voluntary and contributory system modeled on workmen's compensation schemes. Specifically, it was designed to address the problem of soldiers' lack of insurability in the private market. Soldiers paid low premiums to the government during the war on insurance for death or disability. They were allowed to convert their war insurance into whole life policies with private insurance after the war. In creating this program, its sponsors sought to substitute insurance payments for postwar claims to death, disability, and pension benefits. In actuarial tables, the insurance program charted the cost to the government of war. It was an insurance system based on quantifiable losses—so much per arm, so much per leg, so much for death, so much per widow and orphan. Other programs for the treatment and rehabilitation of wounded and disabled veterans, reeducation, and reemployment were seen as marginal to the centerpiece of social insurance.

While the war lasted, War Risk Insurance remained the major program to deal with the problems of returning veterans. By war's end, however, political pressure to reward American doughboys (World War servicemen) with some monetary compensation for wartime service led Congress to pass an act granting \$60 additional

World War I veterans in a workshop (*Library of Congress*)

compensation for their wartime losses. High inflation and escalating unemployment after the war added to the soldiers' grievances. Politicians, veterans' advocates, and the veterans themselves sought government aid in adjusting to civilian life. Part of their efforts were directed toward expanding the power and budget of the VETERANS BUREAU and construction and maintenance of hospitals and rehabilitation programs for disabled veterans, originally under the Public Health Service. At the same time, veterans' advocates sought more generous benefits for the average veteran.

Under pressure from its members, a newly created organization for World War veterans, the American Legion, developed a plan for "adjusted compensation" (the SOLDIERS' BONUS) in 1919. They, too, had quantifiable measures for what was appropriate compensation for military service. The legion calculated what the nation owed ex-soldiers from the loss of wages while in service. Civilian workers and corporations had made good wages and profits during the war, and veterans had been effectively cut out

of the war boom. Now was the time, the legion argued, to make good on the nation's obligation to its heroes, those who lost economic ground while patriotically serving their country. Against political reluctance to increase the national debt and the feat of inflation, the legion designed a long-term payment plan, with interest, as its final selling point. Predictability—for nation and citizen—was the keystone of the program; so, too, was universality. Payments to ex-soldiers were to be distributed on the basis of so-called rational criteria for eligibility. After two unsuccessful attempts, Congress in 1924 finally passed the Soldiers' Adjusted compensation Act, or Soldiers' Bonus, over the presidential veto of CALVIN COOLIDGE.

Over the next two decades, the Bonus remained a contentious issue in American political life. Veterans' groups lobbied for a liberalization of the Bonus system. In the face of worsening economic circumstances in the late 1920s and 1930s, they fought for veterans to be able to borrow money from their Bonus and for it to be paid early. As both a measure to benefit worthy veterans and infuse money into a

depressed economy, the Bonus became a universal solution to social ills.

In this period, the American Legion remained ambivalent to its role in veterans' politics. Because it competed for influence with the Veterans of Foreign Wars and other patriotic groups, it was inclined to downplay its role in the Bonus fight. Its leaders, beginning with Legion commander Hanford McNider, were less than enthusiastic about the Bonus, which was principally a rank-and-file demand. The legion leadership preferred lobbying for a conservative political agenda in foreign policy, military PREPAREDNESS, and labor relations. Immediately after the war, conservative legion posts had joined the ranks of police and state militia in suppressing strikes. Legionnaires contributed to raids on labor organizations and street violence against American radicals in 1919–20. The legion's role in foreign policy was to voice demands for greater military preparedness and higher levels of defense spending, as well as an aggressive presence for the United States in its own spheres of influence.

By the 1930s, veterans had discovered their own diversity. Membership in the American Legion had reached a saturation point, and most war veterans did not belong. The Bonus March of 1932 demonstrated that veterans could make radical demands of their government, and the depths of the Great Depression would reveal that many veterans were willing to join the labor movement that the American Legion leadership had so vigorously opposed. While veterans' organizations, from the legion to the VFW and the Disabled American Veterans (DAV), continued to lobby for expanded veterans' benefits, they represented only a militant minority of veterans in American political life.

## Veterans Bureau

Created by Congress under the so-called Sweet Act of 1921, the Veterans Bureau had as its responsibility the oversight of the system of health care and benefits for VETERANS of the armed forces in WORLD WAR I. In particular, the United States faced the return of many veterans who were disabled or in need of vocational training and placement or health care. The new Veterans Bureau had a central office in Washington, D.C., and 14 regional offices. President WARREN G. HARDING, under pressure to address the needs of veterans, appointed a social acquaintance, Colonel Charles Forbes, as director of the bureau. Harding viewed Forbes as “a fine, outstanding man” who had performed

“constructive service” and had a “brilliant record.” Harding and his wife, Florence, hoped that Forbes would provide needed leadership for the “boys” who had returned from France disabled or in need of long-term medical care and disability pensions.

As soon as he was in office, Forbes sought to expand his area of authority. He arranged to have veterans' hospitals and supply depots, which had previously been under the supervision of the U.S. Public Health Service in the Department of the Treasury, transferred to the Veterans Bureau. At that point, Forbes, without the knowledge of the Executive Branch, proceeded to contract for new buildings, sell surplus supplies, and acquire land for hospitals through private hands. In each case, Forbes was able to make a profit by private bidding for public construction contracts. To private firms, he sold surplus food, clothing, sheets, towels, medical supplies, drugs, alcohol, and even floor wax at incredible discounts while he paid obscenely high prices for hospital land and new supplies. When Harding found that Forbes had sold nearly \$3 million in government surplus for a modest \$600,000, Harding quietly fired him. By that time, Forbes had already stolen a fortune from the government coffers. By modest estimates, he and his friends had appropriated over \$200 million (\$33 million by Forbes alone) from a Veterans Bureau that in the aftermath of the war was one of the best-funded and most loosely supervised arms of the federal government.

When President Harding died unexpectedly of a heart attack in 1923, his administration came under congressional scrutiny. The granting of oil leases, which came to be known as TEAPOT DOME, corruption in the Justice Department, and the Veterans Bureau scandal surfaced in Senate testimony. The story gradually unfolded of how Elias H. Mortimer, an agent for a construction company, had bribed Forbes through loans and direct payments to grant his firm government contracts. Forbes had become fast friends with Mortimer and his wife Kathryn, but it was the affair blossoming between Forbes and Mortimer's wife that led to revelations of widespread graft and corruption. Not only through government construction contracts and land deals, but also through the Veterans Bureau's procurement system, millions of dollars had been siphoned from the hospital budget. On the testimony of Mortimer, Charles Forbes and one of his coconspirators, J. W. Thompson, a construction contractor, were sentenced to two years in prison for their part in raiding the treasury of the Veterans Bureau. Forbes alone served his term, as Thompson died in the interim. None of the money was recovered.

Despite the publicity surrounding the Harding administration, the REPUBLICAN PARTY did not suffer any electoral losses in the subsequent election, an outcome shaped by the distance of CALVIN COOLIDGE, who succeeded Harding after his death, from the scandals. At the same time,

the scandal probably left many veterans with an embittered view of the government's role in providing for its citizen-soldiers. It may have contributed to the continued push for a Soldiers' Bonus. The Soldiers' Adjusted Compensation Act finally passed over Coolidge's presidential veto in 1924.

In ensuing years, the Veterans Bureau was presided over by Brigadier General Frank T. Himes, who kept himself and the Veterans Bureau free from scandal. He continued to improve and bolster Veterans Hospitals, vocational training, and rehabilitation efforts through the period. At a time when the federal government retrenched from wartime expansion, the Veterans Bureau grew and broadened its functions, and the cost of veterans' benefits soared. From 1918 to 1941, the cost of services and benefits paid to World War I ex-servicemen, including disability, insurance allotments, and health care costs, equaled \$14 billion, which represented 11.8 percent of government expenditures.

### Volstead Act (1919)

The Volstead Act, also known as the National Prohibition Act, was named after its Minnesota representative, Andrew J. Volstead. It provided the foundation for the enforcement of the Eighteenth Amendment to the constitution of the United States. PROHIBITION was the product of a nearly century-long crusade against alcohol. Countless men and women represented the temperance cause, but none more than the Anti-Saloon League's principal agent, Wayne Wheeler, who supported the amendment, which prohibited the sale, manufacture, and transportation of alcoholic beverages.

On December 18, 1917, Congress approved an amendment to prohibit the production, distribution, and sale of alcohol. The act was passed over the veto of President Woodrow Wilson. The president believed that the act's definition of intoxicating beverages—any beverage containing more than 0.5 percent alcohol—was too strict. Wilson believed in the mission of the amendment, but he had his reservations about placing such a strict definition of alcoholic spirits. He was in favor of a law that allowed for the casual use of weaker wines and ales. His veto proved to be nothing more than a symbolic gesture.

Overriding the president's veto was the first step toward amending the Constitution. The next step was winning approval in the states. At first it was believed to be a daunting task. But upon further assessment, it was not as difficult a task as once predicted. The Women's Christian Temperance Union, the Anti-Saloon League, and dozens of other organizations had been developing the local networks necessary to win support in the states. Twenty-five states

already had dry laws. Prohibition forces received a boost when Detroit became the first large city to support the amendment. State by state, the amendment was ratified. On January 15, 1919, New Hampshire became the 36th state to ratify the amendment. One year later, on January 20, 1920, the law took effect.

The Volstead Act provided the federal and state governments with concurrent power to enforce the Prohibition Amendment, but also created a number of problems with enforcement. The states looked to the federal government to provide for the enforcement, while the federal government believed that it was the responsibility of local authorities to enforce the ban on intoxicants. The problem became even more apparent when states and localities began to openly flout the law. As the law became increasingly less popular, few were willing to devote the resources necessary to wage war on liquor traffickers.

In addition to difficulties with enforcement, the unpopular amendment had a number of other challenges that it was forced to overcome. The most apparent was the scale and scope of the venture. The goal of the Volstead Act, national Prohibition, was arguably one of the most aggressive ventures ever attempted by the U.S. government. In the name of social development, the amendment destroyed private property. It devastated entire industries. It allowed the federal government to legislate what the individual could do in his or her own home. In fundamentally altered the relationship between citizens and their government. All of these concepts, often considered to be alien to American law, were justified by the premise that they were necessary to ensure a more moral society. Its proponents believed that it could and would usher in an era of enlightenment. Other factors soon arose to challenge the idea of national Prohibition. Bootlegging and the crimes associated with the sale and delivery of illicit spirits soon seemed to be more of a threat than the alcohol itself. The most salient factor in the repeal of Prohibition, however, was the global economic crisis of the 1930s.

The amendment's lofty expectations hindered its chances for success. The fact that many of its proponents promised an end to the pain and suffering attributed to drink made it virtually impossible for the amendment to live up to the expectations. As a result, what seemed to be impossible in 1919 took place. This groundbreaking amendment created the opportunity for an even more revolutionary amendment. It opened the door for the Twenty-first Amendment to the Constitution of the United States.

In February of 1933, Congress proposed the Twenty-first Amendment, better known as the Repeal Amendment, to repeal Prohibition. On December 5, 1933, Utah became the 36th state to ratify the amendment. It put an end to the great social experiment.

—Steve Freund

**Vorse, Mary Heaton** (1874–1966) *labor activist, writer*

Writer, journalist, and labor activist Mary Heaton Vorse was born into a prosperous family in New York City in 1874. She originally wanted to become an artist; but after brief stints at art schools in Paris and New York, Vorse chose instead to take up writing. In 1898 Mary Heaton married would-be novelist Albert Vorse, with whom she had two children. The Vorses made their way into the “Bohemian” social world of GREENWICH VILLAGE. Among such writers as JOHN REED, Eugene O’Neill, Hutchins Hapgood, Max Eastman, Susan Glaspell, and Neith Boyce, Vorse was exposed to radical political and cultural ideas. Vorse also belonged to Heterodoxy, a circle of feminist activists, including Glaspell, Crystal Eastman, and Ida Rauh, Max Eastman’s wife. Vorse’s home in Provincetown on Cape Cod became a center of cultural and political activity, and the Provincetown Players, made up of much of the Greenwich Village group, began staging productions during summers on the Cape.

After her husband, Albert, died in 1910, Vorse became the sole provider for her family. She began to churn out what she derisively called “lollipops,” that is, short stories and nonfiction articles, for mass circulation magazines, most of them directed at women. While she wrote for a mass audience as her means of living, Vorse’s real passion became political activism and the writing she did in the cause of the peace movement and the working class. She was one of the editors of *THE MASSES*, and her articles on child labor, housing, and infant health raised public awareness on issues that were the mainstay of Progressive reform. The LAWRENCE STRIKE of 1912 gave Vorse her start as a labor journalist. Seeing, for the first time, the poverty and terrible working conditions of immigrant workers in the textile industry, Vorse saw her goal as supporting the labor movement by telling the stories of workers. It was a commitment she took seriously for more than 40 years and one which shaped both her personal and political lives.

In 1912, Vorse met and married radical journalist Joseph O’Brien. The couple had a child together, but O’Brien died three years later. Vorse spent most of the rest of her life as an engaged and committed journalist, with many friendships but few intimate ones. The causes of

her time absorbed most of her energies. Engaged in the PEACE MOVEMENT, she joined the Women’s Peace Party. During WORLD WAR I, she worked as a war correspondent in Europe and later toured the continent for refugee and children’s war relief. Vorse organized workers in the shirt industry briefly in the 1920s and reported major strikes, including the STEEL STRIKE OF 1919, the GASTONIA STRIKE in 1929, and Harlan County mine strike in 1932. Vorse also contributed to the fledgling labor news service, the Federated Press.

Constantly on the move, Vorse spent the tumultuous years of the 1930s covering the lives of ordinary workers and labor conflicts. The vibrant labor press of the next two decades gave her a growing audience of working-class and union readers. In her work for the Federated Press and in mainstream journals, Vorse captured the demand for social justice in the Great Depression, the hopelessness of the unemployed, the buoyant revival of unionism during the economic crisis, and the shock of the Memorial Day massacre during the Little Steel strike in Chicago, where she herself was injured. Vorse further documented the rise of industrial unionism in automobile, rubber, and steel in the rousing account *Labor’s New Millions*. The book focused in particular on the role of women, families, and communities in helping to build a new labor movement. Vorse continued to cover the labor movement for mainstream journals and the labor press throughout the 1940s and 1950s.

During her lifetime, Mary Heaton Vorse published 18 books and more than 400 articles; she pioneered in writing about working-class lives, whether native-born or immigrant, for a mass national audience through her investigative journalism, documentary accounts, and fiction, and she stirred public support for the struggles of ordinary workers for more than 40 years. She died in 1966.

**Wald, Lillian** (1867–1940) *public health activist, social reformer*

Lillian Wald, an important social reformer of the 20th century, was born in 1867 in Cincinnati, Ohio. After attending elite schools, she enrolled at the New York Hospital Training School for Nurses. Graduating in 1891, she then took classes at medical school while working as a nurse in New York City. Wald pioneered in the practice of home nursing to the poor. It was in this capacity that she gained firsthand experience with the city's poor tenement residents.

In 1893, Lillian Wald and a colleague moved to New York City's Lower East Side to be closer to the residents for whom they were caring. By 1895, with the philanthropic support of Jacob H. Schiff, Wald established a larger settlement, the Nurse's Settlement. Known as the Henry Street Settlement, it expanded its services to include educational training and youth clubs. Wald's brainchild developed into a prominent social service agency in New York City. She introduced the city to a public school nursing program. In 1909, she also persuaded the Metropolitan Life Insurance Company to provide nursing services as a benefit to its industrial policyholders.

Wald's accomplishments were not limited to New York City. Her nursing experience in New York City provided her with the background to establish a new profession, PUBLIC HEALTH nursing. In 1912, she became the first president of the National Organization for Public Health. Through her social service activity, Wald, along with other Progressive Era women, contributed to the development of the SOCIAL WORK profession.

A contemporary of JANE ADDAMS, Wald was active in the pacifist movement and in progressive politics for the Democrats. Like other progressive women, her political activity often revolved around advocacy for the poor and for children. In large measure because of Wald's initiatives, in 1912 Congress established the U.S. CHILDREN'S BUREAU, a division of the Labor Department designed to oversee child labor issues. Labor struggles drew Wald

into the NATIONAL WOMEN'S TRADE UNION LEAGUE, which was a group of reform-minded upper- and middle-class women. They initially made a name for themselves in the SHIRTWAIST MAKERS STRIKE of 1909, where they lent their moral, legal, and financial support to thousands of working-class garment workers. Wald also participated in the founding of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE.

Wald ran the Henry Street Settlement House until 1933, when her poor health forced her into retirement. She died in Connecticut in 1940. Wald exemplified many threads of Progressive Era activism. She never married and drew her emotional support from the women around her. She became an advocate for women's new professions and became active in women's causes. Wald is remembered for helping to professionalize, and thus to some extent legitimize, the predominantly female fields of nursing and social work.

## War Industries Board

The War Industries Board (WIB), a regulatory agency set up to manage the economy during WORLD WAR I, had more powers than any other government agency in the United States to that date. In practice, however, the board did not become a centralized regulatory agency that rationalized the economy. Instead, the WIB became a partner with businesses to coordinate the production and distribution of war materials in the American economy.

The WIB was established in July 1917 to coordinate government purchases of war materials. After months of ineffectiveness, President WOODROW WILSON reorganized it in March 1918 and appointed Wall Street financier

BERNARD BARUCH as its chairman. Under the leadership of Baruch, the WIB extended its reach over much of the American economy. Dominated by industrialists, the board included representatives of major economic interests in the United States.

The WIB matched the demands of war production with the needs of the armed forces, the European allies, other war organizations, and consumers. In some cases, the board persuaded corporations to cooperate voluntarily to meet the priorities of war production. The WIB established 57 committees, which were organized by commodities. The Commodity Committees negotiated for the U.S. government with the War Service Committees, or trade associations, which represented the suppliers. The committees shared information that would assist companies in planning for war production.

Despite its regulatory powers, the WIB did not come to embody the state control of the economy that some Progressives had been advocating in the early 20th century. First, mismanagement and inefficiency plagued the board. Second, the power of the federal government over corporations was limited. The government was dependent on business cooperation to support the war effort. In addition, the federal government needed the skills and knowledge of business leaders to manage production and distribution in the American economy.

The experience of the WIB illustrated to many leaders of government and industry that a cooperative relationship between the public and private sectors was beneficial to both. In fact, Baruch saw himself as a partner with business. The WIB sought to promote the private powers of business rather than restrict them or limit business profits. For many business leaders, profits came before patriotism in their decision making. In fact, major corporations earned huge profits with the help of the WIB.

The Great War had already ended by the time war production peaked under the coordination of the WIB. Immediately after the war, the government dismantled the regulatory structures that had been set up to manage the economy. President Wilson ordered the WIB to end its activities at the start of 1919. Even though the powers of the WIB had been limited during World War I, it served as a model for the National Recovery Administration, an early New Deal agency set up to facilitate an economic recovery during the Great Depression.

### War Revenue Act (1917)

Anticipating the costs of American participation in WORLD WAR I, Treasury Secretary William McAdoo predicted that the U.S. government would need billions of dollars for the war effort. Progressive and conservatives sharply disagreed on how to pay for the war. Specifically, they, like McAdoo, addressed the problem of the ratio of war taxes to war loans. Progressives believed that the war offered an opportunity to solidify a system of progressive taxation based on ability to pay. The Revenue Act of 1916 and the passage of the Sixteenth Amendment for a FEDERAL INCOME TAX had opened the door to taxation as a means to redistribute income. Further, progressives envisioned that paying for the war effort through current taxes was more rational and efficient than long-term war debts. These taxes were to be imposed on incomes, estates, luxury goods, and excess profits. Among conservatives, especially in the business community, loans, not taxes, were the better option. Business interests offered their own variations on what taxes would be imposed. Some suggested a war profits tax, which would have been borne disproportionately by agriculture and manufacturing sectors, which had experienced recessions before the war. Other conservatives preferred to fund the war on consumption taxes alone, though taxing consumption was regressive and punitive.

For the most part, the principles of progressive taxation won out in the War Revenue Act of 1917. While the Liberty Loan and the War Revenue bills were introduced into Congress at the same time, it took six months for the War Revenue Act to make it into law. The act put into force an excess profits tax, raised both individual and corporate income taxes to 4 percent and 6 percent, respectively, and raised excise and estate taxes. New taxes on services, facilities, and on luxury goods such as automobiles were part of the broad-based revenue act. It also increased the maximum surtax on incomes to 63 percent. The 1918 Revenue Act further increased the tax on the highest incomes to 77 percent.

One of the major casualties of the new excise taxes was independent journalism. At a time when inflation had already boosted the costs of publishing newspapers, the introduction of new excise taxes in the form of higher postal rates costs skyrocketed. Already before the war, newspapers had folded under the pressures of escalating costs of new printing machines and linotype metal. Now, along with the soaring price of newsprint, newspapers saw declining profits. The consolidation of newspapers before the war continued due to these new pressures, and hundreds of journals and newspapers either merged with other companies or closed their doors.

The War Revenue Act changed the shape of American taxation and government finance. It shifted the tax burden from customs and excise taxes to taxes on income, profits,

and estates, which were at least marginally progressive. During the war, federal tax receipts escalated more than five times, and they never returned to the lower levels of the prewar years. The federal debt also became a permanent part of American political discourse, as government indebtedness increased during the war years from \$1 billion in 1915 to over \$20 billion in 1920. The cry for tax relief, however, was never far behind, and tax cuts formed a major part of the REPUBLICAN PARTY platform in the elections of the 1920s.

### Washington Conference on Naval Disarmament (1921–1922)

With the Senate's rejection of the LEAGUE OF NATIONS, the United States was isolated in world affairs. The question for its leaders was how to protect the economic interests of the country without committing the nation to an active international role. After Secretary of State CHARLES EVANS HUGHES succeeded in persuading Congress to ratify a treaty in 1921 to formally end the war with Germany, WARREN G. HARDING looked for a way to ensure world peace and stability without limiting American freedom to act in world affairs. Hughes also attempted to prevent a costly naval arms race between the United States, Britain, and Japan. The Washington Conference on Naval Disarmament of 1921–22 provided a way to achieve that end. At the conference, Hughes surprised the delegates by outlining drastic reductions in the naval fleets of all three nations as well as a 10-year moratorium on the construction of large battleships. He proposed to scrap two million tons of shipping that already existed.

To the surprise of Hughes, the delegates actually agreed to most of the terms of his proposal. The Five-Power Pact of February 1922 established limits for total naval tonnage and a ratio of armaments for each of the nations. For every 5 tons of American and British warships, Japan was allowed 3 tons and France and Italy 1.75 tons.

Two other treaties also came out of the Washington Conference. The Nine-Power Pact pledged the five naval powers, plus other nations with interests in the Pacific (Belgium, China, the Netherlands, and Portugal), to maintain the OPEN DOOR POLICY of protecting the territorial integrity of China and keeping equal commercial access in the region. Meanwhile, the countries (the United States, Brit-

ain, France, and Japan) pledged in the Four-Power Pact to cooperate to prevent aggression and to maintain the status quo of each nation's territories in the Pacific. In the event that one of the countries was unable to resolve a conflict in the Pacific diplomatically, the four signatories agreed to invite the other countries to a conference to resolve the dispute.

If the signatories abided by the treaties, the pacts would effectively end the arms race in capital ships, but they did temporarily halt Anglo-American competition and reduced Japanese-American conflict in the region. The treaties sanctioned Japanese dominance in the Pacific. Yet compared to the latitude allowed the United States and Britain internationally, the pacts reinforced the military inferiority of Japan.

A majority of American naval officers opposed the pacts. Naval officers criticized the Five-Power Pact, because it did not produce parity with Britain. The Royal Navy would maintain superiority in large warships in the 1920s. In addition, Britain and the United States did not scrap all the large ships that were covered under the pacts. Instead they converted some of them to carriers. Consequently, the 10-year moratorium was an empty promise.

Nevertheless, Hughes lobbied for the treaties, saying that the Five-Power Treaty "ends, absolutely ends, the race in the competition of naval armaments." The Senate approved the treaties by a large majority even though some senators viewed the pacts as only a first step toward disarmament. For example, Senator Borah wanted the abolition of submarines and parity between France and Japan in capital ships, but that kind of parity would have greatly disturbed the British and derailed the major powers' acceptance of the treaties. Most Americans approved of the treaties of the Washington Conference of 1921. The American press generally praised the treaties. In addition, most businessmen supported disarmament, seeing government reductions in military spending as a way to bring domestic tax relief.

### Watson, Thomas Edward (1856–1922) politician, publisher

Agrarian reformer and populist politician Thomas E. Watson was born in Columbia County near Thomson, Georgia, the son of John Smith Watson and Anna Eliza Maddox. He attended Mercer University in Macon, Georgia. Following his sophomore year, Watson left Mercer

and returned to Thomson, where he privately studied law. In 1875, he obtained his law license and embarked on a career as a criminal lawyer. On October 9, 1878, Watson married Georgia Durham, with whom he had seven children.

By the 1880s, Watson had not only established himself as a successful criminal lawyer, but also was becoming increasingly involved in Georgia politics. Former Confederates Alexander H. Stephens and Robert Toombs were his political mentors. Entering Georgia politics as a Democrat, he was an agrarian reformer steeped in the traditions of the nostalgic Old South, and hostile to the order of things in the post-Reconstruction New South. A new spirit of enterprise had entered into southern life, and many southerners were calling for greater northern investment in the region. Watson often attacked Henry W. Grady, editor of the *Atlanta Constitution*, for his advocacy of the New South ideology. He also blamed northern bankers and industrialists for the failure of southern family farms and spoke out against the Georgia DEMOCRATIC PARTY, which was dominated by capitalist-industrialists (Bourbons). Watson's fiery populist rhetoric helped him win election to a seat in the Georgia Assembly.

In the state assembly, Watson continued his attacks on Georgia Bourbons and their cooperation with northern banking and industrial interests. In 1890, he won election to the U.S. House of Representatives. Although a member of the Democratic Party, Watson supported the Farmers Alliance platform. By 1892, politically active members of the alliance movement formed the People's Party. Watson eventually left the Democrats and joined the Populists.

Once in Congress, Watson introduced many agrarian reform bills, supported the growth of labor unions, and won passage of legislation bringing free mail delivery to rural areas. In 1892, his district had been gerrymandered, and he was defeated for reelection. Watson also lost a controversial election to a Democratic opponent in 1894. Despite these electoral setbacks, he continued to denounce bankers, the trusts, and the policies of the Bourbon Democrats.

In 1896, the People's Party endorsed the Democratic presidential candidate William J. Bryan. However, they nominated Watson for the vice presidency on a fusion ticket. The Republican candidate William McKinley won the election. The defeat of the Democratic-Populist fusion ticket was a bitter and humiliating experience for Watson. He retired from public life and turned to writing popular history and biography.

Watson returned to national politics in 1904. He gained 117,183 votes as the Populist candidate for president that year. In 1905, he founded *Tom Watson's Magazine*, which featured his reform editorials. He made a final, symbolic run at the presidency as a populist in 1908. He died in 1922.

## welfare capitalism

In an effort to combat the bitter labor strife and high worker turnover of the early 20th century, many employers offered new incentives to workers. They hoped that by providing workers with new benefits, they could gain greater productivity, higher profits, and worker loyalty. Collectively referred to as welfare capitalism, these incentives did not end labor-management strife, but they did offer improved working conditions and standards of living for some workers.

By 1910, employers were seeking a solution to the problem of labor turnover. Most workers, feeling underpaid and overworked, exhibited little loyalty to their employers. They left a job as soon as another, better job appeared. In addition, the continued militancy of the labor movement frightened employers. To combat both problems, employers tried to make their firms more appealing to workers. Many employers realized that turnover and worker unrest arose out of the conflict between modern industrial work and human nature. They therefore sought to socialize—or engineer—a modern workforce that accepted its place in industrial society. They did so by offering welfare programs that tried to meet workers' intellectual, creative, and recreational needs. Some programs were directed at making the workplace more pleasant while others focused on the hours after work. A small number of firms also offered financial incentives for hard work.

To meet worker needs, employers created a myriad of programs. On the job improvements such as showers, lunchrooms, and more work breaks softened some of the harshness of factory labor. Employers also tried to heighten workers' dependence on the company by extending their company into the hours after work. Employers who provided company houses, such as those in many southern mill towns, sponsored house beautification contests in an effort to build workers' attachment to the mill village. Other employers created baseball teams in the hope of fostering company pride and loyalty. English-language classes and civics classes also were used to train loyal workers. To skilled workers, the most prized sector of the workforce, many companies offered pension plans and profit sharing in efforts to convince workers to stay with the same company. The Ford Motor Company simply offered its workers more money than any other company paid with its "Five Dollar Day."

Employers offered two basic explanations for their embrace of welfare capitalism. Some stated that they wanted to humanize business and end the war between labor and capital. They would do so by showing that capitalism was not as exploitive as many workers argued. Most employers were straightforward, however, in stating their justification for the programs. Elbert Gary, head of U.S. STEEL, stated that the purpose behind his company's programs was to make sure that his employees had it a little better than workers represented by a union. The head of International Harvester also frankly stated that his programs were developed strictly for business reasons. If workers were happier, then they would show up to work more often and work harder.

Because employers intended to use the welfare programs to create compliant workers, some of the programs became oppressive. HENRY FORD accompanied his pay raise, for example, with strict rules for eligibility of employees, and, to make sure that his employees met the criteria of cleanliness and wholesomeness, his "sociological department" investigated workers at home to see how they lived. If the company found the workers wanting in their morality or cleanliness, they might fire them or take away the Five Dollar wage. Many immigrants took advantage of English-language and citizenship classes offered or sponsored by employers. After all, learning English could help them get a better job. The classes, however, focused on more than simple language and civics. Some taught immigrant workers to be loyal to their employers, criticized unions, and discouraged ties to old-world cultures. International Harvester provided English-language instruction in which the first lesson began: "I hear the whistle. I must hurry." As a consequence, immigrant workers who took the free English-language courses faced an assault on their way of life.

Many workers took advantage of employers' welfare programs, and many enjoyed the benefits. Welfare capitalism did not, however, end the problems of worker turnover and labor-management conflict. Workers recognized the purpose behind welfare capitalism. They often resented the intervention of their employers into their nonwork lives and contended that softball teams and company picnics were not a substitute for higher wages. Many workers who attended English classes, went to the company picnics and played on the sports teams on company time, but attended labor union meetings on their own time. Welfare capitalism as an attempt at socially engineering a compliant workforce failed, and by the 1920s many companies had abandoned their welfare programs.

**Wells-Barnett, Ida B.** See VOLUME VI.

## Western Federation of Miners

Miners from local unions in Idaho, Colorado, Montana, and South Dakota founded the Western Federation of Miners (WFM), a radical labor union, in Butte, Montana, on May 19, 1893. Their purpose was to provide a network of mutual support for miners and smelter workers in the Rocky Mountain region. Many of the miners involved in the creation of the union had participated in the labor dispute at the Coeur d'Alenes mine in Idaho the previous year. That strike resulted in the deaths of three union members and the U.S. Army's arrest of more than 600 union members, more than half of whom were imprisoned for a week without trial.

The WFM claimed its first victory in Colorado in 1894, after a five-month strike in protest against the Cripple Creek mine owners' decision to increase the length of the working day and reduce wages. The strike, which had been punctuated by sporadic outbreaks of violence, concluded when the owners agreed to revert to the eight-hour day and increase the miners' daily wage to three dollars.

Two years later, the union embarked on a short-lived affiliation with the AMERICAN FEDERATION OF LABOR (AFL). The WFM left the AFL in 1897 when it failed to obtain the federation's support for its strike in Leadville, Colorado. A broader reason for the split was the AFL's emphasis on craft unionism, a method of organization that grouped skilled workers according to trade and that effectively discriminated against semiskilled and unskilled workers. The WFM envisioned organizing workers on an industrywide basis. The following year, its leaders formed the Western Labor Union (WLU) as a substitute for the AFL. The WLU stressed the principles of industrial unionism and sought to organize all workers across the American West. In 1901, it changed its name to the American Labor Union (ALU) to reflect those values.

The WFM continued to bring a confrontational approach to its strikes. In Arizona in 1903, a clash between hard-rock miners and their employers prompted President Theodore Roosevelt to dispatch federal troops to the state. He withdrew them when the two parties reached a settlement shortly afterward. In 1904 a strike at Cripple Creek, Colorado, turned violent when an explosion at the Finley mine's rail depot killed several nonunion strikebreakers. Company officials, who claimed that the union was responsible for the explosion, embarked on a violent rampage in which they murdered union leaders, destroyed union property, and deported union members to neighboring states.

In the same period, WFM organizers made their first foray into the Lake Superior region. At the end of 1903, the union's nationwide membership stood at 30,000, a number

that the organizers hoped to increase significantly. Their efforts to organize the copper mines in Michigan between 1903 and 1906 were generally unsuccessful. Joy Pollard, one the union's radical leaders, succeeded in establishing a local branch of the union in Laurium, Michigan, in January 1904, but it struggled to survive. The local refused to engage in a dialogue with mine operators, did not receive enough funding from national headquarters, and did not actively try to recruit non-English-speaking miners.

The leadership of the WFM, including Secretary-Treasurer WILLIAM HAYWOOD played a pivotal role in the creation of the INDUSTRIAL WORKERS OF THE WORLD (IWW) in Chicago in 1905. The WFM was briefly affiliated with the new revolutionary labor organization, but IWW leaders' insistence that the WFM was too conservative caused the alliance to disintegrate in 1908. The same year, the WFM renewed its efforts to organize miners in the Lake Superior district, without much more success than before. While it succeeded in creating additional locals and boosting its overall membership, it struggled to convince miners that they shared similar goals. This was attributable to the fact that wage and skill levels varied widely across the region. Despite the obstacles it faced in the Lake Superior region, by 1910 the WFM had 45,000 members in 177 locals across the United States and parts of Canada.

The WFM recognized that the support of a broader labor organization was vital to its success and thus realigned itself with the AFL in 1911. Two years later, the union finally established a strong union presence in the Lake Superior copper mines. They achieved this by employing immigrant organizers who were able to appeal to the vast array of ethnic groups present in the region. Their success led to major industrial action in Michigan's Upper Peninsula.

In July 1913 the miners went on strike to protest the Calumet and Hecla Copper Company's replacement of the two-man drill with the one-man drill as part of a plan to reduce operating costs. The one-man drill reduced the size of the workforce and made working conditions more dangerous for those who remained. The miners also had grievances against the company's low wages determined by the distance they tunneled into the mine, its long working hours, and exploitation of young boys in mining operations. The copper strike continued into the following year and finally ended in April. Its conclusion did not bring victory to the WFM. Union members' realization that they might be on strike indefinitely, combined with leaders' realization that the strike was draining union funds, forced the miners back to work. By this time, the population of Calumet had already begun to decline, and the union's failure to win recognition for their grievances further weakened the position of organized labor in the mining industry.

In 1918, the union changed its name to the International Union of Mine, Mill and Smelter Workers. It

would, however, take more than a decade for the union to rebound in numbers and influence, coming of age with the rise of the Congress of Industrial Organizations in the 1930s.

### **Wilson, Thomas Woodrow** (1856–1924) 28th U.S. president

The 28th president of the United States, Thomas Woodrow Wilson, was described as a “professor-politician.” Born in Virginia just prior to the Civil War, on December 28, 1856, he was raised in Georgia and the Carolinas, the son of a Presbyterian minister, in an atmosphere of austere piety. Remembered for both his oratorical skills and his idealism, he appealed to the “sovereign people” when legislators threatened his agenda. He was known to be impatient with those whom he felt were unable to understand his reforms. Unwilling to bend, Wilson was considered by some to be cold and unyielding at times and incapable of the compromises necessary in politics.

Despite an apparent dyslexia, which prevented him from learning to read until the age of 10, Wilson developed a heightened interest in literature and politics as a boy. He attended Davidson College near Charlotte, North Carolina, for a year before entering Princeton University in 1875. He studied law after graduation at the University of Virginia. Two years of practicing law, however, was enough to prompt him to leave law and continue his graduate studies in history and government at Johns Hopkins University. In 1886 he received his Ph.D., the only president to earn that degree. He taught history and political science at Bryn Mawr College, Wesleyan University, and finally at Princeton.

In 1885, Wilson married Ellen Louise Axson, the daughter of a Presbyterian minister from Georgia. He had three daughters—Margaret, Jessie, and Eleanor. Although Ellen suffered from depression, their marriage was said to be happy. Ellen's death in August 1914 devastated Wilson until he met and married his second wife, Edith Bolling Galt, in December 1915.

Wilson's rise to political power was meteoric. In 1909 he was the president of Princeton University, where he was known for progressive programs and innovations that attracted the attention of the DEMOCRATIC PARTY. They helped elect him governor of New Jersey. Known for fighting political corruption, he was picked out for the presidential nomination in 1912. A fractious split in the REPUBLICAN PARTY between THEODORE ROOSEVELT and WILLIAM HOWARD TAFT gave Wilson the opportunity he needed. A split party ensured Wilson's success in the presidential election as well as a Democratic victory in Congress. These victories created an environment for reform.

Wilson's domestic policies focused on social and economic reforms. The NEW FREEDOM, Wilson's platform in the 1912 election, included legislation concerning tariff reform, currency reform, and child labor laws, and was the basis of the early success of his presidency. The Wilson administration's first attack on the domestic front was on the tariffs, the banks, and the trusts, known as the "triple wall of privilege." Wilson personally presented his appeal to Congress for the UNDERWOOD-SIMMONS TARIFF bill. This bill provided for a large reduction in rates and import fees. He moved the Congress sufficiently to have the bill pass. A related measure, instituting the new graduated income tax, also was enacted.

Sweeping reform of the banking system was the second area of interest. Again Wilson appealed to the sovereign people and won. In 1913 he signed the FEDERAL RESERVE ACT. It created the new Federal Reserve Board, which controlled 12 regional reserve districts, each with a central bank. It also issued Federal Reserve notes backed by paper money, thus controlling the amount of currency. Trusts were targeted with the FEDERAL TRADE COMMISSION ACT of 1914. This commission focused on monopolies and tried to prevent unfair trade practices. It furthered the antitrust policies of Roosevelt and Taft. Other progressive measures put forth included the FEDERAL FARM LOAN ACT of 1916, making credit available to farmers at low interest rates; the WORKMEN'S COMPENSATION ACT of 1916 for federal civil service employees; and the ADAMSON ACT of 1916, which established an eight-hour day for railroad workers. In contrast, Wilson ignored race relations and demands for civil rights, as he presided over a new, segregated federal bureaucracy.

The Wilson administration inherited troubles in Mexico. Throughout his presidency, Wilson wavered between a policy of "watchful waiting" and armed intervention in the affairs of Mexico. He tried to maintain good relations, but raids conducted by Pancho Villa, kidnappings of American government officials, and threats of an alliance with Germany made this policy hard to keep.

In foreign policy, Wilson is perhaps best remembered for his vision of a "New World Order in the Four-

Thomas Woodrow Wilson (*Library of Congress*)

teen Points." A man of peace, Wilson charted a course of NEUTRALITY for the United States during the first years of WORLD WAR I. From 1914 to 1917, he successfully kept the country neutral by maintaining trading rights with Britain while not provoking Germany. In the 1916 election, Wilson ran on the slogan, "he kept us out of war," and defeated Supreme Court Justice CHARLES EVANS HUGHES. During the neutrality policy, Wilson continually strove to put an end to the fighting and called on all to accept "peace without victory." Germany's acceleration of unrestricted submarine warfare in 1917 left Wilson with no choice but to go to Congress with a declaration of war on April 2, 1917.

The military policy of the United States at this point was shaped by the desire to exert American influence after the war. Wilson rebuffed attempts to limit American participation or place troops under European command. European commanders allowed the AMERICAN EXPEDITIONARY FORCE (AEF) to function under the command of the general, JOHN PERSHING. At home, Wilson directed the mobilization of resources and he continued to work for an end to the fighting during mobilization. The American Expeditionary Force made vital contributions to the Allied effort. When the United States entered the war, France was on the verge of collapse. Within 18 months, the Germans agreed to an armistice due to the AEF's intervention.

Wilson became a leading figure at the Paris peace negotiations that established the postwar order in Europe. As the first president of the United States to leave the country while in office, he departed for France on December 4, 1918. He arrived in France as a hero, but he was unable to convince the other three Allies—Italy (Orlando), France (Clemenceau), and Britain (Lloyd George)—to accept his vision of peace. France especially was determined to keep Germany weak through loss of territory and payment of reparations. Wilson did manage to prevent or delay some of the more extreme provisions. He convinced the Allies as well of the necessity of the LEAGUE OF NATIONS, and with this returned home.

Once in the United States, Wilson was unable to convince Congress to accept the TREATY OF VERSAILLES. Led by Republican and old-time rival, Senator HENRY CABOT LODGE, the opposition argued against the League of Nations, calling it a “sewing circle.” Wilson refused to make concessions and again went to the American people with his ideas. He toured the country giving speeches until his health failed and his tour stopped abruptly. He lost the vote in Congress, and the Versailles Treaty was not ratified. For the rest of his administration, Wilson was an invalid. Even after his second term ended in 1921, he did not regain his physical capacities. He died on February 3, 1924.

The legacy of Wilson’s administration is vast. Three amendments to the Constitution were passed during his presidency. The Seventeenth Amendment provided for DIRECT ELECTION OF SENATORS, a move toward increased democratization. The Eighteenth Amendment prohibited the manufacture, sale, or transportation of intoxicating liquors. The Nineteenth Amendment granted women the right to vote. Other successes included the Federal Reserve Act, the CLAYTON ANTITRUST ACT, the KEATING-OWEN ACT, and the Adamson Act. In foreign policy, Wilson’s vision of the League of Nations, the precursor to the United Nations, and his influence on the TREATY OF VERSAILLES, remained paramount.

### woman suffrage

At the beginning of the 20th century, the woman suffrage movement, founded at women’s rights conventions in the 1840s and 1850s, reached a watershed. The generation of pioneer leaders, including such notable suffragists Elizabeth Cady Stanton, Lucy Stone, and Sojourner Truth, had passed from the scene. Susan B. Anthony, considered

by many suffragists as “the mother of us all,” resigned as president of the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION (NAWSA), having reached her 80th birthday. In 1900, women had the right to vote only in four western states (Wyoming, Utah, Colorado, and Idaho). Lacking financial support, with a small and dispersed membership, disorganized leaders, and facing a long dry spell in suffrage activity, NAWSA elected Anthony’s handpicked protégée, CARRIE CHAPMAN CATT, as its next president.

In the next two decades, Catt had an enormous impact on reorganizing and revitalizing the suffrage at both the federal level and in the states. As NAWSA president from 1900 to 1905 and again from 1916 to 1920, Catt recruited prestigious members of society (Catt’s “society plan”) to the suffrage ranks and, in doing so, established the credibility and respectability of the suffrage cause. Further, NAWSA was able to fill its empty coffers with the funds gained from new converts. By shepherding its resources and focusing on winnable state-level campaigns, NAWSA was able to overcome the long gap between suffrage victories and gain the vote for women in Washington State in 1910 and in California the following year. In each campaign, precinct-level organization, and the coalition among progressive reformers, proved crucial.

Suffrage supporters faced strong opposition from organized ANTI-SUFFRAGISTS, due to widespread beliefs about women’s traditional role, but the public often had other fears. Giving women the right to vote radically expanded the electorate, and it was, along with other democratic reforms, controversial in the magnitude of its action. Since the late 19th century, anti-suffrage leagues brought together those who wanted to restrict the ballot with those who reacted against women entering public life. Yet, by 1910, the “society plan” had given new respectability and new resources to the struggle for woman suffrage. Catt’s choice of a more consciously political strategy to educate public opinion and mobilize citizens in favor of women’s right to vote brought NAWSA a wave of new members. As a matter of expediency, she also downplayed the historic role of racial equality in the struggle for women’s rights. Some suffragists argued for literacy tests for voters and for women to have admission to whites-only primaries in the segregated South, among other ways of restricting the vote. Catt, however, did not accept the southern states’ rights strategy that would have rejected a federal amendment entirely. African-American women, for the most part, organized their own suffrage organizations when faced with these segregationist sentiments. Support for woman suffrage was, on the whole, stronger in the black community than among whites. But while suffragists conflicted with each other in such key areas as organizing among wage-earning women, racial equality, states’ rights, and the importance of a federal

amendment, the woman suffrage movement rapidly gained ground under Catt's plan.

By the 1910s, Catt's deliberate organization and the seeming incompetence of then NAWSA president, Anna Howard Shaw, made younger women impatient. Working with such leaders as Alice Stone Blackwell and HARRIOT STANTON BLATCH, the daughters of suffrage pioneers, a younger generation of suffragists mobilized in support of women's right to vote through independent means and organizations. The College Equal Suffrage League, the Equality League of Self-Supporting Women, and Political Equality Association, among many others, began to shift interests away from the gradualism advocated by NAWSA into more militant tactics and publicity-minded campaigns. Blatch and others created new forms of protest, borrowing from other social movement traditions, and inaugurated suffrage parades and motorcades and street corner debates.

The most important of these efforts came originally under the wing of NAWSA, when it formed its Congressional Committee to pursue the question of a federal woman suffrage amendment. Led by ALICE PAUL, the committee soon left NAWSA's ranks to form the Congressional Union (CU), reorganized as the NATIONAL WOMAN'S PARTY in 1916. What the Congressional Union attempted to do was to redirect the efforts and resources of the woman suffrage movement away from state-by-state campaigns toward the passage and ratification of what came to be called the Anthony Amendment, in honor of the great suffragist. State campaigns had exhausted the energies of an entire generation, and yet by 1914 women could vote in only a handful of states. By working toward a federal amendment, long the ambition of both Anthony and Stanton, women would be granted the vote not by separate state campaigns but in one sweeping piece of legislation.

The tactics of the young radical suffragists extended the pressure tactics of public lobby and petition campaigns to hold the party in office responsible. They sought to make a politician's failure to support woman suffrage costly. Borrowing heavily from British suffragist Emmeline Pankhurst's Women's Political Union, the Congressional Union adopted militant protest as its hallmark. In 1917 it developed the Silent Sentinel campaign to picket the White House nonstop until then-president WOODROW WILSON agreed to support woman suffrage. When women were arrested in the course of picketing, CU members, following the lead of British suffragists, went on hunger strikes to arouse public sympathy.

In 1915, after a 10-year hiatus, Carrie Chapman Catt once again became president of NAWSA. She returned with a campaign of her own design, the "Winning Plan" for a federal amendment. Catt offered the suffrage movement a centralized, efficient, and partisan means of achieving

the goal of woman suffrage. To stop wasting time on endless state-level campaigns, NAWSA was now to join ranks with those who proposed and supported a federal amendment granting women the right to vote. Rather than spend time petitioning and lobbying countless state legislatures, NAWSA, through its Congressional Committee, was to take on the job of persuading a majority of congressmen and senators to shift their votes toward woman suffrage. As part of the move to focus all energies on the federal Anthony amendment, Catt also centralized decision making in the hands of the Executive Board, which she appointed. Catt's goal was to "keep the suffrage noise up" all around the country in order to ensure the ultimate victory for women's vote. She was vastly helped by money from the widow of publisher Frank Leslie, who willed her estate to NAWSA to fund suffrage work.

During WORLD WAR I, woman suffragists faced a central dilemma. They were divided not only on issues of strategy and tactics, but also about the war itself. When the United States entered the war in 1917, there were many suffragists who opposed the war, both due to their pacifism and also because they viewed America's participation as wrong. For Alice Paul and the National Woman's Party, the war was irrelevant to the goal of winning the vote for women, an attitude for which they were widely condemned. A founding member of the Woman's Peace Party, Carrie Chapman Catt set aside her pacifism with a pragmatic understanding that opposition to the war effort would only undermine the case for woman suffrage. She served during the war on the Woman's Committee on National Defense, which coordinated women's volunteer work in support of the war.

In 1918, women's support for American participation in the war persuaded some politicians to end their opposition to woman suffrage and vote for the federal amendment. Supported now by President Wilson, what became the Nineteenth Amendment to the Constitution, which granted women the right to vote, passed the House of Representatives. The Senate, after voting it down in 1918, passed the federal amendment in 1919. NAWSA, the National Woman's Party, and other suffrage organizations now swung into action in the ratification campaign. Tennessee became the 36th state to ratify the Nineteenth Amendment in August of 1920, and woman suffrage was finally a reality throughout the United States.

### Women's International League for Peace and Freedom (WILPF)

In the midst of WORLD WAR I, female suffragists primarily from Europe and the United States met in The Hague, Netherlands, to discuss prospects for world peace and expanding women's rights. The seeds that were planted in 1915 came to fruition in 1919 when the Women's International League for Peace and Freedom was created. WILPF was an early proponent of marrying suffrage and post-suffrage activism to issues of world peace. Its founders believed that only in a world without war and injustice could people be truly free. WILPF's first international president was JANE ADDAMS, a well-known American progressive activist and founder of Hull-House. In 1931, she became the first American woman to win the Nobel Peace Prize.

WILPF's philosophy reflected the progressive emphasis on social justice and exemplified the moral grounds on which women entered male politics in the Progressive Era. The organization was influenced by the belief that war and other forms of violence could be prevented if politics and government had more women representatives and if society adopted more "feminine" characteristics. Women possessed certain traits, such as cooperativeness, that most WILPF women claimed would counteract male competitiveness and violence. Although the group's philosophy corresponded to what most Americans believed about women, its political affiliation was often questioned. During the RED SCARE, WILPF's antimilitarism was sometimes viewed as unpatriotic, causing some of its critics, including Secretary of War John D. Weeks, to label it "red." Other critics, however, opposed female suffrage and female political activism and, therefore, rebaited the organization in order to discredit it and undermine its appeal. Despite the attacks, WILPF's appeal grew. With 2,000 members in 1921, the American section grew to 13,000 by 1937.

During its early years, WILPF dedicated itself to three main issues: internationalism, disarmament, and antimilitarism. WILPF supported the efforts of the LEAGUE OF NATIONS and other international institutions in their attempts at international disarmament and diplomatic cooperation. Through these campaigns, the women of WILPF demonstrated their belief in their own power as women to influence nations and leaders in foreign policy decision making. In 1926, WILPF sent a delegation to Haiti to investigate the effects of the American occupation. In the late 1920s, the organization petitioned American politicians to withdraw from Nicaragua. WILPF represen-

tatives, including Jane Addams, lobbied President CALVIN COOLIDGE to support the KELLOGG-BRIAND TREATY, a treaty proposing that countries renounce war.

A major tenet of the organization's agenda was the establishment of an international network of women. To that end, WILPF sent a delegation to Indochina and China in 1927. WILPF women maintained that if women in nations around the world pressured their governments, then war could be prevented. Although WILPF enjoyed considerable success as far as having access to influential politicians, particularly in the United States, its goal of averting war was not an international priority in the 1930s, as most Western economies fell into a depression, prompting governments to focus on economic strategies. Disarmament, an issue that most Western nations pursued in theory in the 1920s, was abandoned in practice as countries could not enforce its provisions in the 1930s. The 1932 disarmament conference in Geneva included female delegates for the first time, including WILPF's Mary Woolley in the American delegation. Diplomatic crises in Asia and President Hoover's lukewarm support for the conference revealed that international cooperation on disarmament was taking a backseat to other issues. WILPF, nonetheless, continued to focus on disarmament throughout the decade.

### women's status and rights

Women's struggle for greater political rights and higher social status came to a peak in the years between 1900 and 1920. In 1900, only a few American states granted women the right to vote. Few women practiced law, due to long-standing exclusions from law schools and the bar. A host of other laws and customs kept women from full equality. Protective labor legislation kept them from night work and prescribed their hours of work. By the 1920s, some feminists came to view these laws as barriers to women's equality. During the first 20 years of the 20th century, women poured their energy into gaining the vote and other political rights. Volunteer organizations laid the groundwork for women's intense civic engagement. At the same time, the WOMAN SUFFRAGE movement faced a new challenge from feminism, an ideology of equality between the sexes that went from the single-minded pursuit of the vote into broader issues of women's equality.

In the years between 1900 and 1930, women in the United States were faced with inequality in every area of social, political, and economic life. As the 20th century began, they lacked the vote, could not serve on juries, and did not, for the most part, have the right to run for elected office. School suffrage in some states had opened the door for women to run for school superintendent, but apart from this position, they did not serve in government. In social life, married women continued to be subordinate to their husbands, and most took his name at marriage. They had no easy access to birth control. They had only recently received the right to own property, have custody of their children, and retain their own wages. In practice, few women had control over how family money was spent.

In the workplace, women faced discrimination and even exclusion from certain occupations and lacked the political clout or the union organization to fight back. While female labor force participation slowly rose from 1900 to 1930, most women continued to hold low-wage semiskilled jobs and often had only seasonal employment. There was little job security and even less opportunity for promotion. For married women, who constituted only a small proportion of the labor force, there was even less opportunity, as

employers often refused to hire married or older women by preference. Family work also kept married women from regular employment, and those who needed income had to take in sewing, laundry, or boarders.

The poverty, poor working conditions, and uncertainty of working women's lives prompted many to organize. For working-class women, it most often meant turning to the labor movement, but middle- and upper-class women also were aware of working women's plight and turned toward new forms of organization. In 1903, settlement house workers, trade unionists, and reformers met to form the NATIONAL WOMEN'S TRADE UNION LEAGUE (NWTUL). Based on a British model of cross-class alliance, the NWTUL urged women workers to organize unions and informed the public about their needs. Like the National Consumers' League, the NWTUL supported maximum hour and minimum wage laws and even local ordinances that required stores to have seats for women workers. The General Federation of Women's Clubs, originally organized as a forum for women's educational and social needs, evolved a new agenda of legislation to improve workplace conditions and require new safety standards, such as barring the manufacture of phosphorous matches. Suffrage

Suffragists marching in New York City, 1913 (Library of Congress)

organizations also developed new approaches to mobilizing women for the vote, and they began to work with working-class women in suffrage campaigns.

The commitment to women's equality was evident in the work of CHARLOTTE PERKINS GILMAN. A follower of progressive sociologist Lester Ward, Gilman believed in social evolution, social progress, and equality of opportunity between the sexes. As a result of her 1898 work, *Women and Economics*, Gilman became the leading intellectual of the women's movement in the United States during the early 20th century. In *Women and Economics*, Gilman spoke of the high cost to society and individual women of their isolation in the home and exclusion from the world of paid work. She urged women to move out of home occupations into arenas previously dominated by men.

By the turn of the century, the struggle for women's equality generated a new BIRTH CONTROL movement to combat state and federal laws against the distribution of birth control information or devices. Radicals EMMA GOLDMAN, MARGARET SANGER, and Mary Ware Dennett challenged conventional respectability and the law in speaking publicly about sex and contraception. They urged women to exercise their sexual freedom and control their reproductive capacity free from state interference. Without birth control, women were prevented from achieving full economic status and rights in their sexual freedom.

Sanger's work in promoting birth control brought her into the public spotlight. Her work as a practical nurse had brought her to understand the lack of control women had over their own bodies. The public relations strategy she used deepened public awareness and challenged laws that suppressed the free circulation of contraceptive information. She published a journal, *The Woman Rebel*, beginning in 1914, and a pamphlet, *Family Limitation*, which gave advice to women about various birth control methods. In 1916 Sanger opened the first birth control clinic in Brooklyn, New York. New York State law specified in Section 1142 that no one could give information to prevent conception to anyone for any reason. Sanger and two of the clinic's staff members were arrested for violating the law. While she fled to Europe to evade prosecution and later returned to a successful public acquittal, Sanger changed her emphasis by 1919 from women's control of their own bodies to eugenic reasoning about better babies.

The struggle for women's equality inspired women's activism in an ever-broadening range of causes. The prime obstacle, however, was women's lack of voting rights. When CARRIE CHAPMAN CATT, head of the NATIONAL AMERICAN WOMAN SUFFRAGE ASSOCIATION, publicly argued "Why Women Want to Vote" in early 1915, the first of her reasons was justice, and the second was that voting was the duty of women citizens. Society, Catt believed, needed women's skills and labor in schooling, dealing with unem-

ployment, and caring for the indigent. An important aspect of her argument was its blend of the two schools of feminist thought. Catt argued both for women's "sameness" (their similarity to men) and their "difference" as reasons to grant women the same political capacities as men.

The struggle for women's equality took a turn for the better when, in 1920, the required number of states ratified the Nineteenth Amendment to the Constitution, which gave women the right to vote. Although many people thought the need for the women's movement ended with its passage, women still faced many enormous obstacles in their pursuit of equal rights. ALICE PAUL was a leader in seeking to pull down the obstacles to women's equality. She believed that women's rights would be won only through ongoing struggle. Even though the vote advanced the cause of women's equality, it did not satisfy them. As leader of the NATIONAL WOMAN'S PARTY, Paul took the next step by drafting the EQUAL RIGHTS AMENDMENT (ERA) to the Constitution. This amendment, she argued, would guarantee that men and women would have uniform, equal rights throughout the United States. The proposed amendment generated immediate response, most of it negative, from many former suffragists. They also had fought for protective labor legislation for women workers, and they saw the ERA as a threat to these protections. In support of the ERA, Suzanne La Follette in her book, *Concerning Women*, argued against protective legislation for women. She believed labor laws that applied only to women allowed employers to discriminate against them. For women to have equal opportunity for industrial employment, labor standards must apply equally to men and women. La Follette believed full economic independence and personal autonomy would be achieved only through true sex equality.

Women advocates now moved in different and sometimes opposing directions. In 1919, Carrie Chapman Catt proposed that the enormous National American Woman Suffrage Association reconfigure itself as the League of Women Voters. Its agenda focused on three main areas: equal legal status for women, efficiency in public welfare, and international peace through cooperation. Catt's preference was for women to remain aloof from partisan commitments and independent from party politics.

Many agreed that woman suffrage was an outstanding victory, but they felt that the great expectations held for it were not realized and claimed that there were few female candidates for elective office. Still, despite the failure of women to vote as a bloc or even in sufficient numbers, many aspects of politics were transformed when women gained the right to vote. Party women insisted on representation in state and national committees, and women began appearing at national political conventions. Women lobbyists and federal agency employees were able to pass the SHEPPARD-TOWNER ACT (1921) and the CABLE ACT (1922), which

granted women access to maternal health programs and equal citizenship after marriage. The agenda of political parties had shifted under the influence of women voters and their organizations.

Women like settlement leader JANE ADDAMS, known for founding Hull-House and the social work movement, turned thus reform convictions to a new direction. Addams believed that, in order for women to have equality, violence in its many forms must be suppressed. In particular, to free women of their inferior status, the possibility of war must be controlled through peace organizations and war itself eventually outlawed. At the outbreak of WORLD WAR I, Addams poured her energy into the peace movement. She helped to found the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM (WILPF).

Addams, like other feminists of her generation, was a target for the postwar anti-radicalism of the RED SCARE. While A. Mitchell Palmer focused on immigrant radicals and militant labor organizers, other politicians viewed women's organizations as a threat. In the 1920s, a spider chart of the red network located Addams as the leader of the WILPF at its center. She was, some claimed, "the pinkest of the pink." The postwar period also gave rise to anti-feminism and a trend toward stifling social conformity in the relations between the sexes. Opponents of women's equality used a conservative defense and sought to constrict women's sphere to the domestic realm through appeals to scripture and contemporary social scientific theories, which placed emphasis on physical differences between men and women. Practitioners of psychology found common ground with conservative thinkers by opposing the gains of women. They used the theories of SIGMUND FREUD to bolster beliefs in the biologically determined and divinely sanctioned subordination of women. Sexologists turned to HAVELOCK ELLIS for a new celebration of heterosexual marriage. Their psychobiological approach claimed that "biology is destiny" for women. In contrast, new studies by anthropologist MARGARET MEAD downplayed sexual differences and argued for a much greater range of gender identity and sexual practice.

The 1920s and the 1930s saw a group consciousness among minority women. This generated a new energy toward the gain in women's status and rights. The long-standing NATIONAL ASSOCIATION OF COLORED WOMEN focused its agenda on confronting racial oppression. It also continued to unite black clubwomen across the United States, who had the "double task" of struggling for race oppression and sex emancipation.

The struggle for women's rights went through a period of scrutiny at the end of the 1920s. Some saw feminism as outdated, since women had the vote. Others believed things had gone too far and claimed the pursuit of sexual equality was destructive to society. The indisputable legacy

of the postwar debate was its understanding of the paradox of how to be a human being and a woman too.

## work, household

The period between 1900 and 1930 showed a marked change in the way that household labor was organized and performed, especially among urban families. The changes were threefold: improvement in municipal sanitation, water supply, and heat and light; changes in domestic technology, including the introduction of household appliances such as the refrigerator, the washing machine, and electric or gas stoves; and the decline of live-in domestic servants among the middle class, which increased the domestic work of women. Food provision and preparation already had changed with the increasing use of commercial bakeries, the widespread production and use of canned goods, chain grocery stores, and electrical appliances for the preparation of food. Ready-made clothing began to be more widely available in the 1880s, especially for men; by 1900, new styles of DRESS, including the introduction of the shirtwaist and the increased availability of children's clothing, reduced the amount of sewing done in the home. The purchasing of groceries, clothing, and household items further changed as chain food and department stores and new forms of urban and suburban transport, including the automobile, made possible the use of downtown shopping districts and centralized stores rather than neighborhood shops. These changes also shifted the burden of obtaining household goods almost entirely to women.

Improvements in access to and quality of public utilities changed the daily routine of urban women doing household work. Fetching water from public pumps, long a major and dreaded chore for women and children, was no longer necessary in an era of running tap water and water closets. Indoor plumbing throughout the house, including heated water, however, led to a demand for cleaner kitchens and bathrooms. Gas and then electric lighting became widespread in urban areas; so, too, did oil and gas furnaces for heating and gas ranges for food preparation. By 1930, nearly 50 percent of households did their cooking with

From a young age girls were trained for the housework that was expected of them when they matured. (*Library of Congress*)

gas. The price of electric energy and appliances dropped significantly, so that more than one-third of all residences were wired for electricity by 1920. During the ensuing decade, electric washing machines, vacuum cleaners, sewing machines, and reliable refrigerators became cheaper and more available. Electric toasters, cake mixers, irons, and food grinders were more popular. Among rural households there were fewer changes, especially due to the lack of a rural electrical supply. It would not be until the 1930s that farmsteads saw the widespread adoption of household appliances and indoor plumbing.

The overall impact of these developments was to alter the division of labor within the household and shift the burden even more heavily onto women. Indoor plumbing and gas stoves removed the need to fetch water and chop wood or shovel coal, but these tasks had normally been shared among household members. In contrast, the addition of new appliances for cooking and cleaning, such as the power vacuum and the partially mechanized washing machine, caused household work to multiply. Height-

ened standards of cleanliness, abetted by fears of infection and enhanced by the hard sell of ADVERTISING, steadily increased the number of meals cooked, clothes washed, and rooms cleaned.

Further, child care remained the responsibility of women in the household, even as children spent less time at home. Public EDUCATION, including new kindergarten programs and compulsory schooling laws, removed children from the care of their parents and siblings for long hours, and new high schools offered adolescents extended schooling and time outside the family. These changes meant that older children were no longer available to supervise younger siblings. Further, new forms of RECREATION, especially those designed for YOUTH, and continued patterns of employment among young adults meant less help with household chores. At the same time, there were increased expectations for women within motherhood. Hysteria about the new sexual behavior of Jazz Age youth gave rise to the criticism that the NEW WOMAN was a poor parent. Spending time with younger children, and

devoting increased time to keeping a clean and well-regulated household, increased women's household labor and lengthened their domestic work day.

### workers' compensation

In the Progressive Era, workers' compensation was the name for any payment workers received to cover the cost of treating workplace injuries and lost wages. Its provision varied according to different states, and it did not extend to occupational diseases and illnesses. At the turn of the century, workers who suffered physical injuries as a result of industrial accidents rarely received any form of payment from employers. To successfully win any claim, injured workers had to prove that the accident was the result of employer negligence, but the lack of evidence after the fact, combined with the power of large corporations, made this a difficult task. Similarly, if families of workers killed on the job wanted to claim compensation, they had to provide evidence that showed the culpability of the employer. Employers rarely had to accept liability for workplace injuries and deaths. Even if a worker or bereaved family successfully won compensation, the amount of money they received was fairly small and usually not enough to cover lost earnings and medical and/or funeral expenses. The compensation system in the United States differed from Great Britain, where the government had introduced comprehensive laws in 1897.

Despite the inadequacy of the compensation system, workers found alternative support mechanisms. In the MINING INDUSTRY, the WESTERN FEDERATION OF MINERS (WFM), the largest mining union in the western states, provided care and support for sick and injured members. This included treatment at one of the union's own hospitals and access to its health and disability programs. The WFM's measures were more than just a system of support for the miners. They were also a strategy of opposition toward employers who evaded the responsibility of providing adequate health care and compensation. Aside from such programs, millions of other workers offset the costs of injury or death by joining life insurance programs.

Labor leaders and some lawyers, unwilling to accept the status quo, pressed for more extensive protective labor

laws, such as an adequate worker compensation system, while state governments conducted studies with the intention of stemming the rising number of industrial deaths and injuries. Judges contributed to the debate over workers' compensation by advocating a system of employer liability based on the law of torts. Developed by the judiciary after the Civil War, the law of torts stipulated that a person was entitled to compensation if he or she was the victim of an act of injustice.

The year 1907 marked a turning point in the struggle of those seeking better compensation laws. On Georgia Day, at the Jamestown Exposition, President THEODORE ROOSEVELT acknowledged that industrialization was exacting a growing toll in industrial injuries and diseases and proposed an overhaul of the nation's work laws. Roosevelt asserted that all workers involved in industrial accidents should be entitled to compensation, so long as the injury was directly attributable to their work. He envisioned a compensation program financed by employers, which would eradicate the need for costly litigation and encourage employers to exercise more care. In an effort to set an example, Roosevelt's government established a compensation program for federal employees in 1908. Roosevelt still believed, however, that the federal government should not interfere with the states' rights to create their own compensation programs.

Corporate leaders did not completely disagree with Roosevelt's sentiments. They recognized that a more comprehensive compensation system might help to stem escalating unrest among workers. This unrest was particularly acute in the STEEL INDUSTRY, where Andrew Carnegie's vehemently antiunion stance deprived workers of the right to organize. Without a union to address their grievances, injured workers brought lawsuits, refused to work, or engaged in other methods of protest. Carnegie's company, U.S. STEEL, introduced a new compensation program in 1910 called the Voluntary Accident Relief Plan. Although the plan provided substantial compensation payments for injured workers and bereaved families, based on worker contributions, it assigned the blame for accidents to claimants and prevented employees from taking the company to court.

The growing visibility of workplace hazards across all sectors of industry led to the passage of new workers' compensation laws. From 1911 to 1921, the majority of states passed such laws, which guaranteed monetary compensation for injured workers and the families of workers who died as a result of workplace accidents. Employers assumed responsibility for workers' compensation, which motivated them to reduce industrial accident rates. Workplace fatalities and injuries meant monetary losses not only through payments to workers but also through higher insurance premiums. Workers who claimed compensation, however,

automatically relinquished the right to sue their employer. Employers, in an effort to limit the workplace accident rate, created an organization called the National Safety Council in 1913.

There were limits to the compensation laws, as they did not cover workers who developed occupational diseases. Coal miners, for instance, were unable to obtain coverage for a lung disease called pneumoconiosis, otherwise known as black lung, which many of them contracted by spending prolonged periods of time in dust-filled underground mines. Similarly, workers who developed cancers as a result of direct exposure to chemicals found that employers fiercely contested responsibility for their illness. The most significant reason for this discrepancy in the laws was that it was almost impossible to prove the link between workplace hazards and long-term diseases.

The laws remained largely unchanged in the 1920s, although North Carolina and Missouri passed compensation laws during that decade, which left South Carolina, Arkansas, and Mississippi as the only states without a system of workers' compensation. The workers' compensation laws reflected the federal government's reluctance to infringe on the rights of individual state governments, and in that sense, they were very much a product of their time.

### **Workmen's Compensation Act (1916)**

The Kern-McGillicuddy Workmen's Compensation Act of 1916 enabled workers to collect compensation for injuries sustained in the workplace. Prior to the passage of the act, workers alone were deemed responsible for their actions and ensuring their own safety. Following the "fellow-servant rule," employers were not held responsible for injuries sustained as a result of negligence on the part of other employees. Prior to 1900, state and federal courts interpreted this rule to mean that employers were almost never responsible for work-related injuries. As greater num-

bers of employees worked in dangerous industrial workplaces, which were often made even more hazardous by the employer's failure to provide safeguards, the need for effective workmen's compensation increased.

One of the immediate stimuli behind the push for workmen's compensation was the 1911 TRIANGLE SHIRTWAIST FIRE in New York City, which killed 146 female employees. The workers were unable to escape the blaze because exits were either blocked or locked from the outside. The disaster and subsequent acquittal of the company's owners shocked many and convinced reformers and labor leaders of the need for legislative action. In the absence of federal legislation, individual states had begun to enact workmen's compensation legislation. In 1902, Maryland became the first state to pass legislation. By 1910 many others had followed its lead. The organized labor movement was among the first to support state and federal legislation. The AMERICAN FEDERATION OF LABOR began calling for effective workmen's compensation in 1894. Other labor organizations, including the American Association for Labor Legislation (AALL), also supported compensation for injured workers.

By 1916, 35 states had passed workmen's compensation legislation, but the effectiveness of these laws varied greatly. Some state laws, such as the one passed in New Jersey in 1911, were comprehensive and highly effective. Other states, however, had much weaker laws. The problem was complicated by the fact that state laws were consistently challenged and undermined by state judiciaries. Arguing the fellow-servant clause, employers convinced state and federal courts that workmen's compensation legislation violated equal protection under the law and freedom of contract. In 1909, in an important case, *Ives v. South Buffalo Railway Company*, the New York State law was ruled unconstitutional, this time by the state supreme court.

Pressure to pass federal legislation mounted in the aftermath of the Triangle Shirtwaist Fire. Concerned about maintaining the support of organized labor as he prepared for the inevitable entry of the United States into WORLD WAR I, President WOODROW WILSON announced his support for the Kern-McGillicuddy Act in 1916. Drafted by the AALL, the act received widespread support. Wilson signed it into law in 1916. The Workmen's Compensation Act was an important step in improving working conditions and protecting workers. The law was given greater weight in 1917, when in *New York Central Railroad Company v. White*, the Supreme Court finally upheld legislation passed in New York. Nevertheless, the ability of workers to collect compensation for employer negligence remained limited. Employer negligence remained difficult to prove, and many state courts continued to be reluctant to hold employers responsible.

## World War I

The First World War, known at the time as the Great War, was the first war to engage the entire European continent since Napoleon was defeated in 1815. It produced worldwide social and political upheaval. The war involved over 70 million combatants and ended in the death of between nine and 12 million people. By its end, the economy of Europe was devastated and its governments either overthrown or reorganized. After it was over, many hoped that it would be “the war to end all wars.”

Internationally, the period before 1914 was one of heightened tensions between the “Great Powers” and great change. Nationalist movements, strengthened by an increasing awareness of ethnic identity, added to the instability. The Austro-Hungarian and Ottoman Empires struggled to come to grips with their citizens’ desire for self-determination, and an arms race among the nation-states of Germany, Britain, France, and Russia heightened the conflict.

The war had several causes. Great Britain sought to preserve her empire and control of the seas; France fought against German dominance and for return of her lost territories of Alsace and Lorraine. Japan sought to expand its territory as did Italy. China looked for the return of territory lost in the BOXER REBELLION. The Americans entered, belatedly, when the Wilson administration convinced the nation to make the world safe for democracy. The violation of freedom of the seas and the loss of American lives in U-boat attacks stiffened the country’s resolve to join the war.

Europe exploded in the summer of 1914 when a Serb patriot killed the heir to the throne of Austria-Hungary. An outraged Austria, backed by Germany, instantly presented an ultimatum to Serbia. Backed by its Slavic patron, Russia, Serbia refused to concede. The Russian czar mobilized his army, threatening Germany on the east. France, Russia’s ally, confronted Germany on its west. Alarmed, Germany struck at France through Belgium to knock the enemy out of action. Witnessing its coastline threatened by the assault on Belgium, Great Britain entered the fight on France’s side. Overnight, Europe was at war on three fronts—in the Balkans, in Russia (the eastern front), and in France and Belgium (the western front). On one side, there were the Central Powers of Germany, Austria-Hungary, Turkey, and Bulgaria. The Allies of France, Britain, and Russia, and later Japan and Italy, opposed them. The United States remained neutral.

American neutrality did not prevent it from filling British and French war orders, as business boomed. The Central Powers protested American shipments to Britain,

but trade was not against international neutrality laws. Germany was free to trade with the United States as well, but it was prevented from doing so by an effective British naval blockade. The British controlled the sea lanes, and they put a blockade in place across the North Sea, which forced American ships away from German ports. In retaliation for this blockade, Germany quickly instituted a submarine war around the British Isles. German officials declared that they would try to avoid neutral ships, but they warned that, ultimately, mistakes would occur. President Wilson, therefore, had to calculate the importance of free trade and the economic benefits of insisting on neutral trading rights. The loss of American ships endangered American neutrality. Germany declared unlimited warfare on all ships. Submarine warfare ultimately drew the United States irrevocably into the fray. Once the ZIMMERMANN TELEGRAM was discovered and published, there was no going back.

When the war began, the American army numbered only 128,000 men. Due to budget cuts and traditional reliance on state militia, the army was badly in need of arms and equipment. Germany was aware of these factors, and thus discounted America’s entry into the war. This prediction was seemingly confirmed by the isolationist policy of the Wilson administration until Germany’s policy of unrestricted submarine warfare, brought to life by the sinking of ships such as the *LUSITANIA*, gave Wilson no choice but to protect America’s economic and political interests abroad. He declared war on Germany in April 1917.

Instituting the draft in the United States under the SELECTIVE SERVICE ACT, along with the accompanying appropriation bills, prepared the AMERICAN EXPEDITIONARY FORCE for entry into the war. By the end of the war, over four million soldiers, sailors, and Marines had served their country in the war effort. For the first time in the history of the United States, women were allowed to join the armed services. Twenty-four thousand women served in the military during the war as nurses and clerks.

The Wilson administration quickly realized that it needed to mobilize resources to meet the needs of a nation at war. For the first time, the federal government stepped in to regulate all aspects of the country’s industry and life. Wilson established the Food Administration, which advised Americans what and how much they should eat. The FUEL ADMINISTRATION controlled coal, gas, and oil. To fight shortages, they relied on the public’s cooperation and patriotism, rather than on rationing. The NATIONAL WAR LABOR BOARD was another example of government regulation. It worked to prevent labor unrest that interfered with the wartime economy and tried to keep wages in line with needs. The WAR INDUSTRIES BOARD controlled industrial output. It made sure that industrial production met war needs. The WAR REVENUE ACT raised taxes and issued Liberty Bonds to finance the war.

American soldiers manning a firing position behind barbed wire in a trench at Dieffmatten, in Alsace (National Archives)

Many Americans responded with enthusiasm to the patriotic call. The COMMITTEE FOR PUBLIC INFORMATION (CPI), created by President Wilson, raised public support for the war effort through propaganda. War posters urged Americans to join the army. Movie stars, marching bands, and billboards celebrated those who “did their duty.” As flags were waved and bands played farewells, men rushed to volunteer for the war and the American Expeditionary Force. Back at home, citizens sacrificed for their boys. The CPI prompted support for the war partly by playing on fear of German spies and other radicals. The CPI informally censored publications until Congress, with the TRADING WITH THE ENEMY ACT (1917), gave the U.S. Post Office the responsibility of censoring materials that opposed the military draft and the war by denying mailing privileges. Government propaganda and fear turned many Americans against everything German. Many states outlawed the German language, and mobs terrorized many German-American citizens. Both the ESPIONAGE ACT of 1917 and the SEDITION ACT of 1918 reflected the government’s desire to suppress dissent and popular fears of Germans and other antiwar individuals. The government prosecuted antiwar socialists and members of the INDUSTRIAL WORKERS OF THE WORLD (IWW) under these acts. Antiradical prosecutions culminated in the postwar RED SCARE.

Many important social and economic changes came of the war. Massive intervention in industry, the significant but temporary transformation of the role of women, the decline in social deference, and a realignment of class relations were all consequences of the war. There was also, however, a political shift, in the expansion of the state in relation to private citizens. The wartime suspension of individual rights in the military draft and under the Espionage

and Sedition Acts had a tremendous impact on society. In addition, the Wilson administration developed machinery for domestic political surveillance. The Justice Department and military intelligence kept tabs on labor organizers and later unhappy ex-servicemen. Such surveillance demonstrated the increased willingness of government to intervene in the lives of its private citizens.

The Great War marked the end of one era and the beginning of a new age. The military struggle of World War I was but one aspect of a changing world. As a modern war, it involved whole societies in support of the armed forces. Sweeping, irrevocable changes on the home front resulted. In the United States, where resources, labor, and industrial plants were plentiful, corporations used the War Industries Board to promote expansion. European domination of the world economy ended, and the war’s end introduced a new world order. In the United States, influential capitalists sought increasing economic control over resources internationally, especially in Latin America and on the Pacific Rim. They looked to the armed forces to protect their interests.

The human cost of war was, for the first time, expressed through new media. Books, films, poetry, songs, and newspapers depicted the human cost of war and affected an entire generation, but it was not only war that had changed society. The WOMAN SUFFRAGE movement finally won its battle, with passage of the Nineteenth Amendment giving women the right to vote. Sexual norms changed in other ways, as women bobbed their hair, smoked cigarettes openly, and danced freely in public. Overall, women experienced more freedom, as the war had expanded their horizons. Returning servicemen found a social atmosphere quite different from what they had left. There were bootleggers, gangsters, Prohibition, bathtub gin, and jazz. Many returning from overseas relocated in the cities and left the rural areas behind. The popular song that asked “How you gonna keep ’em down on the farm, after they’ve seen Paris” seemed to be true.

The idealism of Wilson, his LEAGUE OF NATIONS, and world peace also were casualties of war. Congress, and in particular HENRY CABOT LODGE, refused to accept the league or ratify the TREATY OF VERSAILLES. As unemployment rose after the war, race relations at home soured, and disillusioned VETERANS returned home and contributed to the social discontent.

**Wright, Frank Lloyd** (1867–1959) *modernist architect*

America's best-known architect, Frank Lloyd Wright, helped create an American style of ARCHITECTURE and ushered in the modern architectural age. He is known for his designs ranging from large office buildings to small houses. His best-known work is the Pennsylvania house known as Fallingwater. Built over a waterfall in 1936, the house is a definitive example of Wright's desire to fit his designs into their surroundings. His other famous designs include the headquarters of the Johnson Wax Company in Racine, Wisconsin, the Unity Temple in Oak Park, Illinois, and the Guggenheim Museum in New York City. Due to a variety of personal developments, Wright never achieved the acclaim during his early career that he did after 1930. He is recognized today, however, as the preeminent American architect whose design style was the first to be applicable to all building types.

Born in Richland Center, Wisconsin, Wright entered the University of Wisconsin at age 15 to study engineering, although he wanted to become an architect. After two semesters, he dropped out and went to work in the architectural studio of Louis Sullivan in Chicago. After six years, he quit Sullivan's firm and opened his own office in the Chicago suburb of Oak Park.

Wright quickly won recognition and hundreds of commissions that allowed him to work out new principles of design. Borrowing from many previous architectural styles, he eventually developed his own unique style that, in the years prior to 1930, he used primarily in the design of houses. He rejected the artificiality and rules of the classical style in favor of designs that combined structure, function, and idea with the inspiration of natural forms. The design that Wright eventually developed revolved around a set of guiding principles. These principles called for the reduction of necessary parts and the number of rooms in order to create a sense of unity throughout the entire house. He also believed that it was vital for a house to fit its surroundings, whether a rectangular lot marked by the street grid or a more natural setting.

Wright's designs eliminated boxlike rooms in favor of wide doorways between rooms that occurred more naturally and he often relied on screens for dividing rooms. His principles also called for the use of straight lines and just one building material in order to make them "clearer and more expressive." His principles went beyond the structure of the house itself. Wright's desire for clarity led him to design ornamentation based on straight lines and rectangular shapes that matched both the natural settings of the house and its materials. He also sought to incorporate furnishings into his architecture by designing them in simple terms along straight lines and in rectangular forms.

Wright's designs became known as prairie-style houses because of their open design and embrace of the open spaces of the Midwest. A group of architects embraced Wright's style and became known as the "Prairie School." Wright's influence in the years before 1930 was tempered, however, by his insistence on individualism and a series of scandals that surrounded him. Because Wright believed that each architect should express his own individualism and creativity in his designs, he never set out to create a school of design. He was, in fact, openly critical of the Prairie School architects. In addition, Wright became unpopular when in 1909 he left his wife and began living with the wife of one of his clients. His personal choices lost him many commissions in the Chicago area. Despite these obstacles to the spread of his ideals, Wright became the most recognized architect in America. He did so because he was the first American architect to develop a set of principles applicable to the complete range of buildings, from small houses to large office buildings, demanded by American society.

**Wright Brothers (Wilbur [1867–1912] and Orville [1871–1948])** *inventors of the airplane*

Wilbur and Orville Wright made the first powered, sustained, and controlled flight with a heavier-than-air flying machine at Kitty Hawk, North Carolina, on December 17, 1903. The AVIATION pioneers grew up in a household led by their father, a bishop in the Church of the United Brethren in Christ, whom they later credited with fostering in them a curiosity about the way things worked. The two brothers never graduated from high school, choosing instead to study mathematics and engineering on their own. In 1889 they launched their first joint venture, a print shop. They also began to publish two short newspapers.

During the 1890s, the Wright brothers sought to use their mechanical skills to supply the booming market for bicycles. Americans were experiencing a bicycle craze triggered by mechanical developments that made them easier to ride. By 1896, the Wrights were building bicycles for sale in their small shop in Dayton, Ohio. Their business was successful, and the brothers used their profits from the sale of bicycles to finance their experiments in flight.

The Wright brothers became interested in flight after reading articles reporting the death of a German aeronautical pioneer in 1896. Between 1899 and 1905, they manufactured seven aircraft, three of which were powered. In

Orville Wright flying a Wright glider at Kill Devil Hills, near Kitty Hawk, North Carolina. The flight was officially the first sustained, controlled flight by a heavier-than-aircraft. Wilbur Wright runs alongside his brother. (Hulton/Archive)

1901, they designed and built their own wind tunnel, which proved crucial to their eventual success. The wind tunnel allowed them to experiment with different wing designs and arches. While doing these tests, they developed the first accurate tables of lift and drag, the parameters that govern flight. From their experiments in the wind tunnel and in actual flights in the gliders they constructed, the Wright brothers developed the proper wing and tail shape to provide stability in flight. They then built an engine to power their aircraft. The aircraft that made the first flight had a wingspan of 40 feet and weighed 750 pounds, with the pilot. The brothers took turns flying it. The longest flight on that first day in 1903 lasted 59 seconds and the plane traveled at 10 mph.

The Wright brothers patented their control system and offered their plane to the U.S. War Department. They did not, however, begin to exhibit their aircraft publicly

until 1908 when they undertook a promotional tour of the United States and Europe. By 1909, they could sustain a flight for 20 miles and governments in the United States and Europe began to order planes. To meet the demand, the Wright brothers formed the Wright Company to manufacture and sell their aircraft.

Wilbur Wright died of typhoid fever in 1912, and Orville sold the Wright Company to investors in 1915. He continued to play an important role in aeronautics. He served as a consulting engineer during WORLD WAR I and became a member of the National Advisory Committee for Aeronautics.

### **Young Men's Christian Association and Young Women's Christian Association (YMCA and YWCA)**

The YMCA and YWCA were established in the mid-19th century by middle-class Protestants in reaction to the movement of both native-born, white rural migrants and alien immigrants into American cities. The reformers who established the associations worried about the moral health of the young men and women migrating to the cities. They feared that the established churches were not equipped to cope with the problems that single young migrants presented. They therefore established YMCAs and YWCAs to help the migrants adapt to urban life. During the first three decades of the 20th century, the YMCA and YWCA expanded their programs in an effort to bring more young men and women through their doors. As its programs became less attractive to young men, the YMCA began to offer recreational programs for YOUTHS, which would eventually become its primary mission.

American cities provided numerous challenges for new migrants. They had to find a job, a place to live, and food. After they took care of all these necessities, then they would seek out leisure-time activities. All of these decisions could present problems for young men and women. The wrong job or place to live could pose dangers to the moral health of the migrants.

Of particular concern to the YMCAs was what the young men did in their leisure time. Because the young migrants had left their families and communities behind they often made these decisions without the guidance of family members. The YMCA sought to step in to help young male migrants adjust to urban life. At the same time, middle-class Protestants feared that if the migrants remained unsupervised, they posed a threat to the social order. If the young men were not taught proper middle-class values and behaviors, they might fall prey to radical political propaganda. The YMCAs created programs, therefore, to both protect the migrants and the social order.

The YWCA's original mission was to protect women from the dangers of the city and to lessen class conflicts by teaching working women middle-class values. The YWCAs sought to provide a moral environment for young women in what the YWCA leaders saw as an immoral urban world. Eventually, the YWCA recognized the economic reality that was at the root of the dangers posed to young women in the industrial order and began to champion reform movements for the betterment of the social and economic conditions in which young working women lived. YWCAs altered their mission to meet the needs of these new migrants to the city. As YWCA workers interacted with young women, they realized that their low wages presented the real problem for single working women and that the threat to the young women's morality lay in what they might do to make ends meet. YWCA workers feared that women might resort to prostitution as the only available means to earning enough money to live on. The YWCA's programs therefore revolved around the dangers presented by the low wages available to women.

To fight this threat, the YWCAs established programs aimed at making it cheaper for these women to live in American cities and also joined reform movements that sought to change women's place in the social, political, and economic order. By creating vocational education classes, for example, the YWCA tried to help women gain skills with which they could earn higher wages. Low-cost lunchrooms provided the women with a decent meal at an inexpensive price. Affordable apartments in a supervised, Christian environment protected women from the dangers of immoral landlords and neighborhoods. Social events attracted women who might otherwise have gone to commercial leisure establishments such as dance halls where they might fall prey to immorality. In addition to these local programs, YWCA workers fought for WOMAN SUFFRAGE, higher wages, women's education, and an end to domestic violence.

Boys using the gymnasium at the YMCA (Library of Congress)

The YMCA's first programs were simple prayer meetings. However, the YMCA realized that its prayer meetings were not attracting the men they wished to save. Therefore, in order to attract young men, the YMCA leaders expanded their program to include leisure activities and living space. The first offerings were libraries and reading rooms. When the associations realized that their new programs were successful, they rapidly expanded. Soon the YMCAs established employment bureaus, classrooms, gymnasiums, pools, bowling alleys, and cafeterias. The purpose behind all these programs was to attract young men so that they would spend their leisure time in a Christian institution instead of commercial leisure places. For the same reason, the YMCAs across the country built large dormitories. YMCA leaders feared that many young men put themselves in moral danger by living in low-priced lodgings. To protect the men, YMCAs offered low-priced lodging in a supervised setting.

The men that the YMCA originally sought to serve lost interest over the years, and the YMCAs had difficulty attracting members. In reaction, YMCAs across the country lowered the age range of their target population. By offering sports leagues and other recreational programs, the YMCAs attracted urban youth. By making this adjust-

ment, the YMCAs maintained a significant presence in urban America.

### youth

Between 1900 and 1930, the modern version of adolescence emerged in America. Today when we think of youth, we picture a time when children are gradually given more responsibility in preparation for their entrance into the adult world, after leaving either high school or college. Most children leave elementary school when aged 11 or 12, enter high school at age 14 or 15, and enter college or the full-time job market at age 18. A range of institutions exists, from juvenile courts to high schools, to help America's youth through these transitions. Youth also live in common cultures partially determined by age. Youth is thus a shared experience among all Americans, differing only by race, class, and gender.

At the turn of the century, the lives of America's youth differed a great deal from one another due to race, class, gender, educational, and regional differences. Growing up was not the normative process that it would become. Some youths went to work before their teenage years, for example, while others stayed in school through college. During the first decades of the 20th century, a number of factors combined to change the paths followed by America's youths as they matured.

Youth is a socially constructed category. The definition of youth has changed over time in reaction to social, cultural, and economic changes in society. During transitional times in American history, society has placed great emphasis on youth. When the social order appears to be threatened, America has turned to its youth as the hope for the future. The first three decades of the 20th century were no exception. American society was dealing with the profound changes stemming from industrialization, urbanization, and immigration. Many feared that the country's youth were threatened by these changes. Large numbers of working-class youth were unable to find jobs that offered a chance for advancement. In addition, the increase in the number of immigrant children in schools and cities frightened reformers, who feared that the immigrant youth would pose a threat to the social order if not properly socialized. Reformers also feared that cities created a dangerous environment for young people. They bemoaned the lost opportunity for youth to experience the green pastures of the country and then started summer camps to expose urban children to the healthier rural atmosphere.

Actions taken by reformers helped construct the modern definition of youth. Efforts to simultaneously protect youths from the evils of industrialization and protect the social order from the poorly socialized youth created new ideas about adolescence. At the core of the conflict about modern youth was the struggle between authorities in defining youth and the actions of youths on their own terms. Society tried to maintain youths' dependence on adults, while youths fought for their independence in a variety of ways.

The creation of the juvenile courts systems highlights this tension. The juvenile courts served both to help youths in trouble and to punish youths for independence from adult authority. Prior to the establishment of juvenile courts, youths who committed a crime went into the adult court system and, if sentenced to jail, served their time in an adult prison. Believing it dangerous to treat youths as adults, reformers established the juvenile court systems in the states. The idea behind the courts was that youthful offenders presented special circumstances. If they were simply placed in adult courts and adult prisons, they would be at risk either of physical harm or of learning criminal behaviors from adults. Reformers therefore sought to sepa-

rate the youths from the adults. Special courts were created in which youths arrested for crimes went before a single judge who was supposedly better prepared to analyze their special circumstances. Judges also had new options available with regard to sentencing. As part of the new juvenile court system, states created youth reformatory or industrial schools as they were called in some states. Instead of sentencing youthful offenders to adult prisons, judges could send them to a child-only reformatory, where the authorities focused on behavioral, educational, and vocational training so that the inmates would be useful members of society upon their release.

The juvenile court system was undoubtedly an improvement over the sentencing of youths in their teen years to adult prisons. The courts were not, however, an unqualified success. The creation of special courts for juveniles led to new definitions of crimes for youths. Adolescents could be arrested for hanging out on the street corner, sexual promiscuity, or other acts of independence from their families. Once in front of the judge, youths often had no recourse to an attorney and did not receive a jury trial. Because the purpose of a sentence in the reformatory was to reform each inmate, sentences were often of indeterminate length, ending only when prison officials decided that an inmate had become reformed. The negatives of the juvenile systems tended to affect working-class and minority youths to a greater extent than middle-class youths because police and the courts often released middle-class youths to their parents instead of sentencing them.

Between 1900 and 1930, the number of American youths working full-time declined tremendously due to changes in industry and society. Reformers feared that factory work threatened the physical and mental health of America's youth. To protect youth from these dangers, reformers passed CHILD LABOR laws and compulsory schooling laws. State legislatures across the United States passed compulsory education laws in reaction to economic changes. By the 20th century, the apprentice system for learning a trade was all but nonexistent. In addition, many of the jobs in new large factories, did not offer opportunities for advancement. Educators feared that the young men and women entering factory work faced a life of toil without the hope of advancing to a better-paid position with better working conditions. Educators also feared that the immigrants streaming into America would never adopt American ways and values if they never received an EDUCATION. To counteract these threats, educators undertook efforts to bring more children into school. Compulsory education laws were the favorite tools in their efforts. Most states passed such laws in the late 19th century and expanded the targeted ages in the early 20th century. By 1910, many states had passed laws that mandated education up to at least 14 years of age. Many of these laws exempted youths

aged 15 and 16 only if they could prove that they could read and write at a satisfactory level.

Changes in the economy also decreased the number of youths working full-time. Mechanization replaced many of the jobs formerly done by child workers. The rise of large industrial corporations and a new tier of management increased the value of a high school education. Large corporations depended on personnel departments for hiring workers, and the newly created personnel departments often set a high school education as the minimum requirement for employment. Corporations also created new clerical jobs that required a high school education.

Compulsory schooling and child labor laws acted to dramatically increase school enrollment. American schools during this period witnessed an increase in the number of students attending school, and particularly high school. Between 1900 and 1930, the proportion of 14- to 17-year-olds enrolled in high school grew from 10.6 percent to 54.9 percent. Total enrollment increased almost 700 percent. The increase in high school enrollment for outstripped the growth of the high school-aged population. The percentage of 17-year-olds who had graduated from high school increased from 6.4 percent in 1900 to 32.1 percent in 1930.

The growth in the high schools had unintended consequences. By placing a greater proportion of teenaged youths together, it led to the creation of youth subcultures centered on the high school. Cultures based on the common experience of high schools were not necessarily new, but the number of youths participating was. Middle-class adolescence, defined by schooling through high school, was becoming democratized. The youth cultures that developed were based on peer interactions and sanctions rather than adult restrictions. New norms of dating behavior emerged, for example, because teenaged women spent greater amounts of time with men of their own age. Dating flourished under this system, because women felt safe to go on dates unchaperoned by adults. Commercial interest also played a role in the creation of youth cultures. As incomes rose for most Americans during the 1920s, youths, and in particular middle-class youths, had more money to spend. Marketers targeted youths and a youth market developed. One important consequence of the development of the youth market was that it gave teens power outside the family. Instead of relying on family consumption decisions, teens decided on their own how to spend money. The development of the teen market slowed during the Great Depression, but rebounded with a bang in the post-World War II era.

The rise of the number of high school students led to an increase in the power of youths to challenge the

roles prescribed to them by society's institutions. There was power in numbers. Youths who challenged the social roles often faced punishment, such as a sentence to a juvenile home or parental sanction. However, as the number of youths sharing common experiences increased, so too did the number of youths mounting challenges to certain restrictions. When a group of youths became powerful enough, they could successfully change their roles. In the 1920s, for example, middle-class teens used their purchasing power to successfully challenge the dependent roles assigned to them. Commercial interests began to market directly to this new group of consumers, bypassing the family. Youths thus gained a powerful ally in their quest for independence.

The rising role of the schools in the lives of America's youths helped to establish age as a basis for social categorization. At the beginning of the century, students in most school districts moved through the school systems at their own pace. Educators, fearing that they were not meeting the needs of many of their students, created high schools that provided a differentiated curriculum designed to prepare each student for their future occupation. The curriculum became the same one offered today, with its separate tracks of vocational and college preparatory classes. Educators discovered, however, that many students were old enough to leave school before reaching high school and the vocational training it offered. In an effort to expose all students to the differentiated curriculum at the high school, educators began to promote students by age, instead of achievement. Age-based education played a key role in establishing age-based norms for growing up.

By the end of the 1920s, American youth went to school more, worked less, had stronger youth cultures, and were more tightly supervised by the state than their parents had been. The unemployment crisis of the 1930s pushed even more youths into high school, because they could not find jobs. The lengthening of adolescence through schooling set the stage for the development of the American teenager as a key consumer in the affluence of the post-World War II period.

### Zimmermann telegram

Henry Lewis Stimson, secretary of war, once remarked that “gentlemen do not read each other’s mail.” This observation did not apply to the Zimmermann telegram of 1917. Arthur Zimmermann was a member of the German Diplomatic Corps since 1908. He had risen to the position of secretary of state for foreign affairs in 1916. During WORLD WAR I, the German government had petitioned the U.S. State Department to use its cable lines to communicate with its foreign missions about President WOODROW WILSON’s mediation proposals. Secretary Zimmermann sent a coded cable via the American embassy in Berlin to the United States. The State Department in Washington, which handed it to the German ambassador, then cabled it to the German embassy in Mexico City.

Unfortunately for the Germans, the British intercepted the cable, deciphered it, and presented it to the Americans. The British government hoped that the message would hasten American involvement in the war. The cable informed the German ambassador in Mexico City that his government planned to resume unrestricted submarine warfare on February 1, 1917. It announced that the German government was repudiating a policy established in the wake of the sinking of RMS *LUSITANIA*. Additionally, the cable further proposed to the Mexican government a Mexican-German alliance in which Mexico was urged to reconquer territory lost to the United States. In the 1840s Mexico had lost land in Texas and California as a result of the Mexican-American War of 1846–48. Kidnappings of American dignitaries and raids by the Mexican leader Pancho Villa had caused tension between the two nations. President Wilson found it difficult to maintain a policy of noninterference, given the upheaval in Mexico.

Wilson finally sent an expedition led by General JOHN PERSHING to locate and kill Pancho Villa. The army did not operate effectively in Mexico, which is one reason that Germany probably felt it could risk war with the United States. The expedition, popularly known as the MEXICAN INVASION, failed to capture Pancho Villa. The American army withdrew in January of 1917. Despite the army’s defeat, Mexican leaders were furious with the U.S. intervention. The Mexican president, Venustiano Carranza, even proposed an alliance to Germany. As the war situation worsened for Germany, it became increasingly interested.

When the deciphered telegram was published on March 1, 1917, it further intensified anti-German feeling in the United States. Shortly after the Zimmermann telegram was made public, German U-boats sank four unarmed American merchant vessels in the first two weeks of March. Wilson lost his gamble that the United States could pursue neutral trade without being brought into the European war.

Those favoring neutrality claimed that the note was a forgery. Zimmermann himself, however, admitted that the telegram was genuine. The publication of the note was central to eliciting public support for the war. Without the telegram the United States might have delayed entering the war; Germany’s decision to once again engage in unrestricted submarine warfare against the British blockade, however, guaranteed that the United States, largely sympathetic to the Allies, would declare war on Germany. The Zimmermann telegram was the catalyst that set the U.S. war effort in motion.

# Chronology

---

## 1900

The Hay-Pauncefote Treaties give the United States exclusive control over the construction and management of any future isthmian canal in Central America.

Madame C. J. Walker begins selling cosmetics and hair treatment systems to African-American women; her business eventually makes her America's first female self-made millionaire.

The first of a series of conservative Christian tracts called *The Fundamentals* is published. The books, which reject a scientific view of the world, particularly the theory of evolution, are enormously popular.

With the Currency Act of 1900, the United States officially returns to the gold standard.

The Foraker Act of 1900 creates a civil government for U.S.-controlled Puerto Rico.

Susan B. Anthony's handpicked successor, Carrie Chapman Catt, becomes president of the National American Woman Suffrage Association.

Harry Houdini begins performing his spectacular escapes.

After the failed antifoiegnier Boxer Rebellion in China, the United States and European powers agree to equal access to the nation's markets with the Open Door Policy.

The General Electric Company creates a lab in Schenectady, New York, devoted exclusively to scientific research. America's first corporate research and development facility, it sees the development of numerous profitable inventions, including the incandescent light bulb, the vacuum tube, and the X-ray machine.

Republican William McKinley is reelected over Democrat William Jennings Bryan.

## 1901

Financier J. P. Morgan buys out Andrew Carnegie and forms U.S. Steel, the world's largest corporation.

The American Medical Association asserts its influence to control entry of doctors to the profession.

The United States forces Cuba to incorporate the Platt Amendment into its 1901 constitution. The measure effectively makes Cuba a vassal state of the United States.

Two socialist parties merge to form the Socialist Party of America under the leadership of Eugene V. Debs.

A huge underground oil deposit is discovered in Beaumont, Texas, starting a boom.

President William McKinley is assassinated by an anarchist at the Pan-American Exposition in Buffalo, New York; Theodore Roosevelt succeeds him.

## 1902

Roosevelt appoints Oliver Wendell Holmes to the U.S. Supreme Court; Holmes remains on the Court for 29 years and constructs the modern theory of civil liberties.

Lincoln Steffens, a leading muckraking journalist, joins the staff of *McChure's Magazine*. As editor, Steffens transforms *McChure's* into the leading political magazine in the country.

Scott Joplin composes the ragtime tune "The Entertainer."

U.S. Congress passes the Chinese Exclusion Act of 1902, which indefinitely suspends Chinese immigration to the United States and prohibits resident Chinese from gaining citizenship.

U.S. forces capture Filipino insurrection leader Emilio Aguinaldo and assert American sovereignty over the Philippines.

United Mine Workers of America organizes an Anthracite Coal Strike that idles 140,000 miners for five months. President Roosevelt intervenes, ultimately reducing the hours and boosting the wages of miners.

U.S. Congress passes the Spooner Act, authorizing U.S. construction of a canal across the Isthmus of Panama.

The United States Public Health Service is created.

**1903**

U.S. intervention prevents the Colombian government from suppressing a revolution in Panama.

Jack London publishes his novel *The Call of the Wild*.

W. E. B. DuBois's *The Souls of Black Folk* is published.

Republican congressman Joseph Gurney Cannon becomes speaker of the House of Representatives; his autocratic reign lasts eight years.

The U.S.-Canadian Convention of 1903 establishes a six-person joint commission to settle a dispute over the boundary between the Alaskan Panhandle and British Columbia.

U.S. Congress passes the Elkins Act of 1903 to prohibit discriminatory railroad rebates.

The Supreme Court upholds the legality of land sales in the Indian Territory in violation of a U.S.-Kiowa treaty. The ruling will serve as a precedent for U.S. violations of treaties with Native Americans for the next five decades.

U.S. secretary of state John Hay and Panamanian minister Philippe Bunau-Varilla negotiate the Hay-Bunau-Varilla Treaty of 1903. The treaty gives the United States the right to build a canal across the Isthmus of Panama and confers on the United States control of the canal for 100 years.

At Kitty Hawk, North Carolina, Orville and Wilbur Wright make the first successful airplane flight.

**1904**

Construction of the Panama Canal begins.

O. Henry's first collection of short stories, *Of Cabbages and Kings*, is published.

Incumbent Republican Theodore Roosevelt wins the presidential election against Democrat Alton B. Parker.

The Roosevelt Corollary modifies the Monroe Doctrine. The corollary states that the United States will intervene in any Latin American country guilty of "chronic wrongdoing."

Muckraking journalist Ida Tarbell publishes *History of the Standard Oil Company*, exposing how John D. Rockefeller had ruthlessly created a monopoly through his company. The book prompts a federal investigation of Standard Oil for antitrust violations.

In *Northern Securities Company v. United States*, the U.S. Supreme Court demands the dissolution of the Northern Securities Company because it violates the Sherman Antitrust Act of 1890. It is the first successful prosecution under the Sherman Act.

**1905**

The Niagara movement is organized to promote political, social, and civil equality for African Americans.

Photographer Alfred Stieglitz founds the 291 gallery in New York City. The gallery helps establish photography as an art form.

The Industrial Workers of the World (IWW) begins organizing semiskilled and unskilled workers regardless of their race, ethnicity, or gender, starting with mineral mine workers in the West.

Ruling counter to its earlier precedent, the U.S. Supreme Court invalidates an 1893 New York State law that regulates the length of the bakery work day in *Lochner v. New York*.

John P. Harris and Harry Davis open the first nickel-odeon in Pittsburgh; patrons can view a movie for five cents.

Using the Roosevelt Corollary, the United States seizes the finances of the Dominican Republic when the country is unable to make payments on its \$22 million debt. The nation's finances will be under U.S. control for the next three decades.

**1906**

President Theodore Roosevelt wins the Nobel Peace Prize for negotiating an end to the Russo-Japanese War of 1904–05.

The Burke Act of 1906 grants to Native Americans full title to their homesteads immediately, eliminating the 25-year trust period previously required.

Upton Sinclair publishes *The Jungle*. Its vivid descriptions of the hideously unsanitary conditions in the meat-packing industry lead to national outrage and a government investigation.

U.S. Congress passes the Pure Food and Drug Act of 1906, which prohibits the manufacture, sale, and transportation of adulterated or fraudulently labeled foods and drugs shipped in foreign or interstate commerce.

The Meat Inspection Act of 1906 gives the U.S. secretary of agriculture the power to inspect meat and label products that are unfit for human consumption.

A rebellion threatens the stability of Cuba; President Roosevelt sends U.S. troops to Cuba, where they remain for three years.

After being accused of covering up the murder of a local white man, all 167 soldiers in an African-American unit stationed in Fort Brown, Texas, are dishonorably discharged.

Prompted by President Theodore Roosevelt, U.S. Congress passes the Antiquities Act, which grants the chief executive authority to proclaim public lands as national monuments.

The Hepburn Act of 1906 gives the Interstate Commerce Commission (ICC) the power to review railroad rate decisions for antitrust violations.

**1907**

The Indian Territory is formally dissolved as Oklahoma becomes a state.

An agreement between the governments of the United States and Japan, the Gentlemen's Agreement of 1907, limits Japanese immigration to the United States.

Florenz Ziegfeld launches *The Follies*, a series of 20 annual and opulent musical revues that capture the popular imagination.

U.S. Congress passes the Expatriation Act of 1907. The act bars the entry of suspected radicals and revokes the citizenship rights of female U.S. citizens who marry foreign nationals.

### 1908

The United States and Japan issue the Root-Takahira Agreement of 1908, pledging to respect each other's territorial possessions in the Pacific and uphold the Open Door Policy in China.

President Roosevelt orders the U.S. Navy's "Great White Fleet" on a world tour to demonstrate American military might.

"The Eight," consisting of Robert Henri and other realist artists, exhibit their work at the MacBeth Galleries. Critics derisively call them the "Ashcan school" of artists.

Jack Johnson knocks out Tommy Burns and becomes the first black heavyweight boxing champion.

In *Muller v. Oregon*, the U.S. Supreme Court upholds a 1903 Oregon law that limits the maximum hours women can work in any factory or laundry.

In *Loewe v. Lawlor*, the U.S. Supreme Court rules that a union boycott constitutes a conspiracy to restrain trade.

Republican William Howard Taft, vice president under Theodore Roosevelt, defeats Democrat William Jennings Bryan in the presidential election.

Henry Ford introduces the Model T Ford automobile, the first car produced by assembly line. The inexpensive car is received with phenomenal popularity.

### 1909

The National Association for the Advancement of Colored People (NAACP) is founded. Black writer W. E. B. DuBois begins editing *Crisis*, the NAACP's journal.

Robert E. Peary of the U.S. Navy becomes the first man to reach the North Pole.

The Payne-Aldrich Tariff Act of 1909 increases the already high duties imposed in the Dingley Tariff Act of 1897; President Taft's support of the bill divides the Republican-controlled Congress.

President Taft sends U.S. troops to Nicaragua to support U.S.-friendly revolutionaries.

The Shirtwaist Makers strike of 1909–10, in which 300,000 garment workers strike 300 sweatshops, galvanizes a broad range of laborers and arouses public sympathy.

### 1910

U.S. Congress passes the Mann Act of 1910 to prohibit interstate transportation of women and girls for "immoral" purposes.

The Mann-Elkins Act of 1910 places the growing telecommunications industry under the jurisdiction of the Interstate Commerce Commission (ICC).

The Mexican Revolution begins: Francisco Madero, Pancho Villa, and Emiliano Zapata lead public outcry in Mexico for the overthrow of President Porfirio Díaz.

### 1911

In *Standard Oil Company of New Jersey et al. v. United States*, the U.S. Supreme Court upholds a decision by a U.S. circuit court that ordered the dissolution of the Standard Oil Company.

Illinois and Missouri begin to provide mothers' pensions to supplement the wages of certain widowed mothers.

The Dillingham Report concludes that the "new immigrants" are racially inferior to emigrants from northern and western Europe and contends that they are "incapable of becoming Americans."

President Taft sends U.S. troops to Nicaragua; this time they remain for more than a decade.

The death of 146 female garment workers in a fire at the Triangle Shirtwaist Company in New York City spurs passage of labor and safety laws.

Frederick Winslow Taylor's influential book *The Principles of Scientific Management* promotes the removal of human inefficiencies from the production process.

In *The Mind of Primitive Man*, anthropologist Franz Boas argues that the differences between cultures result from differences in historical conditions, not inherent racial predetermination.

Democrats take control of the House of Representatives for the first time since 1895.

### 1912

Textile workers in Lawrence, Massachusetts, strike across ethnic and skill lines, winning wage increases. Organized by "Big Bill" Haywood and Elizabeth Gurley Flynn of the IWW, the strike is hailed as a model of "new unionism."

The steamship *Titanic* sinks; more than 1,500 lives are lost, many of them American.

Democrat Woodrow Wilson, former governor of New Jersey, is elected president over Republican incumbent William Howard Taft, Progressive Party candidate Theodore Roosevelt, and candidates from the Socialist and Prohibitionist Parties.

### 1913

The Armory Show in New York City showcases modern art; among the painters featured is Edward Hopper.

The Sixteenth and Seventeenth Amendments to the U.S. Constitution are ratified; the Sixteenth gives the U.S. Congress the power to collect income taxes, and the Seventeenth provides for the direct election of senators.

The Underwood-Simmons Tariff Act of 1913 imposes the first income tax under the Sixteenth Amendment and significantly reduces import duties.

The Federal Reserve Act restructures the U.S. banking system.

The Webb-Kenyon Act of 1913 prohibits the interstate shipment of alcohol into states where its sale or use is illegal.

## 1914

World War I breaks out in Europe; President Wilson declares U.S. neutrality.

Private security forces and National Guard troops attack the camp of striking miners in Ludlow, California, killing 32 miners.

U.S. Congress passes the Federal Trade Commission Act of 1914, which creates a regulatory organization to investigate suspected monopolies.

The Clayton Antitrust Act of 1914 is enacted to supplement the Sherman Antitrust Act of 1890; its efforts to protect labor unions from antitrust rulings prove ineffective.

The Harrison Act of 1914 restricts the legal use of narcotics in the United States.

The Thomson-Urrutia Treaty of 1914 compensates Colombia for the role the United States played in the rebellion and eventual independence of Panama.

The Panama Canal opens; its construction has been supervised by engineer George Goethals.

President Wilson sends U.S. troops to support Pancho Villa in the Mexican Revolution.

## 1915

The first "Great Migration" begins; blacks move from the rural South to the urban North.

D. W. Griffith's film *Birth of a Nation* traces an idealized version of the development of the Ku Klux Klan and the white supremacy movement in the U.S. South. It is considered a milestone in the development of movies as an art form.

German submarines sink the British passenger ship *Lusitania*. One hundred twenty-eight U.S. citizens lose their lives in the attack.

In *Coppage v. Kansas*, the U.S. Supreme Court prohibits employers from forcing employees to sign contracts requiring that workers not join unions.

The U.S. Supreme Court declares the "grandfather clause" unconstitutional. The clause had restricted voting to those whose fathers or grandfathers had voted before 1867.

Eleven hundred women from around the world, including American social reformer and peace activist Jane Addams, convene in Holland to try to help bring an end to World War I.

The Wilson administration sends U.S. Marines to Haiti to suppress a revolution. Troops remain until 1934.

The Industrial Relations Commission delivers its report to President Wilson condemning industry's violent antiunion tactics.

Withdrawing U.S. military support for Pancho Villa, the Wilson administration recognizes the government of Venustiano Carranza of Mexico.

American Telephone and Telegraph sends the first transatlantic voice transmission.

## 1916

Pancho Villa retaliates against U.S. recognition of Venustiano Carranza's government in Mexico by executing several American civilians, while his forces raid Columbus, New Mexico, killing more Americans. General John J. Pershing leads a "punitive expedition" of 6,000 U.S. troops into Mexico but fails to catch Villa.

Louis Brandeis is appointed to the U.S. Supreme Court. He is the first American Jew to be so appointed.

Jeannette Rankin of Montana becomes the first woman elected to the House of Representatives.

U.S. Congress passes the Jones Act of 1916, which gives the Philippine Islands greater autonomy.

The Adamson Act of 1916 establishes an eight-hour day for railroad workers operating on interstate lines, without reducing their wages.

In an effort to curb child labor abuses, U.S. Congress passes the Keating-Owen Act of 1916. The law prohibits interstate shipments of products made by children under age 14 or by children ages 14 to 16 who had worked more than eight hours per day.

President Woodrow Wilson is narrowly reelected over Republican challenger Charles Evans Hughes.

Margaret Sanger establishes the first U.S. birth control clinic in Brooklyn, New York. The clinic provides assistance to nearly 500 women before police close its doors 10 days later. Sanger is jailed for violating New York State law forbidding distribution of birth control information.

The United States sets up a military government in the Dominican Republic when the nation rejects a treaty that would have made it a protectorate of the United States. American troops remain until 1924.

The Kern-McGillicuddy Workmen's Compensation Act enables workers to collect compensation for injuries sustained in the workplace.

Alice Paul and other radical suffragists form the National Woman's Party to fight for a federal suffrage amendment.

The National Park Service is established to manage and maintain the national system of federal parks and wilderness areas.

The Federal Farm Loan Act of 1916 makes low-interest loans available to farmers.

Charlie Chaplin appears in the two-reel silent comedy called *The Pawnshop*.

## 1917

The United States receives an intercepted message proposing a Mexican-German alliance.

The United States enters World War I.

The Committee for Public Information is established to distribute pro-war, anti-German propaganda.

The Selective Service Act of 1917 requires all men between the ages of 18 and 45 to register for military service.

U.S. Congress passes the Immigration Act of 1917, or the Alien Exclusion Act. The act sets quotas, creates an "Asiatic Barred Zone," and institutes a literacy test to restrict immigration.

The Espionage Act of 1917 suppresses treasonable and disloyal activities during World War I.

An estimated 100 blacks die in a three-day race riot in East St. Louis, Illinois.

The Jones Act of 1917 grants U.S. citizenship to the inhabitants of Puerto Rico and expands their role in the island's government.

U.S. secretary of state Robert Lansing and Viscount Kikujiro Ishii of Japan negotiate the Lansing-Ishii Agreement of 1917, which recognizes Japan's special commercial interests in China.

Bolsheviks seize power in the Russian Revolution, provoking anticommunist hysteria among Americans.

Margaret Sanger helps organize the National Birth Control League, which ultimately evolves into the Planned Parenthood Federation of America.

## 1918

The U.S. government assumes control over the national rail system to support the war effort.

In his "Fourteen Points" speech, President Wilson outlines his plan for a fair and lasting European peace.

President Wilson establishes the National War Labor Board to formalize federal policies for dealing with organized labor during World War I.

The first wave of a deadly strain of influenza reaches the United States; within a year it has decimated world populations.

In *Hammer v. Dagenhart*, the U.S. Supreme Court invalidates the child labor control measure, the Keating-Owen Act of 1916.

U.S. Congress passes the Sedition Act of 1918, prohibiting criticism of the U.S. war effort.

Americans write a new constitution for Haiti, occupied by U.S. troops since 1915.

Socialist Party leader Eugene V. Debs is convicted under the Espionage Act of 1917 for making antiwar speeches.

The Allies (France and Britain), strengthened by newly arrived U.S. troops under General John Pershing, turn back a German offensive along the Marne River.

The massive Argonne Offensive, fought largely by U.S. troops, weakens the German army; Germany agrees to an armistice, and President Wilson sails for France to participate in a peace conference.

## 1919

The Eighteenth Amendment of the U.S. Constitution, which prohibits the sale of alcohol nationwide, is ratified. The Volstead Act of 1919 provides for its enforcement.

Alice Hamilton appointed assistant professor of industrial medicine at Harvard Medical School; she becomes the first woman on the faculty.

Industry magnates led by John D. Rockefeller launch the "American Plan" to roll back the wartime gains of labor unions.

The first citywide general strike immobilizes Seattle for six days. At the end of the strike, the workers have won none of their demands.

President Wilson unsuccessfully urges U.S. Congress to ratify the Treaty of Versailles, which calls for American membership in the League of Nations; Senator Henry Cabot Lodge leads congressional resistance to ratification.

Jack Dempsey becomes heavyweight champion of the world.

Twenty-five race riots break out in American cities, killing and wounding hundreds of people. This period is known as the Red Summer.

U.S. Congress passes the Child Labor Act of 1919 in an attempt to protect children in the workplace.

The American Farm Bureau is founded to lobby for the interests of farmers, who represent 25 percent of voters.

The U.S. Supreme Court upholds the Espionage Act of 1917 and the Sedition Act of 1918, asserting that the "clear and present danger" of war makes certain types of free speech subversive.

The "Black Sox" scandal, in which Chicago White Sox players accept bribes in exchange for purposely losing the World Series, damages baseball's popularity.

Bolsheviks found the Third International (or Comintern) to export revolution around the world; American socialists who support the Russian Revolution form an American communist party.

Steelworkers wage a strike of 365,000 in September, signaling the end of the uneasy truce between industry and labor during World War I; by January, the strike ends in failure and 22 strikers have been killed.

Responding to a wave of strikes after the war, Attorney General A. Mitchell Palmer counterattacks with a series of raids targeting labor militants and radicals. Thousands of radical activists and writers are arrested or deported in the “Red Scare” raids, including Emma Goldman.

## 1920

Esch-Cummins Act of 1920 returns railroads to private control.

Marcus Garvey, founder of the Universal Negro Improvement Association, addresses 25,000 blacks in New York City, calling for a “back to Africa” movement.

Forty-six nations participate in the first meeting of the League of Nations.

The Nineteenth Amendment to the U.S. Constitution is ratified, giving American women the vote.

KDKA in Pittsburgh becomes the first radio station to institute regular broadcasting when it covers the Cox-Harding presidential race nightly.

Republican Warren G. Harding, formerly a senator from Ohio, is elected president over Democrat James M. Cox; President Harding’s tenure is marked by scandal.

Eugene O’Neill’s play *The Emperor Jones*, which later stars Paul Robeson, opens on Broadway.

## 1921

L. C. Dyer, a white congressman from Missouri, proposes an antilynching law; it is passed in the House but not in the Senate.

Immigration to the United States is limited by the first of a series of quota acts.

The U.S.-German Peace Treaty of 1921 adopts most measures of the Treaty of Versailles, but excludes participation in the League of Nations and the International Labor Organization. The agreement formally ends World War I for the United States.

Great Britain, the United States, Japan, and France agree to respect one another’s island territories in the Pacific Ocean and to confer with the other party in the event of any disputes in the Four Power Pacific Treaty of 1921.

U.S. Congress passes the Budget and Accounting Act, which provides guidelines for the modern budget and expands presidential control over federal spending.

## 1922

The “Harlem Renaissance” is initiated with Claude McKay’s book of poetry titled *Harlem Shadows*.

U.S. Congress passes the Capper-Volstead Act of 1922, which exempts various agricultural associations, producers, and cooperatives from antitrust laws.

Poet T. S. Eliot publishes *The Waste Land*.

In *Balzac v. Puerto Rico*, the U.S. Supreme Court denies citizens of the U.S. territory of Puerto Rico the rights guaranteed by the Constitution of the United States.

The Cable Act establishes that women neither gain nor lose American citizenship through marriage.

In the Yap Treaty of 1922 the United States formally agrees to the Japanese claim on the former German possession of Yap, in the Caroline Islands.

In *Bailey v. Drexel Furniture Company*, the U.S. Supreme Court invalidates the Child Labor Act of 1919.

The United States, Britain, France, Japan, Italy, Belgium, the Netherlands, China, and Portugal sign the Nine Power Pact of 1922. The agreement reaffirms the Open-Door Policy toward China and reflects a consensus of opinion in their relations with China.

U.S. Congress passes the Fordney-McCumber Tariff to protect the American chemical and metal industries, which developed considerably during World War I.

After a massive federal injunction, the Railroad Shopmen’s Strike, involving more than 400,000 railroad craft workers, is lost in a defeat that signals the rapidly declining power of labor.

## 1923

Alice Paul introduces the Equal Rights Amendment proposal to U.S. Congress; the proposed amendment will be debated off and on for most of the rest of the century.

In *Adkins v. Children’s Hospital*, the U.S. Supreme Court rules that sex-specific minimum wage laws are unconstitutional.

President Warren G. Harding dies in office; Vice President Calvin Coolidge, a former governor of Massachusetts, succeeds him.

Secretary of the Interior Albert Fall is accused of accepting bribes in exchange for oil rights on public lands in the Teapot Dome scandal. He becomes the first cabinet member to be convicted of a crime.

## 1924

U.S. Congress passes the Indian Citizenship Act, which gives all Native Americans U.S. citizenship without affecting their rights to tribal property.

Calvin Coolidge wins the presidential race against Democrat John W. Davis and Progressive Party candidate Robert M. La Follette.

The National Origins (Immigration) Act of 1924 further decreases the number of immigrants allowed into the United States each year and creates the Border Patrol to police U.S. land borders.

The Virginia legislature passes the Racial Integrity Act, which bans interracial marriage and requires all residents to register their race with the state.

J. Edgar Hoover becomes director of the Bureau of Investigation, a department of the Justice Department that later becomes the FBI.

Composer George Gershwin's *Rhapsody in Blue*, a piece that combines the rhythms of jazz with classical orchestration, is first performed.

Under orders from the Soviet Comintern, two American communist parties merge, eventually becoming known as the Communist Party of the United States of America.

Defense attorney Clarence Darrow uses psychological testimony to argue against the death penalty in the trial of accused murderers Nathan Leopold and Richard Loeb.

U.S. Congress approves the Soldiers' Bonus to compensate soldiers for income lost during the war.

## 1925

U.S. Congress passes the Kelly Air Mail Act, which establishes contracts with commercial airlines for the delivery of U.S. mail by air.

Lawyer Clarence Darrow defends John Scopes, a young Tennessee teacher accused of teaching Darwin's theory of evolution rather than the biblical creation story required by state law. Three-time presidential candidate William Jennings Bryan serves as chief attorney for the prosecution.

In a case in Detroit, Ossian Sweet, an African-American doctor, and his family and friends are put on trial for murder after a crowd member dies during a housing riot. An all-white jury cannot agree on guilt or acquittal. Within a month, Henry Sweet, one of the defendants, is acquitted in a separate trial, in a decision that affirms the rights of African Americans.

The U.S. Supreme Court decision *Pierce v. Society of the Sisters* overturns an Oregon state law that requires all children between the ages of eight and 16 to attend public school.

## 1926

General Billy Mitchell resigns from the U.S. Army after a court-martial for insubordination; he had charged that the U.S. military was paying insufficient attention to air power.

A strike of 20,000 textile workers in Passaic, New Jersey, fails; union membership nationwide declines.

Ernest Hemingway's novel *The Sun Also Rises* is published.

Jazz musician Louis Armstrong begins his "four golden years" when he records his "Hot Five" and "Hot Seven" tracks.

The Watson-Parker Act of 1926 establishes the U.S. Board of Mediation to negotiate with parties involved in railroad labor disputes.

## 1927

Charles Lindbergh completes the first solo airplane flight from New York to Paris.

Richard Byrd of the U.S. Navy successfully completes the first airplane flight over the North Pole.

Nicola Sacco and Bartolomeo Vanzetti, immigrants and political radicals, are executed after a controversial and widely publicized murder trial.

The Supreme Court in *Buck v. Bell* affirms the rights of states to demand that those thought mentally deficient or otherwise likely to become wards of the state be forcibly sterilized.

Babe Ruth of the New York Yankees sets a record with 60 home runs during a 154-game season.

## 1928

Fifteen nations sign the Pact of Paris as an attempt to eliminate war as an instrument of national policy and to settle international disputes through peaceful means.

In *Olmstead v. United States*, the U.S. Supreme Court allows the admission of wiretapping evidence in court.

The Clark Memorandum on the Monroe Doctrine limits the U.S. right to intervene in Latin American affairs.

In *Coming of Age in Samoa*, anthropologist Margaret Mead argues that culture, not biology, determines gender identity and sexual behavior.

The *Amos 'n' Andy* radio program goes on the air; the first commercially successful serial, it garners 40 million listeners, fully one-third the U.S. population.

Republican candidate Herbert Hoover wins the presidential election over Democratic candidate Alfred E. Smith.

## Theodore Roosevelt's "Strenuous Life" Speech, April 10, 1899

*Landmark Documents in American History.*  
CD-ROM (New York: Facts On File, 1995)

In speaking to you, men of the greatest city of the West, men of the State which gave to the country Lincoln and Grant, men who preeminently and distinctly embody all that is most American in the American character, I wish to preach, not the doctrine of ignoble ease, but the doctrine of the strenuous life, the life of toil and effort, of labor and strife; to preach that highest form of success which comes, not to the man who desires mere easy peace, but to the man who does not shrink from danger, from hardship, or from bitter toil, and who out of these wins the splendid ultimate triumph.

A life of slothful ease, a life of that peace which springs merely from lack either of desire or of power to strive after great things, is as little worthy of a nation as of an individual. I ask only that what every self-respecting American demands from himself and from his sons shall be demanded of the American nation as a whole. Who among you would teach you boys that ease, that peace, is to be the first consideration in their eyes—to be the ultimate goal after which they strive? You men of Chicago have made this city great, you men of Illinois have done your share, and more than your share, in making America great, because you neither preach nor practice such a doctrine. You work yourselves, and you bring up your sons to work. If you are rich and are worth your salt, you will teach your sons that though they may have leisure, it is not to be spent in idleness; for wisely used leisure merely means that those who possess it, being free from the necessity of working for their livelihood, are all the more bound to carry on some kind of non-remunerative work in science, in letters, in art, in exploration, in historical research—work of the type we most need in

this country, the successful carrying out of which reflects most honor upon the nation. We do not admire the man of timid peace. We admire the man who embodies victorious effort; the man who never wrongs his neighbor, who is prompt to help a friend, but who has those virile qualities necessary to win in the stern strife of actual life. It is hard to fail, but it is worse never to have tried to succeed. In this life we get nothing save by effort. Freedom from effort in the present merely means that there has been stored up effort in the past. A man can be freed from the necessity of work only by the fact that he or his fathers before him have worked to good purpose. If the freedom thus purchased is used aright, and the man still does actual work, though of a different kind, whether as a writer or a general, whether in the field of politics or in the field of exploration and adventure, he shows he deserves his good fortune. But if he treats this period of freedom from the need of actual labor as a period, not of preparation, but of mere enjoyment, even though perhaps not of vicious enjoyment, he shows that he is simply a cumberer of the earth's surface, and he surely unfits himself to hold his own with his fellows if the need to do so should again arise. A mere life of ease is not in the end a very satisfactory life, and, above all, it is a life which ultimately unfits those who follow it for serious work in the world.

In the last analysis a healthy state can exist only when the men and women who make it up lead clean, vigorous, healthy lives; when the children are so trained that they shall endeavor, not to shirk difficulties, but to overcome them; not to seek ease, but to know how to wrest triumph from toil and risk. The man must be glad to do a man's work, to dare and endure and to labor; to keep himself, and to keep those dependent upon him. The woman must be the housewife, the helpmeet of the homemaker, the wise and fearless mother of many healthy children. In one of Daudet's powerful and melancholy books he speaks of "the

fear of maternity, the haunting terror of the young wife of the present day." When such words can be truthfully written of a nation, that nation is rotten to the heart's core. When men fear work or fear righteous war, when women fear motherhood, they tremble on the brink of doom; and well it is that they should vanish from the earth, where they are fit subjects for the scorn of all men and women who are themselves strong and brave and high-minded.

As it is with the individual, so it is with the nation. It is a base untruth to say that happy is the nation that has no history. Thrice happy is the nation that has a glorious history. Far better it is to dare mighty things, to win glorious triumphs, even though checkered by failure, than to take rank with those poor spirits who neither enjoy much nor suffer much, because they live in the gray twilight that knows not victory nor defeat. If in 1861 the men who loved the Union had believed that peace was the end of all things, and war and strife the worst of all things, and had acted up to their belief, we would have saved hundreds of thousands of lives, we would have saved hundreds of millions of dollars. Moreover, besides saving all the blood and treasure we then lavished, we would have prevented the heartbreak of many women, the dissolution of many homes, and we would have spared the country those months of gloom and shame when it seemed as if our armies marched only to defeat. We could have avoided all this suffering simply by shrinking from strife. And if we had thus avoided it, we would have shown that we were weaklings, and that we were unfit to stand among the great nations of the earth. Thank God for the iron in the blood of our fathers, the men who upheld the wisdom of Lincoln, and bore sword or rifle in the armies of Grant! Let us, the children of the men who proved themselves equal to the mighty days, let us, the children of the men who carried the great Civil War to a triumphant conclusion, praise the God of our fathers that the ignoble counsels of peace were rejected; that the suffering and loss, the blackness of sorrow and despair, were unflinchingly faced, and the years of strife endured; for in the end the slave was freed, the Union restored, and the mighty American republic placed once more as a helmeted queen among nations.

We of this generation do not have to face a task such as that our fathers faced, but we have our tasks, and woe to us if we fail to perform them! We cannot, if we would, play the part of China, and be content to rot by inches in ignoble ease within our borders, taking no interest in what goes on beyond them, sunk in a scrambling commercialism; heedless of the higher life, the life of aspiration, of toil and risk, busying ourselves only with the wants of our bodies for the day, until suddenly we should find, beyond a shadow of question, what China has already found, that in this world the nation that has trained itself to a career of unwarlike and isolated ease is bound, in the end, to go down before

other nations which have not lost the manly and adventurous qualities. If we are to be a really great people, we must strive in good faith to play a great part in the world. We cannot avoid meeting great issues. All that we can determine for ourselves is whether we shall meet them well or ill. In 1898 we could not help being brought face to face with the problem of war with Spain. All we could decide was whether we should shrink like cowards from the contest, or enter into it as beseemed a brave and high-spirited people; and, once in, whether failure or success should crown our banners. So it is now. We cannot avoid the responsibilities that confront us in Hawaii, Cuba, Porto Rico, and the Philippines. All we can decide is whether we shall meet them in a way that will redound to the national credit, or whether we shall make of our dealings with these new problems a dark and shameful page in our history. To refuse to deal with them at all merely amounts to dealing with them badly. We have a given problem to solve. If we undertake the solution, there is, of course, always danger that we may not solve it aright; but to refuse to undertake the solution simply renders it certain that we cannot possibly solve it aright. The timid man, the lazy man, the man who distrusts his country, the over-civilized man, who has lost the great fighting, masterful virtues, the ignorant man, and the man of dull mind, whose soul is incapable of feeling the mighty lift that thrills "stern men with empires in their brains"—all these, of course, shrink from seeing the nation undertake its new duties; shrink from seeing us build a navy and an army adequate to our needs; shrink from seeing us do our share of the world's work, by bringing order out of chaos in the great, fair tropic islands from which the valor of our soldiers and sailors has driven the Spanish flag. These are the men who fear the strenuous life, who fear the only national life which is really worth leading. They believe in that cloistered life which saps the hardy virtues in a nation, as it saps them in the individual; or else they are wedded to that base spirit of gain and greed which recognizes in commercialism the be-all and end-all of national life, instead of realizing that, though an indispensable element, it is, after all, but one of the many elements that go to make up true national greatness. No country can long endure if its foundations are not laid deep in the material prosperity which comes from thrift, from business energy and enterprise, from hard, unsparing effort in the fields of industrial activity; but neither was any nation ever yet truly great if it relied upon material prosperity alone. All honor must be paid to the architects of our material prosperity, to the great captains of industry who have built our factories and our rail-roads, to the strong men who toil for wealth with brain or hand; for great is the debt of the nation to these and their kind. But our debt is yet greater to the men whose highest type is to be found in a statesman like Lincoln, a soldier like Grant. They showed by their lives that they recognized the

law of work, the law of strife; they toiled to win a competence for themselves and those dependent upon them; but they recognized that there were yet other and even loftier duties—duties to the nation and duties to the race.

We cannot sit huddled within our own borders and avow ourselves merely an assemblage of well-to-do hucksters who care nothing for what happens beyond. Such a policy would defeat even its own end; for as the nations grow to have ever wider and wider interests, and are brought into closer and closer contact, if we are to hold our own in the struggle for naval and commercial supremacy, we must build up our power without our own borders. We must build the isthmian canal, and we must grasp the points of vantage which will enable us to have our say in deciding the destiny of the oceans of the East and the West.

So much for the commercial side. From the standpoint of international honor the argument is even stronger. The guns that thundered off Manila and Santiago left us echoes of glory, but they also left us a legacy of duty. If we drove out a medieval tyranny only to make room for savage anarchy, we had better not have begun the task at all. It is worse than idle to say that we have no duty to perform, and can leave to their fates the islands we have conquered. Such a course would be the course of infamy. It would be followed at once by utter chaos in the wretched islands themselves. Some stronger, manlier power would have to step in and do the work, and we would have shown ourselves weaklings, unable to carry to successful completion the labors that great and high-spirited nations are eager to undertake.

The work must be done; we cannot escape our responsibility; and if we are worth our salt, we shall be glad of the chance to do the work—glad of the chance to show ourselves equal to one of the great tasks set modern civilization. But let us not deceive ourselves as to the importance of the task. Let us not be misled by vainglory into underestimating the strain it will put on our powers. Above all, let us, as we value our own self-respect, face the responsibilities with proper seriousness, courage, and high resolve. We must demand the highest order of integrity and ability in our public men who are to grapple with these new problems. We must hold to a rigid accountability those public servants who show unfaithfulness to the interests of the nation or inability to rise to the high level of the new demands upon our strength and our resources.

Of course we must remember not to judge any public servant by any one act, and especially should we beware of attacking the men who are merely the occasions and not the causes of disaster. Let me illustrate what I mean by the army and the navy. If twenty years ago we had gone to war, we should have found the navy as absolutely unprepared as the army. At that time our ships could not have encountered with success the fleets of Spain any more than nowadays we can put untrained soldiers, no matter how

brave, who are armed with archaic black-powder weapons, against well-drilled regulars armed with the highest type of modern repeating rifle. But in the early eighties the attention of the nation became directed to our naval needs. Congress most wisely made a series of appropriations to build up a new navy, and under a succession of able and patriotic secretaries, of both political parties, the navy was gradually built up, until its material became equal to its splendid personnel, with the result that in the summer of 1898 it leaped to its proper place as one of the most brilliant and formidable fighting navies in the entire world. We rightly pay all honor to the men controlling the navy at the time it won these great deeds, honor to Secretary Long and Admiral Dewey, to the captains who handled the ships in action, to the daring lieutenants who braved death in the smaller craft, and to the heads of bureaus at Washington who saw that the ships were so commanded, so armed, so equipped, so well engined, as to insure the best results. But let us also keep ever in mind that all of this would not have availed if it had not been for the wisdom of the men who during the preceding fifteen years had built up the navy. Keep in mind the secretaries of the navy during those years; keep in mind the senators and congressmen who by their votes gave the money necessary to build and to armor the ships, to construct the great guns, and to train the crews; remember also those who actually did build the ships, the armor, and the guns; and remember the admirals and captains who handled battle-ship, cruiser, and torpedo-boat on the high seas, alone and in squadrons, developing the seamanship, the gunnery, and the power of acting together, which their successors utilized so gloriously at Manila and off Santiago. And, gentlemen, remember the converse, too. Remember that justice has two sides. Be just to those who built up the navy, and, for the sake of the future of the country, keep in mind those who opposed its building up. Read the "Congressional Record." Find out the senators and congressmen who opposed the grants for building the new ships; who opposed the purchase of armor, without which the ships were worthless; who opposed any adequate maintenance for the Navy Department, and strove to cut down the number of men necessary to man our fleets. The men who did these things were one and all working to bring disaster on the country. They have no share in the glory of Manila, in the honor of Santiago. They have no cause to feel proud of the valor of our sea-captains, of the renown of our flag. Their motives may or may not have been good, but their acts were heavily fraught with evil. They did ill for the national honor, and we won in spite of their sinister opposition.

Now, apply all this to our public men of to-day. Our army has never been built up as it should be built up. I shall not discuss with an audience like this the puerile suggestion that a nation of seventy millions of freemen is in

danger of losing its liberties from the existence of an army of one hundred thousand men, three fourths of whom will be employed in certain foreign islands, in certain coast fortresses, and on Island reservations. No man of good sense and stout heart can take such a proposition seriously. If we are such weaklings as the proposition implies, then we are unworthy of freedom in any event. To no body of men in the United States is the country so much indebted as to the splendid officers and enlisted men of the regular army and navy. There is no body from which the country has less to fear, and none of which it should be prouder, none which it should be more anxious to upbuild.

Our army needs complete reorganization,—not merely enlarging,—and the reorganization can only come as the result of legislation. A proper general staff should be established, and the positions of ordinance, commissary, and quartermaster officers should be filled by detail from the line. Above all, the army must be given the chance to exercise in large bodies. Never again should we see, as we saw in the Spanish war, major-generals in command of divisions who had never before commanded three companies together in the field. Yet, incredible to relate, Congress has shown a queer inability to learn some of the lessons of the war. There were large bodies of men in both branches who opposed the declaration of war, who opposed the ratification of peace, who opposed the upbuilding of the army, and who even opposed the purchase of armor at a reasonable price for the battle-ships and cruisers, thereby putting an absolute stop to the building of any new fighting-ships for the navy. If, during the years to come, any disaster should befall our arms, afloat or ashore, and thereby any shame come to the United States, remember that the blame will lie upon the men whose names appear upon the roll-calls of Congress on the wrong side of these great questions. On them will lie the burden of any loss of our soldiers and sailors, of any dishonor to the flag; and upon you and the people of this country will lie the blame if you do not repudiate, in no unmistakable way, what these men have done. The blame will not rest upon the untrained commander of untried troops, upon the civil officers of a department the organization of which has been left utterly inadequate, or upon the admiral with an insufficient number of ships; but upon the public men who have so lamentably failed in forethought as to refuse to remedy these evils long in advance, and upon the nation that stands behind those public men.

So, at the present hour, no small share of the responsibility for the blood shed in the Philippines, the blood of our brothers, and the blood of their wild and ignorant foes, lies at the thresholds of those who so long delayed the adoption of the treaty of peace, and of those who by their worse than foolish words deliberately invited a savage people to plunge into a war fraught with sure disaster for them—a war, too,

in which our own brave men who follow the flag must pay with their blood for the silly, mock humanitarianism of the prattlers who sit at home in peace.

The army and the navy are the sword and the shield which this nation must carry if she is to do her duty among the nations of the earth—if she is not to stand merely as the China of the western hemisphere. Our proper conduct toward the tropic islands we have wrested from Spain is merely the form which our duty has taken at the moment. Of course we are bound to handle the affairs of our own household well. We must see that there is civic honesty, civic cleanliness, civic good sense in our home administration of city, State, and nation. We must strive for honesty in office, for honesty toward the creditors of the nation and of the individual; for the widest freedom of individual initiative where possible, and for the wisest control of individual initiative where it is hostile to the welfare of the many. But because we set our own household in order we are not thereby excused from playing our part in the great affairs of the world. A man's first duty is to his own home, but he is not thereby excused from doing his duty to the State; for if he fails in this second duty it is under the penalty of ceasing to be a freeman. In the same way, while a nation's first duty is within its own borders, it is not thereby absolved from facing its duties in the world as a whole; and if it refuses to do so, it merely forfeits its right to struggle for a place among the peoples that shape the destiny of mankind.

In the West Indies and the Philippines alike we are confronted by most difficult problems. It is cowardly to shrink from solving them in the proper way; for solved they must be, if not by us, then by some stronger and more manful race. If we are too weak, too selfish, or too foolish to solve them, some bolder and abler people must undertake the solution. Personally, I am far too firm a believer in the greatness of my country and the power of my countrymen to admit for one moment that we shall ever be driven to the ignoble alternative.

The problems are different for the different islands. Porto Rico is not large enough to stand alone. We must govern it wisely and well, primarily in the interest of its own people. Cuba is, in my judgment, entitled ultimately to settle for itself whether it shall be an independent state or an integral portion of the mightiest of republics. But until order and stable liberty are secured, we must remain in the island to insure them, and infinite tact, judgment, moderation, and courage must be shown by our military and civil representatives in keeping the island pacified, in relentlessly stamping out brigandage, in protecting all alike, and yet in showing proper recognition to the men who have fought for Cuban liberty. The Philippines offer a yet graver problem. Their population includes half-caste and native Christians, warlike Moslems, and wild pagans.

Many of their people are utterly unfit for self-government, and show no signs of becoming fit. Others may in time become fit but at present can only take part in self-government under a wise supervision, at once firm and beneficent. We have driven Spanish tyranny from the islands. If we now let it be replaced by savage anarchy, our work has been for harm and not for good. I have scant patience with those who fear to undertake the task of governing the Philippines, and who openly avow that they do fear to undertake it, or that they shrink from it because of the expense and trouble; but I have even scantier patience with those who make a pretense of humanitarianism to hide and cover their timidity, and who can about "liberty" and the "consent of the governed," in order to excuse themselves for their unwillingness to play the part of men. Their doctrines, if carried out, would make it incumbent upon us to leave the Apaches of Arizona to work out their own salvation, and to decline to interfere in a single Indian reservation. Their doctrines condemn your forefathers and mine for ever having settled in these United States.

England's rule in India and Egypt has been of great benefit to England, for it has trained up generations of men accustomed to look at the larger and loftier side of public life. It has been of even greater benefit to India and Egypt. And finally, and most of all, it has advanced the cause of civilization. So, if we do our duty aright in the Philippines, we will add to that national renown which is the highest and finest part of national life, will greatly benefit the people of the Philippine Islands, and, above all, we will play our part well in the great work of uplifting mankind. But to do this work, keep ever in mind that we must show in a very high degree the qualities of courage, of honesty, and of good judgment. Resistance must be stamped out. The first and all-important work to be done is to establish the supremacy of our flag. We must put down armed resistance before we can accomplish anything else, and there should be no parleying, no faltering, in dealing with our foe. As for those in our own country who encourage the foe, we can afford contemptuously to disregard them; but it must be remembered that their utterances are not saved from being treasonable merely by the fact that they are despicable.

When once we have put down armed resistance, when once our rule is acknowledged, then an even more difficult task will begin, for then we must see to it that the islands are administered with absolute honesty and with good judgment. If we let the public service of the islands be turned into the prey of the spoils politician, we shall have begun to tread the path which Spain trod to her own destruction. We must send out there only good and able men, chosen for their fitness, and not because of their partisan service, and these men must not only administer impartial justice to the natives and serve their own government with honesty and fidelity, but must show the utmost tact and firmness,

remembering that, with such people as those with whom we are to deal, weakness is the greatest of crimes, and that next to weakness comes back of consideration for their principles and prejudices.

I preach to you, then, my countrymen, that our country calls not for the life of ease but for the life of strenuous endeavor. The twentieth century looms before us big with the fate of many nations. If we stand idly by, if we seek merely swollen, slothful ease and ignoble peace, if we shrink from the hard contests where men must win at hazard of their lives and at the risk of all they hold dear, then the bolder and stronger peoples will pass us by, and will win for themselves the domination of the world. Let us therefore boldly face the life of strife, resolute to do our duty well and manfully; resolute to uphold righteousness by deed and by word; resolute to be both honest and brave, to serve high ideals, yet to use practical methods. Above all, let us shrink from no strife, moral or physical, within or without the nation, provided we are certain that the strife is justified, for it is only through strife, through hard and dangerous endeavor, that we shall ultimately win the goal of true national greatness.

### Niagara Movement Declaration of Principles (July 1905)

Courtesy of the University of Massachusetts at Amherst.  
University Library. Special Collections and Archives.

#### Progress

The members of the conference, known as the Niagara Movement, assembled in annual meeting at Buffalo, July 11th, 12th and 13th, 1905, congratulate the Negro-Americans on certain undoubted evidences of progress in the last decade, particularly the increase of intelligence, the buying of property, the checking of crime, the uplift in home life, the advance in literature and art, and the demonstration of constructive and executive ability in the conduct of great religious, economic and educational institutions.

#### Suffrage

At the same time, we believe that this class of American citizens should protest emphatically and continually against the curtailment of their political rights. We believe in manhood suffrage; we believe that no man is so good, intelligent or wealthy as to be entrusted wholly with the welfare of his neighbor.

#### Civil Liberty

We believe also in protest against the curtailment of our civil rights. All American citizens have the right to equal treatment in places of public entertainment according to their behavior and deserts.

### **Economic Opportunity**

We especially complain against the denial of equal opportunities to us in economic life; in the rural districts of the South this amounts to peonage and virtual slavery; all over the South it tends to crush labor and small business enterprises; and everywhere American prejudice, helped often by iniquitous laws, is making it more difficult for Negro Americans to earn a decent living.

### **Education**

Common school education should be free to all American children and compulsory. High school training should be adequately provided for all, and college training should be the monopoly of no class or race in any section of our common country. We believe that, in defense of our own institutions, the United States should aid common school education, particularly in the South, and we especially recommend concerted agitation to this end. We urge an increase in public high school facilities in the South, where the Negro-Americans are almost wholly without such provisions. We favor well-equipped trade and technical schools for the training of artisans, and the need of adequate and liberal endowment for a few institutions of higher education must be patent to sincere well-wishers of the race.

### **Courts**

We demand upright judges in courts, juries selected without discrimination on account of color and the same measure of punishment and the same efforts at reformation for black as for white offenders. We need orphanages and farm schools for dependent children, juvenile reformatories for delinquents, and the abolition of the dehumanizing convict-lease system.

### **Public Opinion**

We note with alarm the evident retrogression in this land of sound public opinion on the subject of manhood rights, republican government and human brotherhood, and we pray God that this nation will not degenerate into a mob of boasters and oppressors, but rather will return to the faith of the fathers, that all men were created free and equal, with certain unalienable rights.

### **Health**

We plead for health—for an opportunity to live in decent houses and localities, for a chance to rear our children in physical and moral cleanliness.

### **Employers and Labor Unions**

We hold up for public execration the conduct of two opposite classes of men: The practice among employers of importing ignorant Negro-American laborers in emergencies, and then affording them neither protection nor

permanent employment; and the practice of labor unions in proscribing and boycotting and oppressing thousands of their fellow-toilers, simply because they are black. These methods have accentuated and will accentuate the war of labor and capital, and they are disgraceful to both sides.

### **Protest**

We refuse to allow the impression to remain that the Negro-American assents to inferiority, is submissive under oppression and apologetic before insults. Through helplessness we may submit, but the voice of protest of ten million Americans must never cease to assail the ears of their fellows, so long as America is unjust.

### **Color-Line**

Any discrimination based simply on race or color is barbarous, we care not how hallowed it be by custom, expediency, or prejudice. Differences made on account of ignorance, immorality, or disease are legitimate methods of fighting evil, and against them we have no world of protest; but discriminations based simply and solely on physical peculiarities, place of birth, color or skin, are relics of that unreasoning human savagery of which the world is and ought to be thoroughly ashamed.

### **“Jim Crow” Cars**

We protest against the “Jim Crow” car, since its effect is and must be to make us pay first-class fare for third-class accommodations, render us open to insults and discomfort and to crucify wantonly our manhood, womanhood and self-respect.

### **Soldiers**

We regret that this nation has never seen fit adequately to reward the black soldiers who, in its five wars, have defended their country with their blood, and yet have been systematically denied the promotions which their abilities deserve. And we regard as unjust, the exclusion of black boys from the military and navy training schools.

### **War Amendments**

We urge upon Congress the enactment of appropriate legislation for securing the proper enforcement of those articles of freedom, the thirteenth, fourteenth and fifteenth amendments of the Constitution of the United States.

### **Oppression**

We repudiate the monstrous doctrine that the oppressor should be the sole authority as to the rights of the oppressed. The Negro race in America stolen, ravished and degraded, struggling up through difficulties and oppression, needs sympathy and receives criticism; needs help and is given hindrance, needs protection and is given mob-violence,

needs justice and is given charity, needs leadership and is given cowardice and apology, needs bread and is given a stone. This nation will never stand justified before God until these things are changed.

### **The Church**

Especially are we surprised and astonished at the recent attitude of the church of Christ—on the increase of a desire to bow to racial prejudice, to narrow the bounds of human brotherhood, and to segregate black men in some outer sanctuary. This is wrong, unchristian and disgraceful to the twentieth century civilization.

### **Agitation**

Of the above grievances we do not hesitate to complain, and to complain loudly and insistently. To ignore, overlook, or apologize for these wrongs is to prove ourselves unworthy of freedom. Persistent manly agitation is the way to liberty, and toward this goal the Niagara Movement has started and asks the co-operation of all men of all races.

### **Help**

At the same time we want to acknowledge with deep thankfulness the help of our fellowmen from the abolitionist down to those who to-day still stand for equal opportunity and who have given and still give of their wealth and of their poverty for our advancement.

### **Duties**

And while we are demanding, and ought to demand, and will continue to demand the rights enumerated above, God forbid that we should ever forget to urge corresponding duties upon our people:

The duty to vote.

The duty to respect the rights of others.

The duty to work.

The duty to obey the laws.

The duty to be clean and orderly.

The duty to send our children to school.

The duty to respect ourselves, even as we respect others.

This statement, complaint and prayer we submit to the American people, and Almighty God.

## **Preamble to the Constitution of the Industrial Workers of the World, 1905**

The Archives of Labor and Urban Affairs,  
Walter P. Reuther Library, Wayne State University

### **Preamble**

The working class and the employing class have nothing in common. There can be no peace so long as hunger and want are found among millions of working people and the

few, who make up the employing class, have all the good things of life.

Between these two classes a struggle must go on until the workers of the world organize as a class, take possession of the earth and the machinery of production, and abolish the wage system.

We find that the centering of the management of industries into fewer and fewer hands makes the trade unions unable to cope with the ever growing power of the employing class. The trade unions foster a state of affairs which allows one set of workers to be pitted against another set of workers in the same industry, thereby helping defeat one another in wage wars. Moreover, the trade unions aid the employing class to mislead the workers into the belief that the working class have interests in common with their employers. These conditions can be changed and the interest of the working class upheld only by an organization formed in such a way that all its members in any one industry, or in all industries, if necessary, cease work whenever a strike or lockout is on in any department thereof, thus making an injury to one an injury to all.

Instead of the conservative motto, "A fair day's wages for a fair day's work," we must inscribe on our banner the revolutionary watchword, "Abolition of the wage system."

It is the historic mission of the working class to do away with capitalism. The army of production must be organized, not only for the every day struggle with capitalists, but also to carry on production when capitalism shall have been overthrown. By organizing industrially we are forming the structure of the new society within the shell of the old.

Knowing, therefore, that such an organization is absolutely necessary for our emancipation, we unite under the following constitution:

## ***Muller v. Oregon, 1908***

28 *Supreme Court Reporter*, pp. 324–327

(208 U.S. 412) *Curt Muller*,

*Plff. in Err.*, v. *State of Oregon*

Argued January 15, 1908. Decided February 24, 1908.

Mr. Justice Brewer delivered the opinion of the court:

On February 19, 1903, the legislature of the state of Oregon passed an act (Session Laws 1903, p. 148) the first section of which is in these words:

"Sec. 1. That no female (shall) be employed in any mechanical establishment, or factory, or laundry in this state more than ten hours during any one day. The hours of work may be so arranged as to permit the employment of females at any time so that they shall not work more than ten hours during the twenty-four hours of any one day."

Sec. 3 made a violation of the provisions of the prior sections a misdemeanor subject to a fine of not less than \$10 nor more than \$25. On September 18, 1905, an information was filed in the circuit court of the state for the county of Multnomah, charging that the defendant "on the 4th day of September, A.D. 1905, in the county of Multnomah and state of Oregon, then and there being the owner of a laundry, known as the Grand Laundry, in the city of Portland, and the employer of females therein, did then and there unlawfully permit and suffer one Joe Haselbock, he, the said Joe Haselbock, then and there being an overseer, superintendent, and agent of said Curt Muller, in the said Grand Laundry, to require a female, to wit, one Mrs. E. Gotcher, to work more than ten hours in said laundry on said 4th day of September, A.D. 1905, contrary to the statutes in such cases made and provided, and against the peace and dignity of the state of Oregon."

A trial resulted in a verdict against the defendant, who was sentenced to pay a fine of \$10. The supreme court of the state affirmed the conviction (48 Or. 252, 85 Pac. 855), whereupon the case was brought here on writ of error.

The single question is the constitutionality of the statute under which the defendant was convicted, so far as it affects the work of a female in a laundry. That it does not conflict with any provisions of the state Constitution is settled by the decision of the supreme court of the state. The contentions of the defendant, now plaintiff in error, are thus stated in his brief:

"(1) Because the statute attempts to prevent persons *sui juris* from making their own contracts, and thus violates the provisions of the 14th Amendment, as follows:

"No state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any state deprive any person of life, liberty, or property, without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws."

"(2) Because the statute does not apply equally to all persons similarly situated, and is class legislation.

"(3) The statute is not a valid exercise of the police power. The kinds of work prescribed are not unlawful, nor are they declared to be immoral or dangerous to the public health; nor can such a law be sustained on the ground that it is designed to protect women on account of their sex. There is no necessary or reasonable connection between the limitation prescribed by the act and the public health, safety, or welfare."

It is the law of Oregon that women, whether married or single, have equal contractual and personal rights with men. As said by Chief Justice Wolverton, in *First Nat. Bank*

*v. Leonard*, 36 Or. 390, 396, 59 Pac. 873, 874, after a review of the various statutes of the state upon the subject:

"We may therefore say with perfect confidence that, with these three sections upon the statute book, the wife can deal, not only with her separate property, acquired from whatever source, in the same manner as her husband can with property belonging to him, but that she may make contracts and incur liabilities, and the same may be enforced against her, the same as if she were a *female sole*. There is now no residuum of civil disability resting upon her which is not recognized as existing against the husband. The current runs steadily and strongly in the direction of the emancipation of the wife, and the policy, as disclosed by all recent legislation upon the subject in the state, is to place her upon the same footing as if she were a *female sole*, not only with respect to her separate property, but as it affects her right to make binding contracts; and the most natural corollary to the situation is that the remedies for the enforcement of liabilities incurred are made coextensive and coequal with such enlarged conditions."

It thus appears that, putting to one side the elective franchise, in the matter of personal and contractual rights they stand on the same plane as the other sex. Their rights in these respects can no more be infringed than the equal rights of their brothers. We held in *Lonchner v. New York*, 198 U.S. 45, 49 L. ed. 937, 25 Sup. Ct. Rep. 539, that a law providing that no laborer shall be required or permitted to work in bakeries more than sixty hours in a week or ten hours in a day was not as to men a legitimate exercise of the police power of the state, but an unreasonable, unnecessary, and arbitrary interference with the right and liberty of the individual to contract in relation to his labor, and as such was in conflict with, and void under, the Federal Constitution. The decision is invoked by plaintiff in error as decisive of the question before us. But this assumes that the difference between the sexes does not justify a different rule respecting a restriction of the hours of labor.

In patent cases counsel are apt to open the argument with a discussion of the state of the art. It may not be amiss, in the present case, before examining the constitutional question, to notice the course of legislation, as well as expressions of opinion from other than judicial sources. In the brief filed by Mr. Louis D. Brandeis for the defendant in error is a very copious collection of all these matters, an epitome of which is found in the margin. . . .

While there have been but few decisions bearing directly upon the question, the following sustain the constitutionality of such legislation: *Com. v. Hamilton Mfg. Co.* 120 Mass. 383; *Wenham v. State*, 65 Neb. 394, 400, 406, 58 L.R.A. 825, 91 N. W. 421; *State v. Buchanan*, 29 Wash.

602, 59 L.R.A. 342, 92 Am. St. Rep. 930, 70 Pac. 52; *Com. v. Beatty*, 15 Pa. Super. Ct. 5, 17; against them is the case of *Ritchie v. People*, 155 Ill. 98, 29 L.R.A. 79, 46 Am. St. Rep. 315, 40 N.E. 454.

The legislation and opinions referred to in the margin may not be, technically speaking, authorities, and in them is little or no discussion of the constitutional question presented to us for determination, yet they are significant of a widespread belief that woman's physical structure, and the functions she performs in consequence thereof, justify special legislation restricting or qualifying the conditions under which she should be permitted to toil. Constitutional questions, it is true, are not settled by even a consensus of present public opinion, for it is the peculiar value of a written constitution that it places in unchanging form limitations upon legislative action, and thus gives a permanence and stability to popular government which otherwise would be lacking. At the same time, when a question of fact is debated and debatable, and the extent to which a special constitutional limitation goes is affected by the truth in respect to that fact, a widespread and long-continued belief concerning it is worthy of consideration. We take judicial cognizance of all matters of general knowledge.

It is undoubtedly true, as more than once declared by this court, that the general right to contract in relation to one's business is part of the liberty of the individual, protected by the 14th Amendment to the Federal Constitution; yet it is equally well settled that this liberty is not absolute and extending to all contracts, and that a state may, without conflicting with the provisions of the 14th Amendment, restrict in many respects the individual's power of contract. Without stopping to discuss at length the extent to which a state may act in this respect, we refer to the following cases in which the question has been considered: *Allgeyer v. Louisiana*, 165 U.S. 578, 41 L. ed. 832, 17 Sup. Ct. Rep. 427; *Holden v. Hardy*, 169 U. S. 366, 42 L. ed. 780, 18 Sup. Rep. 383; *Lochner v. New York*, *supra*.

That woman's physical structure and the performance of maternal functions place her at a disadvantage in the struggle for subsistence is obvious. This is especially true when the burdens of motherhood are upon her. Even when they are not, by abundant testimony of the medical fraternity continuance for a long time on her feet at work, repeating this from day to day, tends to injurious effects upon the body, and, as healthy mothers are essential to vigorous offspring, the physical well-being of woman becomes an object of public interest and care in order to preserve the strength and vigor of the race.

Still again, history discloses the fact that woman has always been dependent upon man. He established his control at the outset by superior physical strength, and this control in various forms, with diminishing intensity, has continued to the present. As minors, though not to the

same extent, she has been looked upon in the courts as needing especial care that her rights may be preserved. Education was long denied her, and while now the doors of the schoolroom are opened and her opportunities for acquiring knowledge are great, yet even with that and the consequent increase of capacity for business affairs it is still true that in the struggle for subsistence she is not an equal competitor with her brother. Though limitations upon personal and contractual rights may be removed by legislation, there is that in her disposition and habits of life which will operate against a full assertion of those rights. She will still be where some legislation to protect her seems necessary to secure a real equality of right. Doubtless there are individual exceptions, and there are many respects in which she has an advantage over him; but looking at it from the viewpoint of the effort to maintain an independent position in life, she is not upon an equality. Differentiated by these matters from the other sex, she is properly placed in a class by herself, and legislation designed for her protection may be sustained, even when like legislation is not necessary for men, and could not be sustained. It is impossible to close one's eyes to the fact that she still looks to her brother and depends upon him. Even though all restrictions on political, personal, and contractual rights were taken away, and she stood, so far as statutes are concerned, upon an absolutely equal plane with him, it would still be true that she is so constituted that she will rest upon and look to him for protection; that her physical structure and a proper discharge of her maternal functions—having in view not merely her own health, but the well-being of the race—justify legislation to protect her from the greed as well as the passion of man. The limitations which this statute places upon her contractual powers, upon her right to agree with her employer as to the time she shall labor, are not imposed solely for her benefit, but also largely for the benefit of all. Many words cannot make this plainer. The two sexes differ in structure of body, in the functions to be performed by each, in the amount of physical strength, in the capacity for long continued labor, particularly when done standing, the influence of vigorous health upon the future well-being of the race, the self-reliance which enables one to assert full rights, and in the capacity to maintain the struggle for subsistence. This difference justifies a difference in legislation, and upholds that which is designed to compensate for some of the burdens which rest upon her.

We have not referred in this discussion to the denial of the elective franchise in the state of Oregon, for while that may disclose a lack of political equality in all things with her brother, that is not of itself decisive. The reason runs deeper, and rests in the inherent difference between the two sexes, and in the different functions in life which they perform.

For these reasons, and without questioning in any respect the decision in *Lochner v. New York*, we are of the opinion that it cannot be adjudged that the act in question is in conflict with the Federal Constitution, so far as it respects the work of a female in a laundry, and the judgment of the Supreme Court of Oregon is affirmed.

### Why Women Should Vote By Jane Addams

Frances M. Bjrkman and Annie G. Porritt, eds., *"The Blue Book"; Woman Suffrage, History, Arguments and Results* (New York: National Woman Suffrage Publishing Co., 1937)

For many generations it has been believed that woman's place is within the walls of her own home, and it is indeed impossible to imagine the time when her duty there shall be ended or to forecast any social change which shall release her from that paramount obligation.

This paper is an attempt to show that many women today are failing to discharge their duties to their own households properly simply because they do not perceive that as society grows more complicated it is necessary that woman shall extend her sense of responsibility to many things outside of her own home if she would continue to preserve the home in its entirety. One could illustrate in many ways. A woman's simplest duty, one would say, is to keep her house clean and wholesome, and to feed her children properly. Yet if she lives in a tenement house, as so many of my neighbors do, she cannot fulfill these simple obligations by her own efforts because she is utterly dependent upon the city administration for the conditions which render decent living possible. Her basement will not be dry, her stairways will not be fireproof, her house will not be provided with sufficient windows to give light and air, nor will it be equipped with sanitary plumbing, unless the Public Works Department sends inspectors who constantly insist that these elementary decencies be provided. Women who live in the country sweep their own dooryards and may either feed the refuse of the table to a flock of chickens or allow it innocently to decay in the open air and sunshine. In a crowded city quarter, however, if the street is not cleaned by the city authorities, no amount of private sweeping will keep the tenement free from grime; if the garbage is not properly collected and destroyed, a tenement house mother may see her children sicken and die of diseases from which she alone is powerless to shield them, although her tenderness and devotion are unbounded. She cannot even secure untainted meat for her household, she cannot provide fresh fruit, unless the meat has been inspected by city officials, and the decayed fruit, which is so often placed upon sale in the tenement districts, has been destroyed in the interests

of public health. In short, if woman would keep on with her old business of caring for her house and rearing her children, she will have to have some conscience in regard to public affairs lying quite outside of her immediate household. The individual conscience and devotion are no longer effective.

Chicago one spring had a spreading contagion of scarlet fever just at the time that the school nurses had been discontinued because business men had pronounced them too expensive. If the women who sent their children to the schools had been sufficiently public-spirited and had been provided with an implement through which to express that public spirit, they would have insisted that the schools be supplied with nurses in order that their own children might be protected from contagion. In other words, if women would effectively continue their old avocations they must take part in the slow upbuilding of that code of legislation which is alone sufficient to protect the home from the dangers incident to modern life. One might instance the many deaths of children from contagious diseases the germs of which had been carried in tailored clothing. Country doctors testify as to the outbreak of scarlet fever in remote neighborhoods each autumn, after the children have begun to wear the winter overcoats and cloaks which have been sent from infected city sweatshops. That their mothers mend their stockings and guard them from "taking cold" is not a sufficient protection, when the tailoring of the family is done in a distant city under conditions which the mother cannot possibly control. The sanitary regulation of sweatshops by city officials is all that can be depended upon to prevent such needless destruction. Who shall say that women are not concerned in the enactment and enforcement of such legislation if they would preserve their homes?

Even women who take no part in public affairs, in order that they may give themselves entirely to their own families, sometimes going so far as to despise those other women who are endeavoring to secure protective legislation, may illustrate this point. The Hull-House neighborhood was at one time suffering from a typhoid epidemic. A careful investigation was made by which we were able to establish a very close connection between the typhoid and a mode of plumbing which made it most probable that the infection had been carried by flies. Among the people who had been exposed to the infection was a widow who had lived in the ward for a number of years, in a comfortable little house which she owned. Although the Italian immigrants were closing in all around her, she was not willing to sell her property and to move away, until she had finished the education of her children. In the meantime she held herself quite aloof from her Italian neighbors and could never be drawn into any of the public efforts to protect them by securing a better code of tenement house sanitation. Her

two daughters were sent to an Eastern college; one June, when one of them had graduated and the other still had two years before she took her degree, they came to the spotless little house, and to their self-sacrificing mother for the Summer's holidays. They both fell ill, not because their own home was not clean, not because their mother was not devoted, but because next door to them and also in the rear were wretched tenements, and because the mother's utmost efforts could not keep the infection out of her own house. One daughter died, and one recovered, but was an invalid for two years following. This is, perhaps, a fair illustration of the futility of the individual conscience when woman insists upon isolating her family from the rest of the community and its interests. The result is sure to be a pitiful failure.

One of the interesting experiences in the Chicago campaign for inducing the members of the Charter Convention to recommend municipal franchise for women in the provisions of the new charter was the unexpected enthusiasm and help which came from large groups of foreign-born women. The Scandinavian women represented in many Lutheran Church societies said quite simply that in the old country they had had the municipal franchise upon the same basis as men for many years; all the women living under the British Government, in England, Australia or Canada, pointed out that Chicago women were asking now for what the British women had long ago. But the most unexpected response came from the foreign colonies in which women had never heard such problems discussed, and took the prospect of the municipal ballot as a simple device—which it is—to aid them in their daily struggle with adverse city conditions. The Italian women said that the men engaged in railroad construction were away all summer and did not know anything about their household difficulties. Some of them came to Hull-House one day to talk over the possibility of a public wash-house. They do not like to wash in their own tenements; they had never seen a washing-tub until they came to America, and find it very difficult to use it in the restricted space of their little kitchens and to hang the clothes within the house to dry. They say that in the Italian villages the women all go to the streams together; in the town they go to the public wash-house; and washing, instead of being lonely and disagreeable, is made pleasant by cheerful conversation. It is asking a great deal of these women to change suddenly all their habits of living, and their contention that the tenement house kitchen is too small for laundry work is well taken. If women in Chicago knew the needs of the Italian colony they would realize that any change bringing cleanliness and fresh air into the Italian household would be a very sensible and hygienic measure. It is, perhaps, asking a great deal that the members of the City Council should understand this, but surely a comprehensive of the needs

of these women and efforts toward ameliorating their lot might be regarded as matters of municipal obligation on the part of voting women.

The same thing is true of the Jewish women in their desire for covered markets which have always been a municipal provision in Russia and Poland. The vegetables piled high upon the wagons standing in the open markets of Chicago become covered with dust and soot. It seems to these women a violation of the most rudimentary decencies and they sometimes say quite simply: "If women had anything to say about it they would change all that."

If women follow only the lines of their traditional activities, here are certain primary duties which belong to even the most conservative women, and which no one woman or group of women can adequately discharge unless they join the more general movements looking toward social amelioration through legal enactment.

The first of these, of which this article has already treated, is woman's responsibility for the members of her own household that they may be properly fed and clothed and surrounded by hygienic conditions. The second is a responsibility for the education of children: (a) that they may be provided with good books; (b) that they may be kept free from vicious influences on the street; (c) that when working they may be protected by adequate child-labor legislation.

(a) The duty of a woman toward the schools which her children attend is so obvious that it is not necessary to dwell upon it. But even this simple obligation cannot be effectively carried out without some form of social organization, as the mothers school clubs and mothers congresses testify, and to which the most conservative women belong because they feel the need of wider reading and discussion concerning the many problems of childhood. It is, therefore, perhaps natural that the public should have been more willing to accord a vote to women in school matters than in any other, and yet women have never been members of a Board of Education in sufficient numbers to influence largely actual school curricula. If they had been kindergartens, domestic science courses and school playgrounds would be far more numerous than they are. More than one woman has been convinced of the need of the ballot by the futility of her efforts in persuading a business man that young children need nurture in something besides the three r's. Perhaps, too, only women realize the influence which the school might exert upon the home if a proper adaptation to actual needs were considered. An Italian girl who has had lessons in cooking at the public school will help her mother to connect the entire family with American food and household habits. That the mother has never baked bread in Italy—only mixed it in her own house and then taken it out to the village oven—makes it all the more necessary that her daughter should understand the

complications of a cooking-stove. The same thing is true of the girl who learns to sew in the public school, and more than anything else, perhaps, of the girl who receives the first simple instruction in the care of little children, that skillful care which every tenement house baby requires if he is to be pulled through his second summer. The only time, to my knowledge, that lessons in the care of children were given in the public schools of Chicago was one summer when the vacation schools were being managed by a volunteer body of women. The instructions were eagerly received by the Italian girls, who had been "little mothers" to younger children ever since they could remember.

As a result of this teaching I recall a young girl who carefully explained to her Italian mother that the reason the babies in Italy were so healthy and the babies in Chicago were so sickly was not, as her mother had always firmly insisted, because her babies in Italy had goat's milk and her babies in America had cow's milk, but because the milk in Italy was clean and the milk in Chicago was dirty. She said that when you milked your own goat before the door you knew that the milk was clean, but when you bought milk from the grocery store after it had been carried for many miles in the country, "you couldn't tell whether or not it was fit for baby to drink until the men from the City Hall, who had watched it all the way, said that it was all right." She also informed her mother that the "City Hall wanted to fix up the milk so that it couldn't make the baby sick, but that they hadn't quite enough votes for it yet." The Italian mother believed what her child had been taught in the big school; it seemed to her quite as natural that the city should be concerned in providing pure milk for her younger children as that it should provide big schools and teachers for her older children. She reached this naive conclusion because she had never heard those arguments which make it seem reasonable that a woman should be given the school franchise, but no other.

(b) But women are also beginning to realize that children need attention outside of school hours; that much of the petty vice in cities is merely the love of pleasure gone wrong, the over-restrained boy or girl seeking improper recreation and excitement. It is obvious that a little study of the needs of children, a sympathetic understanding of the conditions under which they go astray, might save hundreds of them. Women traditionally have had an opportunity to observe the plays of children and the needs of youth, and yet in Chicago, at least, they had done singularly little in this vexed problem of juvenile delinquency until they helped to inaugurate the Juvenile Court movement a dozen years ago. The Juvenile Court Committee, made up largely of women, paid the salaries of the probation officers connected with the court for the first six years of its existence, and after the salaries were cared for by the county the same organization turned itself into a Juvenile Protec-

tive League, and through a score of paid officers are doing valiant service in minimizing some of the dangers of city life which boys and girls encounter.

This Protective League, however, was not formed until the women had had a civic training through their semi-official connection with the Juvenile Court. This is, perhaps, an illustration of our inability to see the duty "next to hand" until we have become alert through our knowledge of conditions in connection with the larger duties. We would all agree that social amelioration must come about through the efforts of many people who are moved thereto by the compunction and stirring of the individual conscience, but we are only beginning to understand that the individual conscience will respond to the special challenge largely in proportion as the individual is able to see the social conditions because he has felt responsible for their improvement. Because this body of women assumed a public responsibility they have seen to it that every series of pictures displayed in the five-cent theatre is subjected to a careful censorship before it is produced, and those series suggesting obscenity and criminality have been practically eliminated. The police department has performed this and many other duties to which it was oblivious before, simply because these women have made it realize that it is necessary to protect and purify those places of amusement which are crowded with young people every night. This is but the negative side of the policy pursued by the public authorities in the fifteen small parks of Chicago, each of which is provided with halls in which young people may meet nightly for social gatherings and dances. The more extensively the modern city endeavors on the one hand to control and on the other hand to provide recreational facilities for its young people, the more necessary it is that women should assist in their direction and extension. After all, a care for wholesome and innocent amusement is what women have for many years assumed. When the reaction comes on the part of taxpayers, women's votes may be necessary to keep the city to its beneficent obligations towards its own young people.

(c) As the education of her children has been more and more transferred to the school, so that even children four years old go to the kindergarten, the woman has been left in a household of constantly narrowing interests, not only because the children are away, but also because one industry after another is slipping from the household into the factory. Ever since steam power has been applied to the processes of weaving and spinning woman's traditional work has been carried on largely outside of the home. The clothing and household linen are not only spun and woven, but also usually sewed by machinery; the preparation of many foods has also passed into the factory and necessarily a certain number of women have been obliged to follow their work there; although it is doubtful, in spite of

the large number of factory girls, whether women now are doing as large a proportion of the world's work as they used to do. Because many thousands of those working in factories and shops are girls between the ages of fourteen and twenty-two, there is a necessity that older women should be interested in the conditions of industry. The very fact that these girls are not going to remain in industry permanently makes it more important that some one should see to it that they shall not be incapacitated for their future family life because they work for exhausting hours and under insanitary conditions.

If woman's sense of obligation had enlarged as the industrial condition changed, she might naturally and almost imperceptibly have inaugurated the movements for social amelioration in the line of factory legislation and shop sanitation. That she has not done so is doubtless due to the fact that her conscience is slow to recognize any obligation outside of her own family circle, and because she was so absorbed in her own household that she failed to see what the conditions outside actually were. It would be interesting to know how far the consciousness that she had no vote and could not change matters operated in this direction. After all, we see only those things to which our attention has been drawn, we feel responsibility for those things which are brought to us as matters of responsibility. If conscientious women were convinced that it was a civic duty to be informed in regard to these grave industrial affairs, and then to express the conclusions which they had reached by depositing a piece of paper in a ballot-box, one cannot imagine that they would shirk simply because the action ran counter to old traditions.

To those of my readers who would admit that, although woman has no right to shirk her old obligations, all of these measures could be secured more easily through her influence upon the men of her family than through the direct use of the ballot. I should like to tell a little story. I have a friend in Chicago who is the mother of four sons and the grandmother of twelve grandsons who are voters. She is a woman of wealth, of secured social position, of sterling character and clear intelligence, and may therefore, quite fairly be cited as a "woman of influence." Upon one of her recent birthdays, when she was asked how she had kept so young, she promptly replied: "Because I have always advocated at least one unpopular cause." It may have been in pursuance of this policy that for many years she has been an ardent advocate of free silver, although her manufacturing family are all Republicans. I happened to call at her house on the day that Mr. McKinley was elected President against Mr. Bryan for the first time. I found my friend much disturbed. She said somewhat bitterly that she had at last discovered what the much-vaunted influence of woman was worth; that she had implored each one of her sons and grandsons; had entered into endless arguments

and moral appeals to induce one of them to represent her convictions by voting for Mr. Bryan; that, although sincerely devoted to her, each one had assured her that his convictions forced him to vote the Republican ticket! She said that all she had been able to secure was the promise from one of the grandsons, for whom she had and especial tenderness, because he bore her husband's name, that he would not vote at all. He could not vote for Bryan, but out of respect for her feeling he would refrain from voting for McKinley. My friend said that for many years she had suspected that women could influence men only in regard to those things in which men were not deeply concerned, but when it came to persuading a man to a woman's views in affairs of politics or business it was absolutely useless. I contended that a woman had no right to persuade a man to vote against his own convictions; that I respected the men of her family for following their own judgment regardless of the appeal which the honored head of the house had made to their chivalric devotion. To this she replied that she would agree with that point of view when a woman had the same opportunity as a man to register her convictions by vote. I believed then as I do now, that nothing is gained when independence of judgment is assailed by "influence," sentimental or otherwise, and that we test advancing civilization somewhat by our power to respect differences and by our tolerance of another's honest conviction.

This is, perhaps, the attitude of many busy women who would be glad to use the ballot to further public measures in which they are interested and for which they have been working for years. It offends the taste of such a woman to be obliged to use indirect "influence" when she is accustomed to well-bred, open action in other affairs, and she very much resents the time spent in persuading a voter to take her point of view, and possibly to give up his own quite as honest and valuable as hers, although different because resulting from a totally different experience. Public-spirited women who wish to use the ballot, as I know them, do not wish to do the work of men nor to take over men's affairs. They simply want an opportunity to do their own work and to take care of those affairs which naturally and historically belong to women, but which are constantly being overlooked and slighted in our political institutions.

In a complex community like the modern city all points of view need to be represented; the resultants of diverse experiences need to be pooled, if the community would make for sane and balanced progress. If it would meet fairly each problem as it arises, whether it be connected with a freight tunnel having to do largely with business men, or with the increasing death rate among children under five years of age, a problem in which women are vitally concerned, or with the question of more adequate street-car transfers, in which both men and women might be said to

be equally interested, it must not ignore the judgments of its entire adult population.

To turn the administration of our civic affairs wholly over to men may mean that the American city will continue to push forward in its commercial and industrial development, and continue to lag behind in those things which make a city healthful and beautiful. After all, woman's traditional function has been to make her dwelling-place both clean and fair. Is that dreariness in city life, that lack of domesticity which the humblest farm dwelling presents, due to a withdrawal of one of the naturally co-operating forces? If women have in any sense been responsible for the gentler side of life which softens and blurs some of its harsher conditions, may they not have a duty to perform in our American cities?

In closing, may I recapitulate that if woman would fulfill her traditional responsibility to her own children; if she would educate and protect from danger factory children who must find their recreation on the street; if she would bring the cultural forces to bear upon our materialistic civilization; and if she would do it all with the dignity and directness fitting one who carries on her immemorial duties, then she must bring herself to the use of the ballot—that latest implement for self-government. May we not fairly say the American women need this implement in order to preserve the home?

### **"Make the World Safe for Democracy" Speech (1917)**

**President Woodrow Wilson**

Arthur S. Link, ed., *The Papers of Woodrow Wilson*,  
vol. 45 (Princeton, N.J.: Princeton University Press, 1966–  
94), pp. 519–527

April 2, 1917

Gentlemen of the Congress: I have called the Congress into extraordinary session because there are serious, very serious, choices of policy to be made, and made immediately, which it was neither right nor constitutionally permissible that I should assume the responsibility of making. On the third of February last I officially laid before you the extraordinary announcement of the Imperial German Government that on and after the first day of February it was its purpose to put aside all restraints of law or of humanity and use its submarines to sink every vessel that sought to approach either the ports of Great Britain and Ireland or the western coasts of Europe or any of the ports controlled by the enemies of Germany within the Mediterranean. That had seemed to be the object of the German submarine warfare earlier in the war, but since April of last year the Imperial Government had somewhat restrained

the commanders of its undersea craft in conformity with its promise then given to us that passenger boats should not be sunk and that due warning would be given to all other vessels which its submarines might seek to destroy, when no resistance was offered or escape attempted, and care taken that their crews were given at least a fair chance to save their lives in their open boats. The precautions taken were meagre and haphazard enough, as was proved in distressing instance after instance in the progress of the cruel and unmanly business, but a certain degree of restraint was observed. The new policy has swept every restriction aside. Vessels of every kind, whatever their flag, their character, their cargo, their destination, their errand, have been ruthlessly sent to the bottom without warning and without thought of help or mercy for those on board, the vessels of friendly neutrals along with those of belligerents. Even hospitals ships and ships carrying relief to the sorely bereaved and stricken people of Belgium, though the latter were provided with safe conduct through the proscribed areas by the German Government itself and were distinguished by unmistakable marks of identity, have been sunk with the same reckless lack of compassion or of principles. I was for a little while unable to believe that such things would in fact be done by any government that had hitherto subscribed to the humane practices of civilized nations.

International law had its origin in the attempt to set up some law which would be respected and observed upon the seas, where no nation had right of dominion and where lay the free highways of the world. By painful stage after stage has that law been built up, with meagre enough results, indeed, after all was accomplished that could be accomplished, but always with a clear view, at least, of what the heart and conscience of mankind demanded. This minimum of right the German Government has swept aside under the plea of retaliation and necessity and because it had no weapons which it could use at sea except these which it is impossible to employ as it is employing them without throwing to the winds all scruples of humanity or of respect for the understandings that were supposed to underlie the intercourse of the world. I am not now thinking of the loss of property involved, immense and serious as that is, but only of the wanton and wholesale destruction of the lives of non-combatants, men, women, and children, engaged in pursuits which have always, even in the darkest periods of modern history, been deemed innocent and legitimate. Property can be paid for; the lives of peaceful and innocent people cannot be. The present German submarine warfare against commerce is a warfare against mankind.

It is a war against all nations. American ships have been sunk, American lives taken, in ways which it has stirred us very deeply to learn of, but the ships and people of other neutral and friendly nations have been sunk and overwhelmed in the waters in the same way. There has been

no discrimination. The challenge is to all mankind. Each nation must decide for itself how it will meet it. The choice we make for ourselves must be made with a moderation of counsel and a temperateness of judgment befitting our character and our motives as a nation. We must put excited feeling away. Our motive will not be revenge or the victorious assertion of the physical might of the nation, but only the vindication of right, of human right, of which we are only a single champion.

When I addressed the Congress on the twenty-sixth of February last I thought that it would suffice to assert our neutral rights with arms, our right to use the seas against unlawful interference, our right to keep our people safe against unlawful violence. But armed neutrality, it now appears, is impracticable. Because submarines are in effect outlaws when used as the German submarines have been used against merchant shipping, it is impossible to defend ships against their attacks as the law of nations has assumed that merchantmen would defend themselves against privateers or cruisers, visible craft giving chase upon the open sea. It is common prudence in such circumstances, grim necessity, indeed, to endeavour to destroy them before they have shown their own intention. They must be dealt with upon sight, if dealt with at all. The German Government denies the right of neutrals to use arms at all within the areas of the sea which it has proscribed, even in the defense or rights which no modern publicist has ever before questioned their right to defend. The intimation is conveyed that the armed guards which we have placed on our merchant ships will be treated as beyond the pale of law and subject to be dealt with as pirates would be. Armed neutrality is ineffectual enough at best; in such circumstances and in the face of such pretensions it is worse than ineffectual: it is likely only to produce what it was meant to prevent; it is practically certain to draw us into the war without either the rights or the effectiveness of belligerents. There is one choice we cannot make, we are incapable of making; we will not choose the path of submission and suffer the most sacred rights of our nation and our people to be ignored or violated. The wrongs against which we now array ourselves are no common wrongs; they cut to the very roots of human life.

With a profound sense of the solemn and even tragical character of the step I am taking and of the grave responsibilities which it involves, but in unhesitating obedience to what I deem my constitutional duty, I advise that the Congress declare the recent course of the Imperial German Government to be in fact nothing less than war against the government and people of the United States; that it formally accept the status of belligerent which has thus been thrust upon it; and that it take immediate steps not only to put the country in a more thorough state of defense but also to exert all its power and employ all its resources to

bring the Government of the German Empire to terms and end the war.

What this will involve is clear. It will involve the utmost practicable cooperation in counsel and action with the governments now at war with Germany, and, as incident to that, the extension to those governments of the most liberal financial credits, in order that our resources may so far as possible be added to theirs. It will involve the organization and mobilization of all the material resources of the country to supply the materials of war and serve the incidental needs of the nation in the most abundant and yet the most economical and efficient way possible. It will involve the immediate full equipment of the navy in all respects but particularly in supplying it with the best means of dealing with the enemy's submarines. It will involve the immediate addition to the armed forces of the United States already provided for by law in case of war at least five hundred thousand men, who should, in my opinion, be chosen upon the principle of universal liability to service, and also the authorization of subsequent additional increments of equal force so soon as they may be needed and can be handled in training. It will involve also, of course, the granting of adequate credits to the Government, sustained, I hope, so far as they can equitably be sustained by the present generation, by well conceived taxation.

I say sustained so far as may be equitable by taxation because it seems to me that it would be most unwise to base the credits which will now be necessary entirely on money borrowed. It is our duty, I most respectfully urge, to protect our people so far as we may against the very serious hardships and evils which would be likely to arise out of the inflation which would be produced by vast loans.

In carrying out the measures by which these things are to be accomplished we should keep constantly in mind the wisdom of interfering as little as possible in our own preparation and in the equipment of our own military forces with the duty,—for it will be a very practical duty,—of supplying the nations already at war with Germany with the materials which they can obtain only from us or by our assistance. They are in the field and we should help them in every way to be effective there.

I shall take the liberty of suggesting, through the several executive departments of the Government, for the consideration of your committees, measures for the accomplishment of the several objects I have mentioned. I hope that it will be your pleasure to deal with them as having been framed after very careful thought by the branch of the Government upon which the responsibility of conducting the war and safeguarding the nation will most directly fall. While we do these things, these deeply momentous things, let us be very clear, and make very clear to all the world what our motives and our objects are. My own thought has not been driven from its habitual and normal course by the

unhappy events of the last two months, and I do not believe that the thought of the nation has been altered or clouded by them. I have exactly the same things in mind now that I had in mind when I addressed the Senate on the twenty-second of January last; the same that I had in mind when I addressed the Congress on the third of February and on the twenty-sixth of February. Our object now, as then, is to vindicate the principles of peace and justice in the life of the world as against selfish and autocratic power and to set up amongst the really free and self-governed peoples of the world such a concert of purpose and of action as will henceforth ensure the observance of those principles. Neutrality is no longer feasible or desirable where the peace of the world is involved and the freedom of its peoples, and the menace to that peace and freedom lies in the existence of autocratic governments backed by organized force which is controlled wholly by their will, not by the will of their people. We have seen the last of neutrality in such circumstances. We are at the beginning of an age in which it will be insisted that the same standards of conduct and of responsibility for wrong done shall be observed among nations and their governments that are observed among the individual citizens of civilized states.

We have no quarrel with the German people. We have no feeling towards them but one of sympathy and friendship. It was not upon their impulse that their government acted in entering this war. It was not with their previous knowledge or approval. It was a war determined upon as wars used to be determined upon in the old, unhappy days when peoples were nowhere consulted by their rulers and wars were provoked and waged in the interest of dynasties or of little groups of ambitious men who were accustomed to use their fellow men as pawns and tools. Self-governed nations do not fill their neighbour states with spies or set the course of intrigue to bring about some critical posture of affairs which will give them an opportunity to strike and make conquest. Such designs can be successfully worked out only under cover and where no one has the right to ask questions. Cunningly contrived plans of deception or aggression, carried, it may be, from generation to generation, can be worked out and kept from the light only within the privacy of courts or behind the carefully guarded confidences of a narrow and privileged class. They are happily impossible where public opinion commands and insists upon full information concerning all the nation's affairs.

A steadfast concert for peace can never be maintained except by a partnership of democratic nations. No autocratic government could be trusted to keep faith within it or observe its covenants. It must be a league of honour, a partnership of opinion. Intrigue would eat its vitals away; the plottings of inner circles who could plan what they would and render account to no one would be a corruption seated at its very heart. Only free peoples can hold

their purpose and their honour steady to a common end and prefer the interests of mankind to any narrow interest of their own.

Does not every American feel that assurance has been added to our hope for the future peace of the world by the wonderful and heartening things that have been happening within the last few weeks in Russia? Russia was known by those who knew it best to have been always in fact democratic at heart, in all the vital habits of her thought, in all the intimate relationships of her people that spoke their natural instinct, their habitual attitude towards life. The autocracy that crowned the summit of her political structure, long as it had stood and terrible as was the reality of its power, was not in fact Russian in origin, character, or purpose; and now it has been shaken off and the great, generous Russian people have been added in all their naive majesty and might to the forces that are fighting for freedom in the world, for justice, and for peace. Here is a fit partner for a League of Honour.

One of the things that has served to convince us that the Prussian autocracy was not and could never be our friend is that from the very outset of the present war it has filled our unsuspecting communities and even our offices of government with spies and set criminal intrigues everywhere afoot against our national unity of counsel, our peace within and without, our industries and our commerce. Indeed it is now evident that its spies were here even before the war began; and it is unhappily not a matter of conjecture but a fact proved in our court of justice that the intrigues which have more than once come perilously near to disturbing the peace and dislocating the industries of the country have been carried on at the instigation, with the support, and even under the personal direction of official agents of the Imperial Government accredited to the Government of the United States. Even in checking these things and trying to extirpate them we have sought to put the most generous interpretation possible upon them because we knew that their source lay, not in any hostile feeling or purpose of the German people towards us (who were, no doubt as ignorant of them as we ourselves were), but only in the selfish designs of a Government that did what it pleased and told its people nothing. But they have played their part in serving to convince us at last that that Government entertains no real friendship for us and means to act against our peace and security at its convenience. That it means to stir up enemies against us at our very doors the intercepted note to the German Minister at Mexico City is eloquent evidence.

We are accepting this challenge of hostile purpose because we know that in such a government, following such methods, we can never have a friend; and that in the presence of its organized power, always lying in wait to accomplish we know not what purpose, there can be no assured

security for the democratic governments of the world. We are now about to accept gauge of battle with this natural foe to liberty and shall, if necessary, spend the whole force of the nation to check and nullify its pretensions and its power. We are glad, now that we see the facts with no veil of false pretence about them, to fight thus for the ultimate peace of the world and for the liberation of its peoples, the German peoples included: for the rights of nations great and small and the privilege of men everywhere to choose their way of life and of obedience. The world must be made safe for democracy. Its peace must be planted upon the tested foundations of political liberty. We have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make. We are but one of the champions of the rights of mankind. We shall be satisfied when those rights have been made as secure as the faith and the freedom of nations can make them. Just because we fight without rancour and without selfish object, seeking nothing for ourselves but what we shall wish to share with all free peoples, we shall, I feel confident, conduct our operations as belligerents without passion and ourselves observe with proud punctilio the principles of right and of fair play we profess to be fighting for.

I have said nothing of the governments allied with the Imperial Government of Germany because they have not made war upon us or challenged us to defend our right and our honour. The Austro-Hungarian Government has, indeed, avowed its unqualified endorsement and acceptance of the reckless and lawless submarine warfare adopted now without disguise by the Imperial German Government, and it has therefore not been possible for this Government to receive Count Tarnowski, the Ambassador recently accredited to this Government by the Imperial and Royal Government of Austria-Hungary; but that Government has not actually engaged in warfare against citizens of the United States on the seas, and I take the liberty, for the present at least, of postponing a discussion of our relations with the authorities at Vienna. We enter this war only where we are clearly forced into it because there are no other means of defending our rights. It will be all the easier for us to conduct ourselves as belligerents in a high spirit of right and fairness because we act without animus, not in enmity towards a people or with the desire to bring any injury or disadvantage upon them, but only in armed opposition to an irresponsible government which has thrown aside all considerations of humanity and of right and is running amuck. We are, let me say again, the sincere friends of the German people, and shall desire nothing so much as the early re-establishment of intimate relations of mutual advantage between us,—however hard it may be for them, for the time being, to believe that this is spoken from our hearts. We have borne with their present gov-

ernment through all these bitter months because of that friendship,—exercising a patience and forbearance which would otherwise have been impossible. We shall, happily, still have an opportunity to prove that friendship in our daily attitude and actions towards the millions of men and women of German birth and native sympathy who live amongst us and share our life, and we shall be proud to prove it towards all who are in fact loyal to their neighbours and to the Government in the hour of test. They are, most of them, as true and loyal Americans as if they had never known any other fealty or allegiance. They will be prompt to stand with us in rebuking and restraining the few who may be of a different mind and purpose. If there should be disloyalty, it will be dealt with with a firm hand of stern repression; but, if it lifts its head at all, it will lift it only here and there and without countenance except from a lawless and malignant few.

It is a distressing and oppressive duty, Gentlemen of the Congress, which I have performed in thus addressing you. There are, it may be, many months of fiery trial and sacrifice ahead of us. It is a fearful thing to lead this great peaceful people into war, into the most terrible and disastrous of all wars, civilization itself seeming to be in the balance. But the right is more precious than peace, and we shall fight for the things which we have always carried nearest our hearts,—for democracy, for the right of those who submit to authority to have a voice in their own governments, for the rights and liberties of small nations, for a universal dominion of right by such a concert of free peoples as shall bring peace and safety to all nations and make the world itself at last free. To such a task we can dedicate our lives and our fortunes, everything that we are and everything that we have, with the pride of those who know that the day has come when America is privileged to spend her blood and her might for the principles that gave her birth and happiness and the peace which she has treasured. God helping her, she can do no other.

### President Wilson's "Fourteen Points" Speech, 1918

Arthur S. Link, ed., *The Papers of Woodrow Wilson*,  
vol. 45 (Princeton, N.J.: Princeton University Press,  
1966–94), pp. 534–539

#### Fourteen Points

Gentlemen of the Congress: Once more, as repeatedly before, the spokesmen of the Central Empires have indicated their desire to discuss the objects of the war and the possible bases of a general peace. Parleys have been in progress at Brest-Litovsk between representatives of the Central Powers, to which the attention of all the belligerents has been invited for the purpose of ascertaining whether it may be possible to extend these parleys into

a general conference with regard to terms of peace and settlement. The Russian representatives presented not only a perfectly definite statement of the principles upon which they would be willing to conclude peace, but also an equally definite programme of the concrete application of those principles. The representatives of the Central Powers, on their part, presented an outline of settlement which, if much less definite, seemed susceptible of liberal interpretation until their specific programme of practical terms was added. That programme proposed no concessions at all either to the sovereignty of Russia or to the preferences of the populations with whose fortunes it dealt, but meant, in a word, that the Central Empires were to keep every foot of territory their armed forces had occupied,—every province, every city, every point of vantage,—as a permanent addition to their territories and their power. It is a reasonable conjecture that the general principles of settlement which they at first suggested originated with the more liberal statesmen of Germany and Austria, the men who have begun to feel the force of their own peoples' thought and purpose, while the concrete terms of actual settlement came from the military leaders who have no thought but to keep what they have got. The negotiations have been broken off. The Russian representatives were sincere and in earnest. They cannot entertain such proposals of conquest and domination.

The whole incident is full of significance. It is also full of perplexity. With whom are the Russian representatives dealing? For whom are the representatives of the Central Empires speaking? Are they speaking for the majorities of their respective parliaments or for the minority parties, that military and imperialistic minority which has so far dominated their whole policy and controlled the affairs of Turkey and of the Balkan states which have felt obliged to become their associates in this war? The Russian representatives have insisted, very justly, very wisely, and in the true spirit of modern democracy, that the conferences they have been holding with the Teutonic and Turkish statesmen should be held within open, not closed doors, and all the world has been audience, as was desired. To whom have we been listening, then? To those who speak the spirit and intention of the Resolutions of the German Reichstag of the ninth of July last, the spirit and intention of the liberal leaders and parties of Germany, or to those who resist and defy that spirit and intention and insist upon conquest and subjugation? Or are we listening, in fact, to both, unreconciled and in open and hopeless contradiction? These are very serious and pregnant questions. Upon the answer to them depends the peace of the world.

But, whatever the results of the parleys at Brest-Litovsk, whatever the confusions of counsel and of purpose in the utterances of the spokesmen of the Central Empires, they have again attempted to acquaint the world with their

objects in the war and have again challenged their adversaries to say what their objects are and what sort of settlement they would deem just and satisfactory. There is no good reason why that challenge should not be responded to, and responded to with the utmost candor. We did not wait for it. Not once, but again and again, we have laid our whole thought and purpose before the world, not in general terms only, but each time with sufficient definition to make it clear what sort of definitive terms of settlement must necessarily spring out of them. Within the last week Mr. Lloyd George has spoken with admirable candor and in admirable spirit for the people and Government of Great Britain. There is no confusion of counsel among the adversaries of the Central Powers, no uncertainty of principle, no vagueness of detail. The only secrecy of counsel, the only lack of fearless frankness, the only failure to make definite statement of the objects of the war, lies with Germany and her Allies. The issues of life and death hang upon these definitions. No statesman who has the least conception of his responsibility ought for a moment to permit himself to continue this tragical and appalling outpouring of blood and treasure unless he is sure beyond a peradventure that the objects of the vital sacrifice are part and parcel of the very life of Society and that the people for whom he speaks think them right and imperative as he does. There is, moreover, a voice calling for these definitions of principle and of purpose which is, it seems to me, more thrilling and more compelling than any of the many moving voices with which the troubled air of the world is filled. It is the voice of the Russian people. They are prostrate and all but helpless, it would seem, before the grim power of Germany, which has hitherto known no relenting and no pity. Their power, apparently, is shattered. And yet their soul is not subservient. They will not yield either in principle or in action. Their conception of what is right, of what is humane and honorable for them to accept, has been stated with a frankness, a largeness of view, a generosity of spirit, and a universal human sympathy which must challenge the admiration of every friend of mankind; and they have refused to compound their ideals or desert others that they themselves may be safe. They call to us to say what it is that we desire, in what, if in anything, our purpose and our spirit differ from theirs; and I believe that the people of the United States would wish me to respond, with utter simplicity and frankness. Whether their present leaders believe it or not, it is our heartfelt desire and hope that some way may be opened whereby we may be privileged to assist the people of Russia to attain their utmost hope of liberty and ordered peace.

It will be our wish and purpose that the processes of peace, when they are begun, shall be absolutely open and that they shall involve and permit henceforth no secret understandings of any kind. The day of conquest and aggrandizement is gone by; so is also the day of secret

covenants entered into the interest of particular governments and likely at some unlooked-for moment to upset the peace of the world. It is this happy fact, now clear to the view of every public man whose thoughts do not still linger in an age that is dead and gone, which makes it possible for every nation whose purposes are consistent with justice and the peace of the world to avow now or at any other time the objects it has in view.

We entered this war because violations of right had occurred which touched us to the quick and made the life of our own people impossible unless they were corrected and the world secured once for all against their recurrence. What we demand in this war, therefore, is nothing peculiar to ourselves. It is that the world be made fit and safe to live in; and particularly that it be made safe for every peace-loving nation which, like our own, wishes to live its own life, determine its own institutions, be assured of justice and fair dealing by the other peoples of the world as against force and selfish aggression. All the peoples of the world are in effect partners in this interest, and for our own part we see very clearly that unless justice be done to others it will not be done to us. The programme of the world's peace, therefore, is our programme; and that programme, the only possible programme, as we see it, is this:

I. Open covenants of peace, openly arrived at, after which there shall be no private international understandings of any kind but diplomacy shall proceed always frankly and in the public view.

II. Absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.

III. The removal, so far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.

IV. Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.

V. A free, open-minded, and absolutely impartial adjustment of all colonial claims, based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal weight with the equitable claims of the government whose title is to be determined.

VI. The evacuation of all Russian territory and such a settlement of all questions affecting Russia as will secure the best and freest and cooperation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy and assure her of a sincere welcome into the society of free nations under institutions of her own choosing; and, more

than a welcome, assistance also of every kind that she may need and may herself desire. The treatment accorded Russia by her sister nations in the months to come will be the acid test of their good will, of their comprehension of her needs as distinguished from their own interests, and of their intelligent and unselfish sympathy.

VII. Belgium, the whole world will agree, must be evacuated and restored, without any attempt to limit the sovereignty which she enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is forever impaired.

VIII. All French territory should be freed and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which has unsettled the peace of the world for nearly fifty years, should be righted, in order that peace may once more be made secure in the interests of all.

IX. A readjustment of the frontiers of Italy should be effected along clearly recognizable lines of nationality.

X. The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.

XI. Rumania, Serbia, and Montenegro should be evacuated; occupied territories restored; Serbia accorded free and secure access to the sea; and the relations of the several Balkan states to one another determined by friendly counsel along historically established lines of allegiance and nationality; and international guarantees of the political and economic independence and territorial integrity of the several Balkan states should be entered into.

XII. The Turkish portions of the present Ottoman Empire should be assured a secure sovereignty but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

XIII. An independent Polish state should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

XIV. A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small states alike.

In regard to these essential rectifications of wrong and assertions of right we feel ourselves to be intimate partners of all the governments and peoples associated together against the Imperialists. We cannot be separated in interest or divided in purpose. We stand together until the end.

For such arrangements and covenants we are willing to fight and to continue to fight until they are achieved; but only because we wish the right to prevail and desire a just and stable peace such as can be secured only by removing the chief provocations to war, which this programme does remove. We have no jealousy of German greatness, and there is nothing in this programme that impairs it. We grudge her no achievement or distinction of learning or of pacific enterprise such as have made her record very bright and very enviable. We do not wish to injure her or to block in any way her legitimate influence or power. We do not wish to fight her either with arms or with hostile arrangements of trade if she is willing to associate herself with us and the other peace-loving nations of the world in covenants of justice and law and fair dealing. We wish her only to accept a place of equality among the peoples of the world,—the new world in which we now live,—instead of a place of mastery.

Neither do we presume to suggest to her any alteration or modification of her institutions. But it is necessary, we must frankly say, and necessary as a preliminary to any intelligent dealings with her on our part, that we should know whom her spokesmen speak for when they speak to us, whether for the Reichstag majority or for the military party and the men whose creed is imperial domination. We have spoken now, surely, in terms too concrete to admit of any further doubt or question. An evident principle runs through the whole programme I have outlined. It is the principle of justice to all peoples and nationalities, and their right to live on equal terms of liberty and safely with one another, whether they be strong or weak. Unless this principle be made its foundation no part of the structure of international justice can stand. The people of the United States could act upon no other principle; and to the vindication of this principle they are ready to devote their lives, their honor, and everything that they possess. The normal climax of this the culminating and final war for human liberty has come, and they are ready to put their own strength, their own highest purpose, their own integrity and devotion to the test.

### Flapper Jane by Bruce Bliven

The following article by Bruce Bliven appeared in *The New Republic* on September 9, 1925:

Jane's a flapper. That is a quaint, old-fashioned term, but I hope you remember its meaning. As you can tell by her

appellation, Jane is 19. If she were 29, she would be Dorothy; 39, Doris; 49, Elaine; 59, Jane again—and so on around. This Jane, being 19, is a flapper, through she urgently denies that she is a member of the younger generation. The younger generation, she will tell you, is aged 15 to 17; and she professes to be decidedly shocked at the things they do and say. That is a fact which would interest her minister, if he knew it—poor man, he knows so little! For he regards Jane as a perfectly horrible example of wild youth—paint, cigarettes, cocktails, petting parties—Moooh! Yet if the younger generation shocks her as she says, query: how wild is Jane? Before we come to this exciting question, let us take a look at the young person as she strolls across the lawn of her parents' suburban home, having just put the car away after driving sixty miles in two hours. She is, for one thing, a very pretty girl. Beauty is the fashion in 1925. She is frankly, heavily made up, not to imitate nature, but for an altogether artificial effect—pallor mortis, poisonously scarlet lips, richly ringed eyes—the latter looking not so much debauched (which is the intention) as diabetic. Her walk duplicates the swagger supposed by innocent America to go with the female half of a Paris Apache dance. And there are, finally, her clothes. These were estimated the other day by some statistician to weigh two pounds. Probably a libel; I doubt they come within half a pound of such bulk. Jane isn't wearing much, this summer. If you'd like to know exactly, it is: one dress, one step-in, two stockings, two shoes.

A step-in, if you are 99 and 44/100ths percent ignorant, is underwear—one piece, light, exceedingly brief but roomy. Her dress, as you can't possibly help knowing if you have even one good eye, and get around at all outside the Old People's Home, is also brief. It is cut low where it might be high, and vice versa. The skirt comes just an inch below her knees, overlapping by a faint fraction her rolled and twisted stockings. The idea is that when she walks in a bit of a breeze, you shall now and then observe the knee (which is not rouged—that's just newspaper talk) but always in an accidental, Venus-surprised-at-the-bath sort of way. This is a bit of coyness which hardly fits in with Jane's general character.

Jane's haircut is also abbreviated. She wears of course the very newest thing in bobs, even closer than last year's shingle. It leaves her just about no hair at all in the back, and 20 percent more than that in the front—about as much as is being worn this season by a cellist (male); less than a pianist; and much, much less than a violinist. Because of this new style, one can confirm a rumor heard last year: Jane has ears.

The corset is as dead as the dodo's grandfather; no feeble publicity pipings by the manufacturers, or calling it a "clasp around" will enable it, as Jane says, to "do a Lazarus." The petticoat is even more defunct. Not even a snicker can be raised by telling Jane that once the nation

was shattered to its foundations by the shadow-skirt. The brassiere has been abandoned, since 1924. While stockings are usually worn, they are not a sine-qua-nothing-doing. In hot weather Jane reserves the right to discard them, just as all the chorus girls did in 1923. As stockings are only a frantic, successful attempt to duplicate the color and texture of Jane's own sunburned slim legs, few but expert boulevardiers can tell the difference.

These which I have described are Jane's clothes, but they are not merely a flapper uniform. They are *The Style*, Summer of 1925 Eastern Seaboard. These things and none other are being worn by all of Jane's sisters and her cousins and her aunts. They are being worn by ladies who are three times Jane's age, and look ten years older; by those twice her age who look a hundred years older. Their use is so universal that in our larger cities the baggage transfer companies one and all declare they are being forced into bankruptcy. Ladies who used to go away for the summer with six trunks can now pack twenty dainty costumes in a bag.

Not since 1820 has feminine apparel been so frankly abbreviated as at present; and never, on this side of the Atlantic, until you go back to the little summer frocks of Pocahontas. This year's styles have gone quite a long step toward genuine nudity. Nor is this merely the sensible half of the population dressing as everyone ought to, in hot weather. Last winter's styles weren't so dissimilar, except that they were covered up by fur coats and you got the full effect only indoors. And improper costumes never have their full force unless worn on the street. Next year's styles, from all one hears, will be, as they already are on the continent, even *More So*.

Our great mentor has failed us: you will see none of the really up-to-date styles in the movies. For old-fashioned, conservative and dowdy dressing, go and watch the latest production featuring Bebe, Gloria or Pola. Under vigilant father Hays the ensilvered screen daren't reveal a costume equal to scores on Fifth Avenue, Broadway—or Wall Street.

Wall Street, by the way, is the one spot in which the New Nakedness seems most appropriate. Where men's simple passions have the lowest boiling point; where the lust for possession is most frankly, brazenly revealed and indeed dominates the whole diurnal round—in such a place there is a high appropriateness in the fact that the priestesses in the temple of Mammon, though their service be no more than file clerk or stenographer, should be thus Dionysiac in apparelling themselves for their daily tasks.

Where will it all end? do you ask, thumbing the page ahead in an effort to know the worst. Apologetically I reply that no one can say where it will end. Nudity has been the custom of many countries and over long periods of time. No one who has read history can be very firm in saying that *It Never Can Happen Again*. We may of course mutter, in feeble tones of hope, that our climate is not propitious.

Few any more are so naive as not to realize that there are fashions in morals and that these have a limitless capacity for modification. Costume, of course, is *A Moral*. You can get a rough measure of our movement if you look at the history of the theatre and see how the tidemark of tolerance has risen. For instance:

- 1904—Performance of “Mrs. Warren’s Profession” is halted by police.
- 1919—“Mrs. Warren” O. K. Town roused to frenzy by “Aphrodite,” in which one chorus girl is exposed for one minute in dim light and a union suit.
- 1923—Union suit O. K. Self-appointed censors have conniption fits over chorus girls naked from the waist up.
- 1925—Nudity from waist up taken for granted. Excitement caused by show in which girls wear only fig leaves.

Plotting the curve of tolerance and projecting it into the future, it is thus easy to see that complete nudity in the theatre will be reached on March 12, 1927. Just what will the appalling consequences be?

Perhaps about what they have been in the theatres of several European capitals, where such displays have long been familiar. Those who are interested in that sort of thing will go. Others will abstain.

At this point Billy Sunday, discussing this theme, would certainly drop into anecdotage. Were we to do the same, we might see Jane on the sun porch talking to a mixed group of her mother's week-end guests. “Jane,” says one, “I hear you cut yourself in bathing.”

“I’ll say I did,” comes crisply back. “Look!” She lifts her skirt three or four inches, revealing both brown knees, and above one of them a half-healed deep scratch. Proper murmurs of sympathy. From one quarter a chilly silence which draws our attention to the enpurpled countenance of a lady guest in the throes of what Eddie Cantor calls “the sex complex.” Jane's knees have thrown her all a-twitter; and mistaking the character of her emotion she thinks it is justified indignation. She is glad to display it openly for the reproof thereby administered.

“Well, damn it,” says Jane, in a subsequent private moment, “anybody who can’t stand a knee or two, nowadays, might as well quit. And besides, she goes to the beaches and never turns a hair.”

Here is a real point. The recent history of the Great Disrobing Movement can be checked up in another way by looking at the bathing costumes which have been accepted without question at successive intervals. There are still a few beaches near New York City which insist on more clothes than anyone can safely swim in, and thereby help to drown several young women each year. But in most places—universally in the West—a girl is now compelled to wear no more than is a man. The enpurpled one, to be

consistent, ought to have apoplexy every time she goes to the shore. But as Jane observes, she doesn't.

"Jane," say I, "I am a reporter representing American inquisitiveness. Why do all of you dress the way you do?"

"I don't know," says Jane. This reply means nothing: it is just the device by which the younger generation gains time to think. Almost at once she adds:

"The old girls are doing it because youth is. Everybody wants to be young, now—though they want all us young people to be something else. Funny, isn't it?"

"In a way," says Jane, "it's just honesty. Women have come down off the pedestal lately. They are tired of this mysterious-feminine-charm stuff. Maybe it goes with independence, earning your own living and voting and all that. There was always a bit of the harem in that coverup-your-arms-and-legs business, don't you think?"

"Women still want to be loved," goes on Jane, warming to her theme, "but they want it on a 50-50 basis, which includes being admired for the qualities they really possess. Dragging in this strange-allurement stuff doesn't seem sporting. It's like cheating in games, or lying."

"Ask me, did the War start all this?" says Jane helpfully.

"The answer is, how do I know? How does anybody know?"

"I read this book whaddaya-call-it by Rose Macaulay, and she showed where they'd been excited about wild youth for three generations anyhow—since 1870. I have a hunch maybe they've always been excited.

"Somebody wrote in a magazine how the War had upset the balance of the sexes in Europe and the girls over there were wearing the new styles as part of the competition for husbands. Sounds like the bunk to me. If you wanted to nail a man for life I think you'd do better to go in for the old-fashioned line: 'March' me to the altar, esteemed sir, before you learn whether I have limbs or not."

"Of course, not so many girls are looking for a life mealticket nowadays. Lots of them prefer to earn their own living and omit the home-and-baby act. Well, anyhow, postpone it years and years. They think a bachelor girl can and should do everything a bachelor man does." "It's funny," says Jane, "that just when women's clothes are getting scanty, men's should be going the other way. Look at the Oxford trousers!—as though a man had been caught by the ankles in a flannel quicksand."

Do the morals go with the clothes? Or the clothes with the morals? Or are they independent? These are questions I have not ventured to put to Jane, knowing that her answer would be "so's your old man." Generally speaking, however, it is safe to say that as regards the wildness of youth there is a good deal more smoke than fire. Anyhow, the new Era of Undressing, as already suggested, has spread far beyond the boundaries of Jane's group. The fashion is followed by

hordes of unquestionably monogamous matrons, including many who join heartily in the general ululations as to what young people are coming to. Attempts to link the new freedom with prohibition, with the automobile, the decline of Fundamentalism, are certainly without foundation. These may be accessory, and indeed almost certainly are, but only after the fact. That fact is, as Jane says, that women to-day are shaking off the shreds and patches of their age-old servitude. "Feminism" has won a victory so nearly complete that we have even forgotten the fierce challenge which once inhered in the very word. Women have highly resolved that they are just as good as men, and intend to be treated so. They don't mean to have any more unwanted children. They don't intend to be debarred from any profession or occupation which they choose to enter. They clearly mean (even though not all of them yet realize it) that in the great game of sexual selection they shall no longer be forced to play the role, simulated or real, of helpless quarry. If they want to wear their heads shaven, as a symbol of defiance against the former fate which for three millenia forced them to dress their heavy locks according to male decrees, they will have their way. If they should elect to go naked nothing is more certain than that naked they will go, while from the sidelines to which he has been relegated mere man is vouchsafed permission only to pipe a feeble Hurrah!

Hurrah!

### "Children's Era" Speech (1926)

**Margaret Sanger**

James Andrews, ed., *American Voices, Significant Speeches in American History, 1640–1945* (New York: Longman, 1989), pp. 429–432

Mr. Chairman, Ladies and Gentlemen: My subject is "The Children's Era." The Children's Era! This makes me think of Ellen Key's book—*The Century of the Child*. Ellen Key hoped that this twentieth century was to be the century of the child. The twentieth century, she said, would see this old world of ours converted into a beautiful garden of children. Well, we have already lived through a quarter of this twentieth century. What steps have we taken toward making it the century of the child? So far, very, very few.

Why does the Children's Era still remain a dream of the dim and the distant future? Why has so little been accomplished?—in spite of all our acknowledged love of children, all our generosity, all our good-will, all the enormous sending of millions on philanthropy and charities, all our warm-hearted sentiment, all our incessant activity and social consciousness? Why?

Before you can cultivate a garden, you must know something about gardening. You have got to give your seeds

a proper soil in which to grow. You have got to give them sunlight and fresh air. You have got to give them space and the opportunity (if they are to lift their flowers to the sun), to strike their roots deep into that soil. And always—do not forget this—you have got to fight weeds. You cannot have a garden, if you let weeds overrun it. So, if we want to make this world a garden for children, we must first of all learn the lesson of the gardener.

So far we have not been gardeners. We have only been a sort of silly reception committee. A reception committee at the Grand Central Station of life. Trainload after trainload of children are coming in, day and night—nameless refugees arriving out of the Nowhere into the Here. Trainload after trainload—many unwelcome, unwanted, unprepared for, unknown, without baggage, without passports, most of them without pedigrees. These unlimited hordes of refugees arrive in such numbers that the reception committee is thrown into a panic—a panic of activity. The reception committee arouses itself heroically, establishes emergency measures: milk stations, maternity centers, settlement houses, playgrounds, orphanages, welfare leagues and every conceivable kind of charitable effort. But still trainloads of children keep on coming—human weeds crop up that spread so fast in this sinister struggle for existence, that the overworked committee becomes exhausted, inefficient and can think of no way out.

When we protest against this immeasurable, meaningless waste of motherhood and child-life; when we protest against the ever-mounting cost to the world of asylums, prisons, homes for the feeble-minded and such institutions for the unfit, when we protest against the disorder and chaos and tragedy of modern life, when we point out the biological corruption that is destroying the very heart of American life, we are told that we are making merely an “emotional” appeal. When we point the one immediate practical way toward order and beauty in society, the only way to lay the foundations of a society composed of happy children, happy women and happy men, they call this idea indecent and immoral.

It is not enough to clean up the filth and disorder of our overcrowded cities. It is not enough to stop the evil of Child Labor—even if we could! It is not enough to decrease the rate of infantile mortality. It is not enough to open playgrounds, and build more public schools in which we can standardize the minds of the young. It is not enough, to throw millions upon millions of dollars into charities and philanthropies. Don’t deceive ourselves that by so doing we are making the world “Safe for Children.”

Those of you who have followed the sessions of this Conference must, I am sure, agree with me that the first real step toward the creation of a Children’s Era must lie in providing the conditions of healthy life for children not only before birth but even more imperatively before con-

ception. Human society must protect its children—yes, but prenatal care is most essential! The child-to-be, as yet not called into being, has rights no less imperative.

We have learned in the preceding sessions of this Conference that, if we wish to produce strong and sturdy children, the embryo must grow in a chemically healthy medium. The blood stream of the mother must be chemically normal. Worry, strain, shock, unhappiness, enforced maternity, may all poison the blood of the enslaved mother. This chemically poisoned blood may produce a defective baby—a child foredoomed to idiocy, or feeble-mindedness, crime, or failure.

Do I exaggerate? Am I taking a rare exception and making it a general rule? Our opponents declare that children are conceived in love, and that every new-born baby converts its parents to love and unselfishness. My answer is to point to the asylums, the hospitals, the ever-growing institutions for the unfit. Look into the family history of those who are feeble-minded; or behind the bars of jails and prisons. Trace the family histories; find out the conditions under which they were conceived and born, before you attempt to persuade us that reckless breeding has nothing to do with these grave questions.

There is only one way out. We have got to fight for the health and happiness of the Unborn Child. And to do that in a practical, tangible way, we have got to free women from enforced, enslaved maternity. There can be no hope for the future of civilization, no certainty of racial salvation, until every woman can decide for herself whether she will or will not become a mother and when and how many children she cares to bring into the world. That is the first step.

I would like to suggest Civil Service examinations for parenthood! Prospective parents after such an examination would be given a parenthood license, proving that they are physically and mentally fit to be the fathers and mothers of the next generation.

This is an interesting idea—but then arises the questions “Who is to decide?” “Would there be a jury, like a play jury?” Would a Republican administration give parenthood permits only to Republicans—or perhaps only to Democrats? The more you think of governmental interference, the less it works out. Take this plan of civil service examination for parenthood. It suggests Prohibition: there might even be bootlegging in babies!

No, I doubt the advisability of governmental sanction. The problem of bringing children into the world ought to be decided by those most seriously involved—those who run the greatest risks; in the last analysis—by the mother and the child. If there is going to be any Civil Service examination, let it be conducted by the Unborn Child, the Child-to-be.

Just try for a moment to picture the possibilities of such an examination.

When you want a cook or housemaid, you go to an employment bureau. You have to answer questions. You have to exchange references. You have to persuade the talented cook that you conduct a proper well-run household. Children ought to have at least the same privilege as cooks. Sometimes in idle moments I like to think it would be a very good scheme to have a bureau of the Child-to-be.

At such a bureau of the unborn, the wise child might be able to find out a few things about its father—and its mother. Just think for a moment of this bureau where prospective parents might apply for a baby. Think of the questions they would be asked by the agent of the unborn or by the baby itself.

First: “Mr. Father, a baby is an expensive luxury. Can you really afford one?”

“Have you paid for your last baby yet?”

“How many children have you already? Six? You must have your hands full. Can you take care of so many?”

“Do you look upon children as a reward—or a penalty?”

“How are your ductless glands—well balanced?”

“Can you provide a happy home for one! A sunny nursery? Proper food?”

“What’s that you say? Ten children already? Two dark rooms in the slums?”

“No, thank you! I don’t care to be born at all if I cannot be well-born. Good-bye!”

And if we could organize a society for the prevention of cruelty to unborn children, we would make it a law that children should be brought into the world only when they were welcome, invited and wanted; that they would arrive with a clean bill of health and heritage; that they would possess healthy, happy, well-mated and mature parents.

And there would be certain conditions of circumstances which would preclude parenthood. These conditions, the presence of which would make parenthood a crime, are the following:

1. Transmissible disease
2. Temporary disease
3. Subnormal children already in the family
4. Space out between births
5. Twenty-three years as a minimum age for parents
6. Economic circumstances adequate
7. Spiritual harmony between parents.

In conclusion, let me repeat:

We are not trying to establish a dictatorship over parents. We want to free women from enslavement and unwilling motherhood. We are fighting for the emancipation of the mothers of the world, of the children of the world, and the children to be. We want to create a real Century of the Child—usher in a Children’s Era. We can do this by handing the terrific gift of life in bodies fit and perfect as can

be fashioned. Help us to make this Conference which has aroused so much interest the turning point toward this era. Only so can you help in the creation of the future.

### Supreme Court of Tennessee *John Thomas Scopes v. The State*

(Nashville, December Term, 1926.) Opinion filed January 17, 1927. Appeal from the Criminal Court of Rhea County; Hon. J. T. Raulston, Judge.

JOHN R. NEAL, CLARENCE DARROW, ARTHUR G. HAYES, DUDLEY FIELD MALONE, WILLIAM T. THOMAS, and FRANK B. MCELWEE, for plaintiff in error.

THOMAS H. MALONE and HENRY E. COLTON *amici curiae* for appellant.

FRANK M. THOMPSON, Attorney-General, ED. T. SEAY, and K.T. MCCONNICO, for defendant in error.

CHIEF JUSTICE GREEN delivered majority opinion; JUDGE CHAMBLISS concurring opinion, and JUSTICE COOK concurred; JUDGE COLIN P. MCKINNEY, opinion dissenting, and Judge SWIGGART did not participate.

Scopes was convicted of a violation of chapter 27 of the Acts of 1925, for that he did teach in the public schools of Rhea county a certain theory that denied the story of the divine creation of man, as taught in the Bible, and did teach instead thereof that man had descended from a lower order of animals. After a verdict of guilty by the jury, the trial judge imposed a fine of \$ 100, and Scopes brought the case to this court by an appeal in the nature of a writ of error.

The bill of exceptions was not filed within the time fixed by the court below, and, upon motion of the state, at the last term, this bill of exceptions was stricken from the record. *Scopes v. State*, 152 Tenn. 424. A motion to quash the indictment was seasonably made in the trial court raising several questions as to the sufficiency thereof and as to the validity and construction of the Statute upon which the indictment rested. These questions appear on the record before us and have been presented and debated in this court with great elaboration.

Chapter 27 of the Acts of 1925, known as the Tennessee Anti-Evolution Act is set out in the margin. While the Act was not drafted with as much care as could have been drafted, nevertheless there seems to be no great difficulty in determining its meaning. It is entitled:

“An Act prohibiting the teaching of the evolution theory in all the Universities, normals and all other public schools in Tennessee, which are supported in whole or in part by the public school funds of the state, and to provide penalties for the violations thereof.”

*Evolution*, like *prohibition*, is a broad term. In recent bickering, however, evolution has been understood to mean the theory which holds that man has developed from some pre-existing lower type. This is the popular significance of evolution, just as the popular significance of prohibition is prohibition of the traffic in intoxicating liquors. It was in that sense that evolution was used in this Act. It is that sense that the word will be used in this opinion, unless the context otherwise indicates. It is only to the theory of the evolution of man from a lower type that the Act before us was intended to apply, and much of the discussion we have heard is beside this case. The words of a Statute, if in common use, are to be taken in their natural and ordinary sense. *O'Neill v. State*, 115 Tenn. 437; *State ex rel. v. Turnpike Co.*, 34 Tenn. (2 Sneed) 90.

Thus defining evolution, this Act's title clearly indicates the purpose of the Statute to be the prohibition of teaching in the Schools of the State that man has developed or descended from some lower type or order of animales.

When the draftsman came to express this purpose in the body of the Act, he first forbade the teaching of "any theory that denies the story of the divine creation of man, as taught in the Bible"—his conception evidently being that to forbid the denial of the Bible story would ban the teaching of evolution. To make the purpose more explicit, he added that it should be unlawful to teach "that man had descended from a lower order of animals."

Supplying the ellipsis in section 1 of the act, it reads that it shall be unlawful for any teacher, etc.—"to teach any theory that denies the story of the divine creation of man as taught in the Bible, and to teach instead [of the story on the divine creation of man as taught in the Bible] that man has descended from a lower order of animals."

The language just quoted illustrates what is called in rhetoric exposition by iteration. The different form of the iterated idea serves to expound the first expression of the thought. The undertaking of the Statute was to prevent teaching of the evolution theory. It was considered this purpose could be effected by forbidding the teaching of any theory that denied the Bible story, but to make the purpose clear it was also forbidden to teach that man descended from a lower order of animals.

This manner of expression in written instruments is common, and gives use to the maxim of construction *noscitur a sociis*. Under this maxim subordinate words and phrases are modified and limited to harmonize with each other and with the leading and controlling purpose or intention of the act. For example, see Lewis' Southerland Stat. Const. Sec. 415 et seq.; *Caldwell & Co. v. Lea*, 152 Tenn. 48. It thus seems plain that the Legislature in this enactment only intended to forbid teaching that men descended from a lower order of animals. The denunciation of any

theory denying the Bible story of creation is restricted by the caption and by the final clause of section 1.

So interpreted, the Statute does not seem to be uncertain in its meaning nor incapable of enforcement for such a reason, notwithstanding the argument to the contrary. The indictment herein follows the language of the Statute. The statute being sufficiently definite in its terms, such an indictment is good. *State v. Odam*, 70 Tenn. (2 Lea) 220; *Villines v. State*, 96 Tenn. 141, *Griffin v. State*, 109 Tenn. 17. The assignments of error, which challenge the sufficiency of the indictment and the uncertainty of the Act, are accordingly overruled.

It is contended that the Statute violates section 8 of article 1 of the Tennessee Constitution, and section 1 of the Fourteenth Amendment of the Constitution of the United States—the Law of the Land clause of the state Constitution, and the Due Process of Law clause of the Federal Constitution, which are practically equivalent in meaning.

We think there is little merit in this contention. The plaintiff in error was a teacher in the public schools of Rhea county. He was an employee of the State of Tennessee or of a municipal agency of the State. He was under contract with the State to work in an institution of the State. He had no right or privilege to serve the State except upon such terms as the State prescribed. His liberty, his privilege, his immunity to teach and proclaim the theory of evolution, elsewhere than in the service of the State, was in no wise touched by this law.

The Statute before us is not an exercise of the police power of the State undertaking to regulate the conduct and contracts of individuals in their dealings with each other. On the other hand, it is an Act of the State as a corporation, a proprietor, an employer. It is a declaration of a master as to the character of work the master's servant shall, or rather shall not, perform. In dealing with its own employees engaged upon its own work, the State is not hampered by the limitations of section 8 of article 1 of the Tennessee Constitution, nor of the Fourteenth Amendment to the Constitution of the United States.

In *People v. Crane*, 214 N.Y. 154, the validity of a Statute of that State, providing that citizens only should be employed upon public works was sustained. In the course of opinion (page 175), it was said: "The Statute is nothing more, in effect, than a resolve by an employer as to the character of his employees. An individual employer would communicate the resolve to his subordinate by written instructions or by word of mouth. The State, an incorporeal master, speaking through the Legislature, communicates the resolve to its agents by enacting a statute. Either the private employer or the State can revoke the resolve at will. Entire liberty of action in these respects is essential unless the State is to be deprived of a right which has heretofore been deemed a constituent element of the relationship of

master and servant, namely, the right of the master to say who his servants shall (and therefore shall not) be." A case involving the same Statute reached the Supreme Court of the United States, and the integrity of the Statute was sustained by that tribunal. *Heim v. McCall*, 239 U.S. 175, 60 L.Ed. 207. The Supreme Court referred to *People v. Crane*, supra, and approvingly quoted a portion of the language of BARRETT, Chief Judge, that we have set out above.

At the same term of the Supreme Court of the United States an Arizona Statute, prohibiting individuals and corporations with more than five workers from employing less than 80 per cent. thereof of qualified electors or native-born citizens of the United States was held invalid. *Truax v. Raich*, 239 U.S. 33, 60 L.Ed. 131.

These two cases from the Supreme Court make plain the differing tests to be applied to a Statute regulating the State's own affairs and a statute regulating the affairs of private individuals and corporations.

A leading case is *Atkins v. Kansas*, 191 U.S. 207, 48 L.Ed. 148. The court there considered and upheld a Kansas Statute making it a criminal offense for a contractor for a public work to permit or require an employee to perform labor upon that work in excess of eight hours each day. In that case it was laid down:

"...For, whatever may have been the motives controlling the enactment of the statute in question, we can imagine no possible ground to dispute the power of the State to declare that no one undertaking work for it or for one of its municipal agencies, should permit or require an employee on such work to labor in excess of eight hours each day, and to inflict punishment upon those who are embraced by such regulations and yet disregard them.

"It cannot be deemed a part of the liberty of any contractor that he be allowed to do public work in any mode he may choose to adopt., without regard to the wishes of the State. On the contrary, it belongs to the State, as the guardian and trustee for its people, and having control of its affairs, to prescribe the conditions upon which it will permit public work to be done on its behalf, or on behalf of its municipalities. No court has authority to review its action in that respect. Regulations on this subject suggest only considerations of public policy. And with such considerations the courts have no this concern." In *Ellis v. United States*, 206 U.S. 246, 51 L.Ed. 1047, *Atkins v. Kansas* was followed, and an Act of Congress sustained which prohibited, under penalty of fine or imprisonment, except in case of extraordinary emergency, the requiring or permitting laborers or mechanics employed upon any of the public works of the United States or of the District of Columbia to work more than eight hours each day. These cases make it obvious that the State or Government, as an incident to its power to authorize and enforce contracts for public services, "may require that they shall be carried out only in

a way consistent with its views of public policy, and may punish a departure from that way." *Ellis v. United States*, supra. To the same effect is *Waugh v. Board of Trustees*, 237 U.S. 589, 59 L.Ed. 1131, in which a Mississippi Statute was sanctioned that prohibited the existence of Greek letter fraternities and similar societies in the State's educational institutions, and deprived members of such societies of the right to receive or compete for diploma, class honors, etc.

This court has indicated a like view in *Leeper v. State*, 103 Tenn. 500, in which the constitutionality of chapter 205 of the Acts of 1899, known as the "Uniform Text Book Law," was sustained. In the opinion in that case Judge WILKES observed:

"If the authority to regulate and control schools is legislative, then it [is] must have an unrestricted right to prescribe methods, and the courts cannot interfere with it unless some scheme is devised which is contrary to other provisions of the Constitution..."

In *Marshall & Bruce Co. v. City of Nashville*, 109 Tenn. 495, the charter of the City of Nashville required that all contracts for goods and supplies furnished the city, amounting to over \$50, must be let out at competitive bidding to the lowest responsible bidder. In the face of such a charter provision, an ordinance of the city, which provided that all city printing should bear the union label, was held unauthorized—necessarily so. The lowest bidder, provided he was responsible, was entitled to such a contract, whether he employed union labor, and was empowered to affix the union label to his work or not. Other things said in that case were not necessary to the decision.

*Traux v. Raich*, supra, *Meyer v. Nebraska*, 262 U.S. 390, *Pierce v. Society of the Holy Names of Jesus and Mary*, 268 U.S. 510, and other decisions of the Supreme Court of the United States, pressed upon us by counsel for plaintiff in error, deal with Statutes affecting individuals, corporations, and private institutions, and we do not regard these cases as in point.

Since the State may prescribe the character and the hours of labor of the employees on its works, just as freely may it say what kind of work shall be performed in its service, what shall be taught in its schools, so far at least as section 8 of article 1 of the Tennessee Constitution, and the Fourteenth Amendment to the Constitution of the United States, are concerned.

But it is urged that chapter 27 of the Acts of 1925 conflicts with section 12 of article 11, the Educational clause, and section 3 of article 1, the Religious Preference clause, of the Tennessee Constitution. It is to be doubted if the plaintiff in error, before us only as the state's employee, is sufficiently protected by these constitutional provisions to justify him in raising such questions. Nevertheless, as the State appears to concede that these objections are properly here made, the court will consider them.

The relevant portion of section 12 of article 11 of the Constitution is in these words:

“...It shall be the duty of the General Assembly in all future periods of this government, to cherish Literature and Science.”

The argument is that the theory of the descent of man from a lower order of animals is now established by the preponderance of scientific thought and that the prohibition of the teaching of such theory is a violation of the legislative duty to cherish Science.

While this clause of the Constitution has been mentioned in several of our cases, these references have been casual, and no Act of the Legislature has ever been held inoperative by reason of such provision. In one of the opinions in *Green v. Allen*, 24 Tenn. (5 Humph.) 170, the provision was said to be directory. Although this court is loath to say that any language of the Constitution is merely directory *State v. Burrow*, 119 Tenn. 376, *Webb v. Carter*, 129 Tenn. 182, we are driven to the conclusion that this particular admonition must be so treated. It is too vague to be enforced by any court. To cherish Science means to nourish, to encourage, to foster Science.

In no case can the court directly compel the Legislature to perform its duty. In a plain case the court can prevent the Legislature from transgressing its duty under the Constitution by declaring ineffective such a legislative Act. The case, however, must be plain, and the legislative Act is always given the benefit of any doubt.

If a bequest were made to a private trustee with the avails of which he should cherish Science, and there was nothing more, such a bequest would be void for uncertainty. *Green v. Allen*, 24 Tenn. (5 Humph.) 170, *Ewell v. Sneed*, 136 Tenn. 602, and the cases cited. It could not be enforced as a charitable use in the absence of prerogative power in this respect which the courts of Tennessee do not possess. A bequest in such terms would be so indefinite that our courts could not direct a proper application of the trust fund nor prevent its misapplication. The object of such a trust could not be ascertained.

If the courts of Tennessee are without power to direct the administration of such a trust by an individual, how can they supervise the administration of such a trust by the Legislature? It is a matter of far more delicacy to undertake the restriction of a coordinate branch of government to the terms of a trust imposed by the Constitution than to confine an individual trustee to the terms of the instrument under which he functions. If language be so indefinite as to preclude judicial restraint of an individual, such language could not possibly excuse judicial restraint of the General Assembly.

If the Legislature thinks that, by reason of popular prejudice, the cause of education and the study of Science generally will be promoted by forbidding the teaching of

evolution in the schools of the State, we can conceive of no ground to justify the court's interference. The courts cannot sit in judgment on such Acts of the legislature or its agents and determine whether or not the omission or addition of a particular course of study tends “to cherish Science.”

The last serious criticism made of the Act is that it contravenes the provision of section 3 of article 1 of the Constitution, “that no preference shall ever be given, by law, to any religious establishment or mode of worship.”

The language quoted is a part of our Bill of Rights, was contained in our first Constitution of the state adopted in 1796, and has been brought down into the present Constitution.

At the time of the adoption of our first Constitution, this government had recently been established and the recollection of previous conditions was fresh. England and Scotland maintained State churches as did some of the Colonies, and it was intended by this clause of the Constitution to prevent any such undertaking in Tennessee.

We are not able to see how the prohibition of teaching the theory that man has descended from a lower order of animals gives preference to any religious establishment or mode of worship. So far as we know, there is no religious establishment or organized body that has in its creed or confession of faith any article denying or affirming such a theory. So far as we know, the denial or affirmation of such a theory does not enter into any recognized mode of worship. Since this cause has been pending in this court, we have been favored, in addition to briefs of counsel and various *amici curiae*, with a multitude of resolutions, addresses, and communications from scientific bodies, religious factions, and individuals giving us the benefit of their views upon the theory of evolution. Examination of these contributions indicates that Protestants, Catholics, and Jews are divided among themselves in their beliefs, and that there is no unanimity among the members of any religious establishment as to this subject. Belief or unbelief in the theory of evolution is no more a characteristic of any religious establishment or mode of worship than is belief or unbelief in the wisdom of the prohibition laws. It would appear that members of the same churches quite generally disagree as to these things.

Furthermore, chapter 277 of the Acts of 1925 *requires* the teaching of nothing. It only *forbids* the teaching of evolution of man from a lower order of animals. Chapter 102 of the Acts of 1915 requires that ten verses from the Bible be read each day at the opening of every public school, without comment, and provided the teacher does not read the same verses more than twice during any session. It is also provided in this Act that pupils may be excused from the Bible readings upon the written request of their parents. As the law thus stands, while the theory of evolution of man may not be taught in the schools of the State, nothing

contrary to that theory is required to be taught. It could scarcely be said that the statutory scriptural reading just mentioned would amount to teaching of a contrary theory.

Our school authorities are therefore quite free to determine how they shall act in this state of the law. Those in charge of the educational affairs of the State are men and women of discernment and culture. If they believe that the teaching of the Science of Biology had been so hampered by chapter 27 of the Acts of 1925 as to render such an effort no longer desirable, this course of study may be entirely omitted from the curriculum of our schools. If this be regarded as a misfortune, it must be charged to the Legislature. It should be repeated that the act of 1925 deals with nothing but the evolution of man from a lower order of animals.

It is not necessary now to determine the exact scope of the Religious Preference clause of the Constitution and other language of that section. The situation does not call for such an attempt. Section 3 of article 1 is binding alike on the Legislature and the school authorities. So far we are clear that the Legislature has not crossed these constitutional limitations. If hereafter the school authorities should go beyond such limits, a case can then be brought to the courts.

Much has been said in argument about the motives of the Legislature in passing this Act. But the validity of a statute must be determined by its natural and legal effect, rather than proclaimed motives. *Lochner v. New York*, 198 U.S. 45; *Grainger v. Douglas Park Jockey Club* 148 F. 513; 6 R.C.L. 111, 81. Some other questions are made, but in our opinion they do not merit discussion, and the assignments of error raising such questions are overruled.

This record disclosed that the jury found the defendant below guilty, but did not assess the fine. The trial judge himself undertook to impose the minimum fine of \$100 authorized by the Statute. This was error. Under section 14 of article 6 of the Constitution of Tennessee, a fine in excess of \$ 50 must be assessed by a jury. The Statute before us does not permit the imposition of a smaller fine than \$ 100. Since a jury alone can impose the penalty this Act requires, and as a matter of course no different penalty can be inflicted, the trial judge exceeded his jurisdiction in levying this fine, and we are without power to correct his error. The judgment must accordingly be reversed. *Upchurch v. State*, 153 Tenn. 198. The Court is informed that the plaintiff in error is no longer in the service of the State. We see nothing to be gained by prolonging the life of this bizarre case. On the contrary, we think the peace and dignity of the State, which all criminal prosecutions are brought to redress, will be better conserved by the entry of a *nolle prosequi* herein. Such a course is suggested to the Attorney-General.

Mr. Justice SWIGGART took no part in the decision. He came to the bench upon the death of Mr. Justice HALL, after the argument and submission hereof.

#### CHAMBLISS, J. (concurring)

While I concur in the conclusions announced by Chief Justice GREEN, and agree, as so ably shown by him, that it is within the power of the Legislature to so prescribe the public school curriculum as to prohibit the teaching of the evolution of man from a lower order of animals life, even though the teaching of some branches of science may be thereby restricted, I am of the opinion that the constitutional objections urged do not apply for yet other reasons, and in another view.

Two theories of organic evolution are well recognized, one the *theistic*, which not only concedes, but maintains, consistently with the Bible story, that "the Lord God formed man from the dust of the earth, and breathed into his nostrils the breath of life, and man became a living soul." This is the theory advanced eloquently by learned counsel for Scopes, and held to by numerous outstanding scientists of the world. The other theory is known as the *materialistic*, which denies that God created man, that He was the First Cause, and seeks in shadowy uncertainties for the origins of life. The act before us, as I view it, prohibits the teaching in public schools of the State of this latter theory, inconsistent not only with the common belief of mankind of every clime and creed and "religious establishment," even those that reject Christ or Judaism, and look through Buddha or Mohammed to God, but inconsistent also with our Constitution and the fundamental declaration lying back of it, through all of which runs recognition of and appeal to "God," and a life to come. The Declaration of Independence opens with a reference to "the laws of nature and nature's God," and holds this truth "to be self-evident, that all men are created equal, that they are endowed by their Creator," etc., and concludes "with a firm reliance on the protection of Divine Providence." The Articles of Confederation and Perpetual Union read—"And whereas, it hath pleased the Great Governor of the world." And so section 3 of article 1 of the Constitution of this State, which declares that "no preference shall ever be given, by law, to any religious establishment," opens with the declaration "that all men have a natural and indefeasible right to worship Almighty God," while section 2 of article 9 declares that "no person who denies the being of God, or a future state of rewards and punishments, shall hold any office in the Civil department of this state." That the Legislature may prohibit the teaching of the future citizens and office holders of the State of a theory which denies the Divine Creator will hardly be denied.

Now I find it conceded in an exceptionally able brief for Scopes, devoted exclusively to the question of uncertainty,

that “the act might be construed as only aimed at materialists.” This is my view of it. As I read it, the act makes no war on evolution, except in so far as the evolution theory conflicts with the recognition of the Divine in creation.

While it is conceded that the language is in some respects ambiguous, analysis of the caption and body of the act as a whole appears to sustain this view. The variance between the caption and the body of the act is significant. The caption refers broadly to “the Evolution Theory” but it is clear that the act itself, as finally framed and passed, was expressly limited and restricted in its body to the prohibition of the teaching—not of *any* theory of evolution at all, but of any theory only that denies or controverts “the Divine Creation of man.” While the language used is “any theory that denies *the story of* the Divine Creation of man *as taught in the Bible*,” the italicized phraseology may be said to be descriptive only of the essential matter. It may be insisted that these words, when given their proper force, serve to narrow the meaning of the act so as to confine its operation to prohibition against the denial of the Divine Creation of man to the story taught in the Bible as interpreted by those literalists who hold to the instantaneous creation view. In reply, it may be said that however plausible may be this construction or application of this language, it must be rejected on the very grounds emphasized by learned counsel, who adopt it and then proceed to predicate there on their argument for the unconstitutionality of the act. The courts may go far to avoid a construction which will destroy the act. This is axiomatic. One may not consistently contend for a construction of language, at all open to construction, which, if applied, will make void the act. Moreover, it would seem that, since “the story as taught in the Bible” of man’s creation by God from the dust of the earth is readily susceptible of the construction given it by those known as liberalists, this language is consistent with the conclusion that what the act aims at and effects is the prohibition of the teaching of any such theory only as denies that man was *divinely created* according to the Bible story, *however this story may be interpreted as to details*. So long as the story as told in the Bible is so construed as to recognize the Divine creation of man, these words have no limiting effect upon the central and essential object of the act as hereinbefore suggested—to restrain the inculcation into the minds of pupils of the public schools of any theory that denies the Divine Creation of man, and on the contrary traces his origin, *in exclusion of the divine*, to a lower order of animal life. It is this materialistic teaching which is denounced, and, so construed, the act may clearly be sustained, negative only as it is, first, of the right to teach in the public schools as denial of the existence, recognized by our Constitution, of the Creator of all mankind; and second, of the right to teach any theory which involves the support or advocacy of either, or any, religious dogma or view.

The concluding phrase, “and to teach instead that man has descended from a lower order of animals,” is added on the apparent assumption that such teaching involves a denial, which the preceding clause prohibits, of Divine creation. The use of this language, aptly defined by our learned Chief Justice as a species of iteration, for the purpose of emphasis, indicates an intention to set over one against the other, the theory, or “story” of man’s Divine creation, and the antagonistic and materialistic theory, or “story,” of his origin in the animal kingdom, to the exclusion of God. The phraseology is antithetical—a favorite form of strengthening statement. “Measures, not men.” Springing from God, not animals. The two theories of man’s origin are placed in direct opposition; the manifest purpose being to emphasize the essence of the thing prohibited, the teaching of a denial of man’s divine creation.

The following statement of Dr. E. N. Reinke, Professor of Biology in Vanderbilt University, is repeatedly quoted in briefs of counsel for the defense:

“The theory of evolution is altogether essential to the teaching of biology and its kindred sciences. To deny the teacher of biology the use of this most fundamental generalization of his science would make his teaching as chaotic as an attempt to teach astronomy without the law of gravitation or physics without assuming the existence of the ether.”

Conceding that “the theory of evolution is altogether essential to the teaching of biology and its kindred sciences,” it will not be contended by Dr. Reinke, or by learned counsel quoting from him, that the theory of evolution essentially involves the denial of the Divine creation of man, and that, when construed to prohibit such a denial only, the act is objectionable as denying to “the teacher of biology the use of the most fundamental generalization of his science.”

Now, in this view, it is clear that the constitutional direction to cherish education and science is not disregarded. The teaching of all sciences may have full legitimate sway, with the restriction only that the teaching shall not convey a denial of man’s Divine origin—God as his Creator. The theories of Drummond, Winchell, Fiske, Hibbens, Millikan, Kenn, Merriam, Angell, Cannon Barnes, and a multitude of others, whose names are invoked in argument and brief, do not deny the story of the Divine creation of man as taught in the Bible, evolutionists though they be, but construing the Scripture for themselves in the light of their learning, accept it as true and their teaching would not come under the ban of this act.

Much that has been said here bears directly upon the contention that section 3, art. 1, of our Constitution is violated, in that a preference is given by law to those “religious establishments which have as one of their tenets or dogmas the instantaneous creation of man.” As was said by

Chief Justice GREEN, the act gives no preference to any particular religious establishment. The doctrine or tenet of the instantaneous creation of man is not set forth or preferred over other conceptions. It is too well established for argument that "the story of the divine creation of man as taught in the Bible" is accepted—not "denied"—by millions of men and women who do not interpret it as teaching instantaneous creation, who hold with the Psalmist that "a thousand years in thy sight are but as yesterday when it is past," as but a day. It follows that to forbid the teaching of a denial of the biblical account of Divine creation does not, expressly or by fair implication, involve acceptance or approval of instantaneous creation, held to by some literalists. One is not prohibited by this act from teaching, either that "days," as used in the book of Genesis, means days of 24 hours, the literalist view, or days of "a thousand years" or more, as held by liberalists, so long as the teaching does not exclude God as the author of human life.

Considering the caption and body of this act as a whole, it is seen to be clearly negative only, not affirmative. It requires nothing to be taught. It prohibits merely. And it prohibits, not the teaching of *any* theory of evolution, but that theory (of evolution) only that denies, takes issues with, positively disaffirms, the creation of man by God (as the Bible teaches), and that, instead of being so created, he is a product of, springs from, a lower order of animals. No authority is recognized or conferred by the laws of this State for teaching in the public schools, on the one hand, of the Bible, or any of its doctrines or dogmas, and this act prohibits the teaching on the other hand of any denial thereof. It is purely an act of neutrality. Ceaseless and irreconcilable controversy exists among our citizens and taxpayers, having equal rights, touching matters of religious faith, and it is within the power of the Legislature to declare that the subject shall be excluded from the tax-supported institutions—that the State shall stand neutral—rendering "unto Caesar the things which be Caesar's and unto God the things which be God's," and insuring the completeness of separation of Church and State.

In the light of this interpretation, is the act void for uncertainty? I think not. If the act were affirmative in its requirements, calling for the teaching of *some* theory, the objection would be more plausible. A clear chart is more necessary when one must move, over matter or in mind, than when one is required merely *not* to act or teach. Any reasonable intelligence should be able to understand and observe the plain prohibition against instilling into the minds of the pupil a denial that he is a creation of God, but rather a product of the beast of the field; against teach-

ing—and the term is here employed in the sense of seeking to convince—the pupil affirmatively that his origin is not Divine, but material, through the animal. He who runs may read. He need do no guessing as to what particular conception or view of the Bible account he shall teach. The act does not require that he choose between the fundamentalist and the modernist, the literalist and the liberalist. Our laws approve no teaching of the Bible at all in the public schools, but require only that no theory shall be taught which denies that God is the Creator of man—that his origins not thus to be traced.

In brief, as already indicated, I concur with the majority in the conclusion (1) that this case must be reversed for the error of the judge in fixing the fine, (2) that a *nolle prosequi* should be entered, and (3) that the act is constitutional as within the powers of the Legislature as the employer of its teachers. However, I go further and find the act constitutional for additional reasons rested upon the view that the act fairly construed is limited to the prohibition of the teaching of any theory of evolution only which denies the Divine creation of man, without regard to details of religious belief, of differing interpretations of the story as taught in the Bible. In this view the constitutionality of the act is sustained, but the way is left open for such teaching of the pertinent sciences as is approved by the progressive God recognizing leaders of thought and life.

#### MCKINNEY, J. (dissenting)

An elemental rule of statutory construction, which is well stated by Mr. Justice SUTHERLAND in delivering the opinion of the Supreme Court of the United States in *Connally v. General Construction Company*, 46 Sup. Ct. Rep., 126, is as follows:

"That the terms of a penal statute creating a new offense must be sufficiently explicit to inform those who are subject to it what conduct on their part will render them liable to its penalties is a well-recognized requirement, consonant alike with ordinary notions of fair play and the settled rules of law; and a statute which either forbids or requires the doing of an act in terms so vague that men of common intelligence must necessarily guess at its meaning and differ as to its application violates the first essential of due process of law. *International Harvester Co. v. Kentucky*, 234 U.S. 216, 34 S.Ct. 853, 58 L.Ed., 1284; *Collins v. Kentucky*, 234 U.S. 638, 34 S.Ct. 924, 58 L.Ed. 1510."

Applying the foregoing rule to the statute here involved, I am of the opinion that it is invalid for uncertainty of meaning. I therefore, respectfully dissent from the contrary holding of my associates.

# About the Editors

**General Editor: Gary B. Nash** received a Ph.D. from Princeton University. He is director of the National Center for History in the Schools at the University of California, Los Angeles, where he teaches American history of the colonial and Revolutionary era. He is a published author of college and precollegiate history texts. Among his best-selling works are the coauthored *American People: Creating a Nation and Society* (Longman, 1998), now in its seventh edition; *American Odyssey: The U.S. in the Twentieth Century* (McGraw-Hill/Glencoe, 1999), now in its fourth edition; and *The Atlas of American History*, coauthored with Carter Smith (Facts On File, 2006).

Nash is an elected member of the Society of American Historians, the American Academy of Arts and Sciences, the American Antiquarian Society, and the American Philosoph-

ical Society. He has served as past president of the Organization of American Historians in 1994–95 and was a founding member of the National Council for History Education. His latest books include *First City: Philadelphia and the Forging of Historical Memory* (University of Pennsylvania Press, 2002), *The Unknown American Revolution: The Unruly Birth of Democracy and the Struggle to Create America* (Viking, 2005), and *The Forgotten Fifth: African Americans in the Era of Revolution* (Harvard University Press, 2006).

**Volume Editor: John W. Jeffries**, dean of arts, humanities, and social sciences at the University of Maryland, Baltimore County, received a Ph.D. from Yale University. He is the author of several books, including *Wartime America: The World War II Home Front* (Ivan Dee, 1996).

# Foreword

The Encyclopedia of American History series is designed as a handy reference to the most important individuals, events, and topics in U.S. history. In 10 volumes, the encyclopedia covers the period from the 15th century, when European explorers first made their way across the Atlantic Ocean to the Americas, to the present day. The encyclopedia is written for precollegiate as well as college students, for parents of young learners in the schools, and for the general public. The volume editors are distinguished historians of American history. In writing individual entries, each editor has drawn upon the expertise of scores of specialists. This ensures the scholarly quality of the entire series. Articles contributed by the various volume editors are uncredited.

This 11-volume encyclopedia of “American history” is broadly conceived to include the historical experience of the various peoples of North America. Thus, in the first volume, many essays treat the history of a great range of indigenous people before contact with Europeans. In the same vein, readers will find essays in the first several volumes that sketch Spanish, Dutch, and French explorers and colonizers who opened up territories for European settlement that later would become part of the United States. The venues and cast of characters in the American historical drama are thus widened beyond traditional encyclopedias.

In creating the eras of American history that define the chronological limits of each volume, and in addressing major topics in each era, the encyclopedia follows the architecture of *The National Standards for United States History, Revised Edition* (Los Angeles: National Center for History in the Schools, 1996). Mandated by the U.S. Congress, the national standards for U.S. history have been widely used by states and school districts in organizing curricular frameworks and have been followed by many other curriculum-building efforts.

Entries are cross-referenced, when appropriate, with *See also* citations at the end of articles. At the end of most entries, a listing of articles and books allows readers to turn to specialized sources and historical accounts. In each volume, an array of maps provide geographical context, while numerous illustrations help vivify the material covered in the text. A time line is included to provide students with a chronological reference to major events occurring in the given era. The selection of historical documents in the back of each volume gives students experience with the raw documents that historians use when researching history. A comprehensive index to each volume also facilitates the reader’s access to particular information.

In each volume, long entries are provided for major categories of American historical experience. These categories may include: African Americans, agriculture, art and architecture, business, economy, education, family life, foreign policy, immigration, labor, Native Americans, politics, population, religion, urbanization, and women. By following these essays from volume to volume, the reader can access what might be called a mini-history of each broad topic, for example, family life, immigration, or religion.

—Gary B. Nash  
University of California, Los Angeles

# Foreword to the Revised Edition

“History has to be rewritten in every generation because, although the past does not change, the present does,” writes Lord Christopher Hill, one of Great Britain’s most eminent historians. “Each generation asks new questions of the past, and finds new areas of sympathy as it re-lives different aspects of the experiences of its predecessors.” It is this understanding, that the pursuit of historical knowledge requires new research and new reflections on the past, that undergirds a revised and extended edition of the *Encyclopedia of American History*.

The individual volume editors of this revised edition have made important additions and revisions to the original edition published in 2003. Most important, they have added many new entries—several hundred for the entire 11-volume set. This puts more meat on the bone of what was already a comprehensive encyclopedia that presented four centuries of American history in all its diversity and complexity. For the 10th volume, covering the period from 1969 to the present, new entries cover momentous events and important figures of the last six years. For the other volumes, new entries increase the diversity of Americans covered by biographical accounts as well as events that new scholarship shows have had greater importance than recognized heretofore.

In addition, careful attention has been given to correcting occasional errors in the massive number of entries in the first edition. Also, many entries have been revised to add further details while making adjustments, based on new scholarship, to the interpretation of key events and movements. Consonant with that effort to make the encyclopedia as fresh and usable as possible, the volume editors have added many new recently published books to the “Further Reading” notes at the ends of the entries, and new full-color historical maps help put history in its geographical context.

—Gary B. Nash

# Introduction

The years from 1929 to 1945 were by any reckoning among the most eventful and important in American history. In barely more than a decade and a half, the United States experienced the Great Depression and World War II—the worst period of hard times in the nation’s history and then the worst war in world history. Having a large and ramifying impact on the United States, the events of the depression and war deeply influenced national life and directions in the decades to follow. For most of the period, moreover, Franklin D. Roosevelt, the most important American president of the 20th century, was in the White House. The Roosevelt administration implemented the New Deal and, with it, the modern American regulatory-welfare state; it made the Democratic Party the nation’s majority party for a generation and more; it managed the wartime mobilization that not only helped win the war but also ended the depression; and it led the United States into a new era of global activism and leadership.

The Great Depression and World War II thus brought pivotal economic, political, diplomatic, and military developments, and the entries in this volume of the *Encyclopedia of American History* reflect that fact. But the period was also one of important social and cultural developments. Demographic patterns; popular culture; the arts and literature; the status and roles of African Americans, women, and immigrant groups—these and other areas of American life also underwent change crucial to the shape of postwar America and receive significant attention in the entries that follow. And in addition to illuminating the importance and impact of the 1929 to 1945 era, the entries in this volume help to explain the period’s important continuities and connections to the pre-1929 past as well as to the post-1945 future.

I am grateful to the many people who helped make this volume possible. Gary Nash of UCLA and Owen Lancer of Facts On File gave me the opportunity to work on the project. Katherine Liapis Segrue, my assistant editor, wrote a number of entries, helped edit the others, and performed a variety of crucial administrative duties. In preparing the first edition, a number of people then in administrative positions at the University of Maryland, Baltimore County, made important contributions—Provost Art Johnson, by making essential space available; Policy Sciences Director Marv Mandell and Dean of Arts and Sciences Rick Welch, by enabling Kathy Segrue to work with me; and my department chair, Jim Grubb, by offering numerous kindnesses. Perhaps my greatest debt is to the contributors to this volume, many of them my present and former

students. Working with UMBC undergraduate and graduate students on this project has been a special and rewarding pleasure.

In this enterprise, my family—happily now a larger one—again sustained me and enriched my life. My gratitude for everything they have given to me goes to my wife, Renate; to our children, Martha and Bill, and their spouses, Scott and Amy; and to our grandchildren, Sarah, Julia, Savannah, Christopher, Rebecca, and Jack.

## A TO Z

## advertising

Advertising from 1929 to 1945 experienced the challenges of other BUSINESS enterprises in coping with the GREAT DEPRESSION and in adjusting to the priorities and changed circumstances of the WORLD WAR II HOME FRONT.

Advertising revealed important aspects of American culture as well. Both appealing to and influencing the hopes and fears of the American people, advertising patterns also reflected the emergence of RADIO as a central component of both the NEWS MEDIA and the POPULAR CULTURE. Newspapers remained by far the largest venue for advertising, accounting for close to half of advertising expenditures in the 1930s and for about one-third during the war. Direct mail was second for most of the period. By 1939, however, radio had passed magazines for third place, and then by 1944 overtook direct mailing. (After the war, direct mailing reclaimed second place in advertising dollars and television advertising became a major factor in the 1950s.)

As the ECONOMY plummeted in the early 1930s (and advertising expenditures dropped from \$3.4 billion in 1929 to just \$1.3 billion in 1933), advertisers tried various tactics to stimulate buying. Some pursued a tactic of boosterism, hoping to increase purchases by raising morale and confidence in the economy; others took a different tack, trying to capitalize on fears of declining economic and social status by pointing out such perils as an unappealing complexion or unstylish clothing; still others simply tried to enhance the allure of their products. Advertisers also turned increasingly to sophisticated market research and to scientific PUBLIC OPINION POLLS to determine public preferences and how to appeal to them.

The depression brought increased criticism of advertising, consistent with the declining image of business more generally. Some critics suggested that there needed to be truth in advertising regulations similar to the stock market reforms that required full and accurate disclosure. Consumers Research, Inc., was formed to test products and adver-

tising claims, and a splinter group from that organization established the Consumers Union. The FOOD, DRUG, AND COSMETIC ACT of 1938 gave the Food and Drug Administration additional power over labeling and advertising.

Advertising picked up by the middle of the decade and spending on ads rose to \$2.1 billion by 1940, with some of the increase going to marketing the electrical appliances—refrigerators, for example, and washing machines—that continued to transform American homes. (The importance and appeal of such TECHNOLOGY-based consumer goods were reflected in displays at the 1939–40 NEW YORK WORLD’S FAIR.) The federal GOVERNMENT also did its own form of advertising in the 1930s, from the “Blue Eagle” campaign of the NATIONAL RECOVERY ADMINISTRATION to publicity for the SOCIAL SECURITY ACT, to the posters for such agencies as the WORKS PROGRESS ADMINISTRATION and the FARM SECURITY ADMINISTRATION. Political parties and candidates for office continued election-time advertising as well.

Expenditures on advertising increased further as the economy recovered because of defense MOBILIZATION, but the American entry into WORLD WAR II raised issues for advertisers. Despite the return of prosperity, they worried that there might be little need for advertising when consumer goods were restricted because of war production. Concerned also that the government might take steps to limit advertising for fear that it would contribute to inflation by increasing product costs and consumer demand, advertisers formed the Advertising Council soon after PEARL HARBOR to protect the industry.

The Advertising Council worked with the OFFICE OF WAR INFORMATION and other government agencies to support the war effort. Facilitated by the Ad Council, advertising firms donated time and expertise to a sort of domestic PROPAGANDA that promoted WAR BONDS, victory gardens, scrap and fat drives, conservation of food and vital materials, and recruitment of men and women for the armed forces and defense industries. Such contributions

## 2 African Americans

to the war effort, which the Ad Council said amounted to some \$1 billion in services, paid off in continued visibility, increased prestige, and even tax write-offs.

Product advertising continued as well, and painted an appealing picture of the nation as well as of the goods the ads promoted. Expenditures on advertising rose to \$2.9 billion by 1945, and surely would have risen more without the constraints of the war years. Wartime ads depicted American GIs as innocent and decent idealists who would do their duty and win the war, and the home front as a place of hard work, common cause, sacrifice, and old-fashioned values that sustained the GIs and helped speed victory. As the end of the war neared, advertisements portrayed an America rooted in values and patterns of the past but propelled by the free enterprise system into a postwar future of economic abundance and wonderful new consumer goods. As it so often does, advertising both reflected and influenced the culture, for polls showed that most Americans wanted an era in which traditional American ways would continue but the American standard of living would be much better. It was a compelling picture, one that wartime and postwar Americans eagerly pursued.

### African Americans

For African Americans, the era of the GREAT DEPRESSION and WORLD WAR II was one of continuing and sometimes increased difficulties, but also one of achievement and change that laid important groundwork for the postwar CIVIL RIGHTS movement.

During and after World War I, southern blacks in significant numbers left the Jim Crow discrimination, segregation, disfranchisement, and brutality of the SOUTH for the “Promised Land” of the North and the factory jobs that offered a higher standard of living and greater autonomy from whites. This “Great Migration” forever changed the nature of black America. By the mid-20th century African Americans were becoming predominantly urban and non-southern, and a solid, though still small, black middle class had begun to emerge.

Urbanization was crucial to bringing down the wall restraining African Americans from full and equal access to the opportunities and benefits of American life. In 1928, Oscar DePriest, a Chicago Republican, became the first African American elected to CONGRESS from the North and the first black member of Congress since 1901. Growing political clout was further demonstrated when in 1930

Most Americans suffered greatly during the depression of the 1930s, but blacks, especially those in rural areas, were the hardest hit. Shown here is an evicted sharecropper with her baby. (*Library of Congress*)

the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP) helped turn back President HERBERT HOOVER’s nomination to the SUPREME COURT of John J. Parker, who had made racially prejudiced statements. Parker’s defeat prompted African Americans to focus on other unfriendly politicians, often effectively. The NAACP also had some significant successes with lawsuits and Supreme Court decisions in the 1930s and 1940s that began to erode legalized Jim Crow. The NAACP and other black leaders failed, however, to get federal ANTILYNCHING LEGISLATION through Congress.

By 1932, black voters were well along in the shift that had begun in 1928 from the REPUBLICAN PARTY to the DEMOCRATIC PARTY, and by 1936 they had become an integral part of the “Roosevelt Coalition” that made the Democrats the new majority party of the country. Symbolic of this change in party allegiance, a black Democrat, Arthur W. Mitchell, won DePriest’s congressional seat in

1934. This shift reflected dissatisfaction with the inattention, if not open hostility, of the party of Lincoln to the racial situation in America. Where Hoover had seemingly tried to build a “lily-white” Republican Party in the South, President FRANKLIN D. ROOSEVELT appointed more African Americans to significant GOVERNMENT positions than any prior president. An unofficial “BLACK CABINET” emerged in the Roosevelt administration to give advice on issues critical to African Americans and to recruit other blacks to government.

Indicative, however, of the ambivalent attitude and actions of the NEW DEAL on racial issues, the Black Cabinet was sometimes rebuffed by FDR and forced to see his subordinates. At other times, they sought access through the president’s wife, ELEANOR ROOSEVELT. She made her most famous gesture of support for African Americans in 1939, when she resigned from the Daughters of the American Revolution after the DAR refused to allow the singer Marian Anderson to give a concert recital in its Constitution Hall in Washington. Secretary of the Interior HAROLD ICKES offered an alternative site, and Anderson sang instead on Easter Sunday on the steps of the Lincoln Memorial. Mrs. Roosevelt was especially close to MARY McLEOD BETHUNE, leader of the Black Cabinet and head of the National Council of Negro Women, inviting her to the White House over the protest of white southern Democrats.

Although the Harlem Renaissance that defined “the New Negro” as poised and self-reliant was winding down by the end of the 1920s, it prompted many writers to continue producing. Writer and folklorist ZORA NEALE HURSTON published her best works during the depression decade of the 1930s, most importantly *Their Eyes Were Watching God* in 1937. The saga of the strong-willed, independent Janie’s journey of self-discovery attracted considerable attention. Even better known was RICHARD WRIGHT’s 1940 novel *Native Son*, a gripping examination of the effects of racial oppression upon a hapless young man named Bigger Thomas and the black community around him. The JAZZ that flourished during the Harlem Renaissance continued to influence American MUSIC as more and more whites listened to the swing music of DUKE ELLINGTON, Count Basie, Cab Calloway, and many others.

Despite such obvious achievements, life was often grim for African Americans. In the infamous 1931 SCOTTSBORO BOYS case, nine black youths were unjustly accused of raping two white women while riding a freight train through Alabama. Their hasty convictions and death sentences illustrated the inequalities of the justice system, especially but not exclusively in the South, where lynch law remained a problem. (Twice, however, the Supreme Court overturned the Alabama decisions and ordered retrials, and eventually all nine regained their freedom.) During the 1930s and 1940s, black workers encountered continuing resistance

from LABOR unions in gaining admission. The new CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO) was often helpful, however, and black workers were able, for example, to gain increased entry in the AUTOMOBILE INDUSTRY with the support of the United Automobile Workers.

The depression that caused so much havoc hit African Americans well before it descended upon the rest of the country. By the time the stock market crashed in 1929, many black workers were already experiencing hard times—and things then got worse, as black Americans were laid off from jobs in disproportionately high numbers. By 1932, half the black workers in the urban South were out of work. In 1934, roughly two of every five black workers were unemployed, twice the national level. Black farmers and farm workers in the South similarly saw a bad situation turn worse.

New Deal programs aided distressed blacks and reestablished federal government support of African Americans, though typically with limits and discrimination. The CIVILIAN CONSERVATION CORPS (CCC), for example, maintained segregated facilities but, nevertheless, employed young black men. The NATIONAL YOUTH ADMINISTRATION (NYA) had programs for black youths, though kept them separate from whites. The NATIONAL RECOVERY ADMINISTRATION (some blacks said NRA stood for “Negroes Ruined Again”) countenanced racial disparities in wages. Agencies granting mortgages and business loans extended them to blacks with the proviso they live and operate in segregated areas. The AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA) gave little support to black farmers in the South. Blacks were included in New Deal RELIEF programs, though often the help given was not commensurate with need.

Given the status of race relations at the time, New Deal support of African Americans, limited and uneven though it may have been, provided an important start for government intervention on behalf of blacks. Racial discrimination in New Deal programs often came at the local level, in the North as well as the South, and New Deal officials found it difficult to overcome resistance—though many did not try. Important members of the Roosevelt administration, including Harold Ickes and HARRY HOPKINS, did, however, urge more attention to blacks and to racial prejudice, as did Eleanor Roosevelt.

World War II brought more and better jobs to black workers. First fired during the Depression, blacks were typically last hired during wartime economic MOBILIZATION, but the shortage of workers did eventually lead to their increased presence in the industrial work force. Roughly one million black men and women served in the armed forces, and the U.S. ARMY and U.S. NAVY began to relax some of the discrimination and segregation that marked the wartime military. Black GIs fought with distinction under

Shown here are Negro Air Corps cadets in an advanced flying class. (*National Archives*)

General GEORGE S. PATTON. Best known were the Tuskegee Airmen, the “Fighting 99th” Pursuit Squadron, organized in 1941, and the 332nd Fighter Group. Trained under separate and adverse conditions, these airmen proved their abilities time and again, both as escorts and active fighters. In Europe, the army experimented with platoon-level troop integration. Despite its success, the policy was largely abandoned until President Harry S. Truman desegregated the military.

On the home front, A. PHILIP RANDOLPH, president of the BROTHERHOOD OF SLEEPING CAR PORTERS, pressured Roosevelt to end discrimination in the defense mobilization effort with his 1941 MARCH ON WASHINGTON MOVEMENT (MOWM). Randolph threatened a march of as many as 100,000 black protestors in the nation’s capital if the president did not take corrective action against discrimination in defense hiring and the armed forces. Not wanting international embarrassment, FDR issued EXECUTIVE ORDER 8802 in June 1941, banning discrimination in

government and government contractors and establishing the FAIR EMPLOYMENT PRACTICES COMMITTEE (FEPC) to enforce the order. The wartime labor shortage probably made more difference in increasing black employment, but these were important steps.

In other ways, too, black protest increased during the war. Such protest was fueled by the irony African Americans felt in the nation fighting a war against the Nazis and their master race philosophy under America’s own system of racial supremacy. Black newspapers thus publicized the “Double-V” campaign—victory abroad over the AXIS but also victory at home over Jim Crow. The NAACP grew from 50,000 to 450,000 members during the war. Though some protest took place in the South, the renewed migration of blacks out of the rural South and toward the centers of defense industry in the North and on the West Coast gave blacks more opportunity for activism than in the repressive South. And given prejudice and discrimination in the North as well as the South, they had reason for protest.

Black-white tensions remained high, and sometimes increased, as African Americans moved to crowded war-boom cities. Municipal police forces often acted more like occupying armies in the “colored sections” of American cities. Whenever blacks left these ghettos, even for employment or school, they were regarded with suspicion and harassment. Vicious race riots broke out in 1943 that left many dead in Harlem and Detroit over discrimination that underscored the reluctance of white America to accede to any more than minimal racial opportunity. The massive and enormously important examination of America’s racial problem in the 1944 two-volume study by the Swedish economist GUNNAR MYRDAL, *An American Dilemma*, put the onus for racial problems squarely on white shoulders and set the tone for racial inquiry for years to come.

The difficulties, disappointments, and frustrations of the Great Depression and World War II, and also the progress, changes, and hopes of the era, contributed to a surge of determination that World War II had provided the opportunity for equality for which blacks had long been waiting. The result was the postwar Civil Rights movement. The first signal accomplishment of the decades-long struggle to reverse legalized Jim Crow came with the unanimous Supreme Court decision in *Brown v. Board of Education* (1954) reversing *Plessy v. Ferguson* (1896) that had sanctioned racial segregation.

### Agricultural Adjustment Act (1933)

President FRANKLIN D. ROOSEVELT signed the Agricultural Adjustment Act into law on May 12, 1933, during the first Hundred Days of the NEW DEAL. The result-

ing AGRICULTURAL ADJUSTMENT ADMINISTRATION was, together with the NATIONAL RECOVERY ADMINISTRATION for industry, central to the effort of the FIRST NEW DEAL of 1933 to achieve economic recovery by means of planning and controls.

By 1933, American AGRICULTURE was in crisis. Overproduction and declining foreign markets after World War I had resulted in low prices and profits for American farmers during the 1920s. The 1929 AGRICULTURAL MARKETING ACT of the HOOVER PRESIDENCY proved unable to curtail production or protect prices, and then the GREAT DEPRESSION produced disastrous conditions for farmers. By 1933, farm income had fallen by some 60 percent from 1929, hundreds of thousands of farm mortgages were being foreclosed, and small farmers were in an especially desperate situation. The farmers’ plight had become so desperate that loud and sometimes violent protests erupted throughout rural America, and a number of agricultural states passed moratorium laws preventing farm foreclosures.

With farmers roughly one-fourth of the work force and agriculture vital to the nation’s ECONOMY, a variety of solutions were suggested to ease the farmer’s plight. One idea was to use the protective tariff to reserve the U.S. agricultural market for American farmers, and have a government agency “dump” surplus crops onto foreign markets. A second idea was simply to have farmers cut back on production in order to free themselves from surpluses that depressed prices, with the federal GOVERNMENT “advising” the agricultural sector. Some argued for currency inflation to raise the price of farm goods. Montana State College economist M. L. Wilson offered another approach, the domestic allotment plan, in which the federal government would pay farmers who voluntarily reduced acreage of certain crops and would finance the program by taxing the processors of farm products. As the situation deteriorated, the new concept of domestic allotment found increasing favor among many farming authorities. Eventually the most vocal exponent became HENRY A. WALLACE, editor of *Wallace’s Farmer*, who advocated its adoption in numerous farm publications. In 1932, Wallace convinced a Chicago conference of farm leaders and economists of not only the concept’s validity but also its relevance to solving the widespread problems. His visibility on the issue and the urgency with which he addressed it also brought him to the attention of incoming president Franklin D. Roosevelt, who considered him for a cabinet appointment.

Roosevelt and his new administration had a particular concern about agriculture in order to achieve a balanced economy and restore prosperity. FDR had endorsed the domestic allotment plan during the ELECTION OF 1932, influenced by agricultural advisers Henry A. Wallace and REXFORD G. TUGWELL. After his election, Roosevelt met with farm leaders, expressed his support for wide-ranging

## 6 Agricultural Adjustment Act

agricultural legislation, and directed Wallace to draft a bill for introduction into CONGRESS. Wallace drew up legislation that incorporated a variety of approaches, and soon after its submission in March, the House of Representatives passed the bill without change. To head off efforts by Senate inflationists to include the unlimited coinage of silver in the bill, Roosevelt endorsed legislation introduced by Democratic senator Elmer Thomas of Oklahoma giving discretionary authority to increase the money supply by reducing the gold content of the dollar, by coining silver, or by issuing up to \$3 billion in paper money not backed by precious metal of any kind. With the Thomas amendment, Congress passed the Agricultural Adjustment Act on April 28, 1933, and Roosevelt signed the bill on May 12.

The Agricultural Adjustment Act had three sections. Title I was the domestic allotment plan, in which the government entered into agreements with growers of basic commodities (corn, cotton, hogs, milk, rice, tobacco, wheat) to reduce production. Producers would receive a “parity” price, which provided the same purchasing power farmers had enjoyed during the so-called golden age of agriculture from 1909 to 1914. This would be financed initially by \$100 million and then by taxes on farm processors (millers, canners, and the like). Title II provided for federally funded emergency, low-interest mortgage payments to farmers who faced foreclosure and eviction from their homes and land, an issue of immediate importance because of growing agricultural debt, attempts to “stave off the sheriff,” and threats of a nationwide farmers’ strike. Title III incorporated the Thomas amendment, and in addition, the bill created the Agricultural Adjustment Administration (AAA), which would oversee New Deal farm policy.

Secretary of Agriculture Henry Wallace named George N. Peek, a farm implements manufacturer who had championed the plan to dump farm surpluses abroad, as AAA administrator. Following disagreements with Wallace over AAA policy, Peek was fired in December 1933 and replaced by Chester Davis, who supported the acreage reduction approach. By 1934, more than three million farmers were participating in AAA programs, organized into more than 4,000 local associations at the county level, especially in Midwestern states, to implement production controls. Together with other New Deal farm programs—the FARM CREDIT ADMINISTRATION to save farm mortgages, for example—the AAA helped stabilize American agriculture.

From the beginning, however, the AAA was embroiled in controversy involving both external criticism and internal dissension. With AAA payments going largely to big farmers and landlords, who often took land out of production that was being farmed by tenants, sharecroppers, and other small farmers, a number of critics complained that the AAA ignored suffering small farmers. NORMAN THOMAS, other SOCIALISTS, and the SOUTHERN TENANT FARMERS UNION

that they helped found criticized the AAA for neglecting the rural Southern poor, especially sharecroppers. Inside the AAA, a group of liberal reformers led by Legal Division head Jerome Frank attempted to shift policy to give more help to tenant farmers but were fired in 1935 by Chester Davis, who feared alienating big farmers and their powerful (largely southern) allies in Congress.

Critics of the AAA also included agricultural processors, who objected to the processing tax. The constitutionality of the levy was at issue when the SUPREME COURT, in January 1936, struck down the processing tax—and the Agricultural Adjustment Act itself—ruling that such a tax was an improper exercise of the federal government’s power. The Court also held that agriculture was local production and did not fall under the regulatory power of Congress, which had authority only over interstate commerce, not local production or intrastate commerce.

Congress moved quickly to pass a new farm bill in 1936, the Soil Conservation and Domestic Allotment Act, that provided benefits to farmers who practiced soil conservation (and limited the production of staple cash crops) by growing such soil-building crops as grasses rather than soil-depleting crops like wheat and cotton. However, the program failed when an insufficient number of farmers signed on to voluntary production limits. Consequently, in 1936 cotton yielded a bumper crop that further depressed market prices. Farmers producing wheat, corn, and tobacco also suffered low prices brought on by overproduction. But Secretary Wallace, rather than consider demands for higher subsidies, fewer production restrictions, and dumping surpluses abroad, worked with the president to devise new remedies. In 1938, Congress passed another Agricultural Adjustment Act, which eliminated processing taxes, allowed compulsory production controls (if they were approved by the farmers themselves), established the ever-normal granary plan allowing the government to advance loans on surplus crops at prices slightly below parity levels, and implemented federal crop insurance. It also established four regional laboratories in California, Illinois, Louisiana, and Pennsylvania that specialized in agricultural research for improving soil quality and enhancing productivity. In March 1938 the government sponsored elections for farmers to vote on the new compulsory marketing quotas, and they passed overwhelmingly. But even with these new restraints, crop surpluses continued multiplying, and the government found it necessary to dump vast quantities of wheat and cotton on foreign markets throughout 1938 and 1939.

Though the Agricultural Adjustment Act helped big farmers more than small ones and though the recovery of farm prices and the agricultural sector owed at least as much to drought and then to heightened demand during WORLD WAR II as it did to AAA policy, the Agricultural

Adjustment Act of 1933 and its successors laid the foundations for American farm policy in the postwar era.

Perkins, *Crisis in Agriculture: The Agricultural Adjustment Administration and the New Deal* (Berkeley: University of California Press, 1964); Theodore Saloutos, *The American Farmer and the New Deal* (Ames: Iowa State University Press, 1982).

—William J. Thompson

### Agricultural Adjustment Administration

When the GREAT DEPRESSION struck in 1929, AGRICULTURE had been reeling from overproduction and declining commodity prices since the end of World War I. To this crisis was now added massive national UNEMPLOYMENT, reduced markets abroad, and the rising expenses and credit necessary to operate modern, highly mechanized farms. The administration of President FRANKLIN D. ROOSEVELT was determined in its efforts to assist struggling farmers and make farming once again profitable, but it had first to surmount deep-seated constitutional and ideological objections to enlarging the federal government's role in daily life. Yet, CONGRESS convened an emergency session on March 9, 1933, to try to head off a complete collapse of the nation's agricultural industry. The result was passage of the AGRICULTURAL ADJUSTMENT ACT on May 12, 1933, which established the Agricultural Adjustment Administration (AAA). This enacted several novel ideas that had been floated throughout the 1920s but not enacted, including voluntary production limitations for cotton, corn, wheat, hogs, tobacco, rice, and dairy products, which were invoked to drive up commodity prices. Moreover, participating farmers were subsidized by the federal GOVERNMENT for letting fields lay fallow and reducing their herd size. The government, which had levied a new tax on industrial processors of the aforementioned products, would mail farmers a monthly check based on the "parity" price ratios of the pre-World War I era. In effect, farmers would be paid not to produce certain crops. The government anticipated that through such voluntary reductions, parity prices for key commodities would be achieved and a pending collapse of the farming sector averted.

Implementation of the AAA's program may have been well-intended, but it triggered a firestorm of public criticism. Coming at a time when workers were hard-pressed to find employment, many were outraged that the government enacted policies specifically designed to make basic necessities like food more expensive. Many of the programs also struck others as extremely wasteful in a time

of general shortages. Slaughtering 6 million pigs and then disposing of their remains, along with ploughing under 10 million acres of cotton, may have made sense economically, but it rankled public opinion and further stoked conservative opposition to what was perceived as rising tyrannical bureaucracy. In practice, AAA policies primarily benefited the major planters and growers, who received large subsidies from the government, purchased additional tractors and machinery, and laid off unskilled laborers. Small farmers gained precious little to remedy their plight, and many accused the AAA of serving the interests of the American Farm Bureau Federation, which represented large commercial farmers. Nonetheless, millions of participants signed up by 1934, since a government check had become their only guaranteed source of income. That year the program was expanded to add barley, rye, peanuts, flax, cattle, and sorghum to the list of basic commodities subject to production limits.

Despite vocal criticism among conservative politicians, the AAA found its greatest challenge in the courts. On January 6, 1936, the U. S. SUPREME COURT found the act in violation of the Tenth Amendment to the Constitution and declared it unconstitutional. The Court held that farm problems were local in nature, not national, and therefore lay beyond the realm of congressional authority. The Roosevelt administration reacted quickly by passing the Soil Conservation and Domestic Allotment Act on February 29, 1936. This new bill had essentially the same objectives as the AAA, for it paid farmers to take acreage out of production—but now in the name of soil conservation. Where crops were grown, greater emphasis was placed on soil-building plants such as grass and legumes. Furthermore, all land laying fallow would be leased to the government, which subsequently made subsidies in the form of rent payment to participants. Stiff production quotas were also imposed on specific crops once two-thirds of all farmers had agreed to participate. However, despite the government's best efforts, 1936 proved a bumper crop for cotton, and prices collapsed. Wheat, corn, and tobacco production also rose so that prices remained depressed. Two years later Congress was forced to pass a new Agricultural Adjustment Act, which funded the program through general revenues instead of processing taxes. The Commodity Credit Corporation was also created to make loans on surplus crops just below parity prices and also allowed farmers to store crops at government expense until market prices hit or exceeded parity levels.

All told, the AAA failed to solve the agricultural sector's principal problem: huge crop surpluses. Moreover, farm commodity prices rose only to about 80 percent of parity prices by 1939. Large farmers profited most, at the expense of tenants, sharecroppers, and farm workers. But government subsidies nonetheless allowed average farming

## 8 Agricultural Marketing Act

households to double their annual income by 1940, and the infusion of \$4.5 billion throughout the crisis proved sufficient to forestall a major agricultural collapse. Farmers' prospects brightened considerably with the onset of WORLD WAR II, when focus of the AAA shifted to maximum production to meet wartime demands. And, thanks to their previous efforts at helping preserve the agricultural industry, American farmers proved fully capable of dramatically expanding food production and feeding the nation and many of its allies for the duration of the conflict. In sum, the AAA was hardly a completely successful story, but direct government subsidies have since become a standard feature of modern American agribusiness.

### Agricultural Marketing Act (1929)

The Agricultural Marketing Act of 1929 was the effort, ultimately unsuccessful, of the HOOVER PRESIDENCY to solve the problem of overproduction and declining prices that had afflicted American AGRICULTURE in the 1920s.

As he had promised during his 1928 campaign for the White House, President HERBERT C. HOOVER made addressing the farm problem one of the priorities of his administration. He convened a special session of CONGRESS in April 1929 and asked for a new agricultural policy, but one that would not rely on GOVERNMENT taxes and subsidies as had the proposed McNary-Haugen bills of the 1920s. Consistent with his philosophy of government, Hoover also wanted a farm policy that rested upon private and voluntary efforts, with government providing assistance but not imposing controls.

On June 15, the Agricultural Marketing Act was signed into law. It created a Federal Farm Board, funded at \$500 million, to provide technical assistance to farmers and to lend money to support existing agricultural cooperatives and establish new ones. The cooperatives could buy equipment more cheaply than individual farmers; they could coordinate voluntary production agreements among farmers; and they could manage sales to keep prices up and middlemen charges down. The cooperatives could also form crop stabilization corporations that were eligible for Farm Board

loans to enable them to buy surplus crops, store them, and put them on the market in an orderly fashion that would keep prices as high as possible.

The Agricultural Marketing Act was a creative and unprecedented effort to address the problems of farmers, and one that avoided direct government intervention to curtail production or support prices. Yet it failed because it lacked adequate power over production—and also sufficient funds for the stabilization corporations to take the mounting farm surpluses off the market, despite what seemed the huge sum of \$500 million. The situation was made more difficult by the fact that in such staple crops as wheat and cotton there was a glut on the world, not just the national, market. American farmers (and also those abroad) continued to produce at high levels, the onset of the GREAT DEPRESSION reduced consumer spending, and the Farm Board's resources were soon overwhelmed. In 1931, the Farm Board and key stabilization corporations abandoned efforts to keep surpluses off the markets. Prices plunged still further, and the crisis in agriculture grew worse. With the defeat of Hoover in the ELECTION OF 1932, it fell to the new president, FRANKLIN D. ROOSEVELT, and the AGRICULTURAL ADJUSTMENT ACT of 1933 to deal with the problem of farm production and farm prices.

**Further reading:** David E. Hamilton, *From New Day to New Deal: American Farm Policy from Hoover to Roosevelt, 1928–1933* (Chapel Hill: University of North Carolina Press, 1991).

### agriculture

The period from 1929 to 1945 brought major changes to American agriculture. The onset of the GREAT DEPRESSION dramatically worsened the difficulties that many American farmers had experienced in the 1920s. From 1929 to 1933, despite efforts of the HOOVER PRESIDENCY, farm income plummeted and small farmers in particular experienced great hardship. The AGRICULTURAL ADJUSTMENT ACT and other NEW DEAL measures provided assistance and created a new and permanent role of the federal GOVERNMENT in agriculture. WORLD WAR II then brought recovery to the agricultural sector as well as to the ECONOMY overall. The events of the depression and the war also hastened MIGRATION out of rural America, spurred technological change, and augmented the economic and political power of large agribusiness. Thus, in a number of ways, American agriculture was significantly different in 1945 from what it had been in 1929.

When the Great Depression struck in 1929, many farmers were already suffering from hard times that had marked much of the 1920s. After World War I, increased domestic agricultural production, growing competition in

world markets, and declining demand for American agricultural products, combined to drive many agricultural prices, especially in such staple products as cotton and wheat, to extremely low levels. Farmers who saw their incomes shrink typically attempted to make up the difference by increasing production, which, in the absence of new markets, only drove down prices even further. Many small farmers had difficulties paying taxes and mortgages, and foreclosures and tenancy increased.

By the mid-1920s, most analysts realized that the best way to increase agricultural prices was to reduce or eliminate the growing agricultural surpluses. CONGRESS twice passed versions of the McNary-Haugen bill, designed to reduce agricultural surpluses and raise domestic prices by creating a government corporation to purchase surplus agricultural products and sell them on the world market at greatly reduced prices. President Calvin Coolidge vetoed both McNary-Haugen bills on the grounds that they involved improper federal subsidy of agriculture and would invite economic retaliation from other nations.

Coolidge's successor, President HERBERT C. HOOVER, then made the agricultural problem an early top priority of his administration. In June 1929, Hoover signed the AGRICULTURAL MARKETING ACT, which authorized the president to appoint a Federal Farm Board, funded at \$500 million, to help farmers create marketing cooperatives that might regulate production and sales of farm goods and thus keep prices up. Although the legislation marked a significant new departure, it relied upon voluntary action by farmers and lacked sufficient funds. Production therefore continued to rise and commodity prices and farmer incomes continued to fall—disastrously so, once the depression hit.

The net income of American farmers plummeted from \$7 billion in 1929 to only \$2.5 billion in 1932. By 1930, more than 25 percent of farmers produced less than \$600 worth of farm products a year, and an even higher percentage lived in primitive and isolated conditions. Few farmers even had electricity or running water. Farm tenancy rose sharply again in the early 1930s with new waves of foreclosures because of farmers' inability to pay their taxes and mortgages. By 1933, banks were foreclosing on some 20,000 farm mortgages monthly, and thousands of small, undercapitalized country banks had failed, while thousands were barely solvent. With farmer incomes dropping and with land values down by 40 percent, the chances that farmers would be able to secure additional sources of funding quickly vanished. As the Great Depression worsened, farmers experienced abandoned homesteads, collapsing prices, longer working hours, buildings and equipment in disrepair, a lack of cash or credit, and a rising wave of political discontent.

Compounding this economic disaster was an ongoing environmental one. Overfarming, overgrazing, and overtill-

age depleted the soil of moisture and nutrients, resulting in accelerated topsoil loss. This trend was further exacerbated by the onset of prolonged and destructive dry spells commencing in 1931, with recurring episodes in 1934, 1936, and 1939–40. In fact, poor management of arboreal areas and the ensuing loss of trees allowed winds to gradually remove and redeposit millions of tons of fertile topsoil. The region hardest hit involved 27 states ranging from the Great Plains to the SOUTH and Southwest, whose distress only complicated already depressed conditions there. Many small farmers, faced with the prospect of working parched earth, simply abandoned their plots and allowed the winds to carry off more valuable topsoil. In April 1935, a massive dust storm blanketed 100 million acres across the Midwest and West. The ensuing "DUST BOWL" conditions, replete with crop failures, livestock die-offs, and respiratory ailments, finally triggered the wholesale abandonment of subsistence farms. This flight culminated in the migration of hundreds of thousands of "Okies," or dispossessed dirt farmers, to California in search of better lives.

By the time FRANKLIN D. ROOSEVELT assumed the presidency in March 1933, the economic crisis of American agriculture had thus reached crisis proportions. The sheer magnitude of the crisis prompted Roosevelt to propose direct federal intervention to return agriculture to prosperity. The strategy and programs he gradually adopted involved government planning, production, distribution, and financial subsidies, all on a scale never previously attempted by any administration. The centerpiece of the New Deal agricultural policy of Roosevelt and Secretary of Agriculture HENRY A. WALLACE was the AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA). Created in 1933 by the Agricultural Adjustment Act, this agency attempted to raise agricultural prices to what was called "parity." This meant that prices of agricultural and nonagricultural goods would have the same relation as they did in the "golden age of agriculture" baseline years from 1909 to 1914, and thus farmers would gain more actual purchasing power. To accomplish this, the AAA made benefit payments to farmers for limiting acreage under production—in effect paying farmers not to produce the surpluses as well as raising prices by limiting production. AAA helped reduce surpluses and raise prices, though it assisted large farmers more than small ones, and tenants, sharecroppers, and farm laborers often got little or no help.

In January 1936, the SUPREME COURT invalidated the Agricultural Adjustment Act, on grounds that the processing tax used to raise money for the benefit payments was unconstitutional and that agricultural production was local production beyond the power of the federal government to regulate. In February 1936, Congress responded by passing the Soil Conservation and Domestic Allotment Act, which paid farmers to take land out of production—but ostensibly

## 10 agriculture

to conserve soil, not limit production—with the money to come from the government's general fund rather than from a processing tax. The net effect of these programs rendered many farmers better off than they had been four years earlier, even if the improvement was only marginal. Consequently, they delivered some three-fifths of the farm vote to Roosevelt's reelection bid in 1936.

In February 1938, Congress passed another Agricultural Adjustment Act. This new law expanded the soil conservation programs under the Soil Conservation and Domestic Allotment Act. It offered crop insurance to wheat producers to protect them against drought, and gave the secretary of agriculture power to authorize crop loans and impose marketing quotas. It also approved the idea of Secretary of Agriculture Wallace to develop an "ever-normal granary," which would be used to store surplus crops, thereby taking surpluses off the market and ensuring adequate food in the event of a crop failure.

A number of other New Deal programs also sought to help farmers. In May 1933, President Roosevelt created the FARM CREDIT ADMINISTRATION to help increase the amount of credit available to farmers and make it easier for farmers to pay off debts. That same month Congress established the TENNESSEE VALLEY AUTHORITY, which built dams, improved flood control, implemented better land-use practices, and brought cheap hydroelectric power to farmers in the Tennessee Valley. In October 1933, the president created the Commodity Credit Corporation, which allowed farmers to borrow money from the federal government with the understanding that if commodity prices did not rise, the government would take a farmer's crops in lieu of the unpaid loans and would still be willing to lend money to the farmer in the following year.

In April 1935, Roosevelt established the RESETTLEMENT ADMINISTRATION to relocate struggling farmers from submarginal land that had been depleted by overfarming, mining, and drought, to new land with fertile soil. In 1937, the Resettlement Administration was absorbed into the FARM SECURITY ADMINISTRATION, which also provided farmers with debt reduction assistance, technical support, and loans to buy land or equipment. The RURAL ELECTRIFICATION ADMINISTRATION, which the president established in May 1935, brought electrical power to millions of farmers by making low interest loans to private electrical companies if they agreed to extend their power lines into thinly populated RURAL AREAS.

Ultimately, the expansion of electric service revolutionized life in rural America. In 1934, only 10 percent of American farms had electricity; by 1950, more than 90 percent did. Nonetheless, chronic difficulties, the depression, the dust bowl, and then the new industrial jobs produced by World War II led to a significant migration of people from rural to urban America that reinforced the long-term

redistribution of the population toward urban areas. From 1930 to 1950, the number of people working in agriculture fell from 10.3 million to 7.5 million—and from 23 percent to 12 percent of the nation's workers.

Advances in SCIENCE, TECHNOLOGY, and MEDICINE AND PUBLIC HEALTH in the 1929–45 era helped to resolve problems that had long beset agriculture. Traditionally, farmers could only watch as diseases killed their animals and crops, insects ate their harvests, and weeds overtook their pastures. Drought, frost, or storms could easily destroy an entire year's harvest in a matter of days. These situations cost American farmers millions of dollars each year, and for the growing number of farmers living on the verge of financial ruin in the 1930s, a natural disaster could easily mean the difference between impoverishment and economic prosperity.

In 1928, Alexander Fleming discovered penicillin, which by the end of World War II had replaced sulfa drugs as the principal antibiotic used in America and allowed the United States to bring under control many diseases, such as bovine tuberculosis, that had ravaged livestock as well as people for centuries. In 1943, a Swiss company also introduced the insecticide DDT to America, and two years later, the United States began marketing the herbicide 2,4-dichlorophenoxyacetic acid (shortened to 2,4,-D in 1945). Furthermore, the development of better plant varieties and fertilizers allowed American farmers to double, and in some cases even triple, the yields of some crops. Improved livestock care and breeding techniques also increased the amount of meat and milk animals produced. And the use of tractors and other labor-saving devices not only sharply reduced the need for manual labor, but also reduced the time needed for planting, harvesting, and general upkeep—and contributed to the migration of farm workers from rural to urban areas.

Lastly, advances in TRANSPORTATION—along with new food processing techniques, such as the large-scale use of metal cans and frozen foods—made it easier to preserve food for long trips. This helped to produce new food distribution methods, such as the emergence of large supermarket chains, as well as changes in the nation's diet. Because of these transformations, agricultural production continued to rise even as the number of people engaged in agriculture continued to fall. By the end of World War II, a farmer in the United States could produce enough food to feed 12 people, up from only seven people in 1910.

World War II had a powerful impact on American agriculture. Millions of poor farmers looking for new opportunities left the farm and entered the military or took jobs in the nation's rapidly growing defense plants and shipyards. Moreover, after years of urging farmers to reduce production, the government, using draft exemptions as well as subsidies and exhortation, now found it necessary

to encourage farmers to increase production in order to ensure that America had enough food for military and civilian needs. Indeed, the war did what two decades of federal farm policies had been unable to do—eliminate agricultural surpluses and raise commodity prices.

Congress passed the LEND-LEASE Act in March 1941, which sent Great Britain much-needed food and material. In May 1941, Great Britain and the United States formed the Anglo-American Food Committee, and in June 1942, the Combined Food Board, to coordinate food shipments to the Allies. Soon the federal government became the chief food buyer in the United States. The rise in demand caused agricultural prices to rise sharply during the war, and farm income more than doubled. For the first time since World War I, American farmers enjoyed the financial freedom to pay off debts, restore their credit, purchase needed and wanted goods, and put money in the bank. Yet, despite these good times, millions of agricultural workers and sharecroppers were removed from the land, either by the military draft or migration to the cities. The lure of good wages brought them to defense plants, munition factories, and shipyards across the nation. Afterwards, many chose to remain rather than return to the farmland.

However, most farmers remembered how agricultural surpluses after World War I had driven down commodity prices, and wanted some assurance that they would be protected from falling prices at the end of the war. Congress provided the first of many such assurances in May 1941 when Senator John H. Bankhead of Alabama pushed an amendment through Congress guaranteeing farmers that prices for corn, wheat, cotton, rice, and tobacco would be at least 85 percent of what they had been during the AAA's "parity" baseline years. Two months later, Congress extended this guarantee to include all agricultural goods produced for the war effort. The U.S. government also used cash incentives and subsidies to encourage farmers to produce scarce commodities and keep the cost of living down. Nevertheless, because the need for food was so high and supply could not keep up with demand, the government used price controls to combat inflation—though, pressured by the "farm bloc," Congress exempted farm goods from price controls until they had reached 110 percent of the parity level.

Traditionally, rural poverty has been a chronic problem in the United States. But the economic developments of the depression and World War II together with new federal programs begun by the New Deal helped raise commodity prices and lift millions of rural people out of poverty, often by means of migration to metropolitan areas. After World War II, Washington continued to play an important and increasing role in American food production as new challenges and changing world markets began to confront American farmers. Moreover, the impact of the Great

Depression and World War II meant that direct government subsidies and regulations became a staple of American agribusiness well into the 21st century.

### aircraft carriers

The U.S. NAVY began experimenting with aviation platforms as early as the Civil War, when observation balloons were tethered and launched from moored vessels. However, experiments with heavier-than-air craft did not formally commence until the 20th century following the development of viable airplanes. On November 14, 1910, civilian pilot Eugene B. Ely conducted the first ship-launch by flying his wooden biplane from a wooden platform rigged to the cruiser USS *Birmingham*. On January 18, 1911, Ely reversed the process by successfully landing his craft on a platform affixed to the cruiser USS *Pennsylvania*. But over the ensuing decade, the navy apparently lost interest in ship-based aircraft operations, preferring instead to concentrate on the development of large flying boats. It thereby fell upon the Royal Navy to develop the first functional aircraft carriers during World War I. Their success prompted the U.S. Navy to resume developments in this field, and in 1919 the collier USS *Jupiter* was converted into the first American aircraft carrier, the USS *Langley*. The new vessel was commissioned in 1922 and began training the first generation of naval aviators versed in carrier deck operations. This proved so successful that in 1927 two large 33,000-ton cruisers underwent conversion and went into service as the carriers USS *Lexington* and *Saratoga*. Throughout the 1930s both ships were employed in various fleet exercises and demonstrated how effectively carriers could project military force far beyond the range of the fleet escorting them. Concurrently, a new generation of carrier-based airplanes such as all-metal fighters, dive

USS Essex (CV 9) underway in May 1943 (*Naval Historical Foundation*)

bombers, and torpedo planes underscored the realization that the next naval war would be strongly affected by air power.

By the time of the Japanese attack on PEARL HARBOR on December 7, 1941, the Navy fielded eight carriers of various sizes and capabilities. Moreover, the destruction of the American battle fleet left aircraft carriers as the only method of carrying the war to the enemy in the Pacific. The soundness of American tactical doctrine and the importance of aircraft carriers were clearly manifested in the BATTLE OF THE CORAL SEA in May 1942, the first naval engagement where neither fleet engaged the other directly. The ensuing BATTLE OF MIDWAY in June proved a decisive victory for the United States, which sank four Japanese carriers. Thereafter, the tactical supremacy of aircraft carriers in naval warfare was readily accepted and

the navy embarked on an accelerated program to acquire more. By 1945 it possessed some two dozen heavy (CV) *Essex*-class carriers, which were 888 feet in length, carried nearly 100 aircraft apiece, and displaced 36,000 tons. These vessels effectively tipped the strategic and tactical balance of the Pacific naval conflict. To these were added nine additional light carriers (CVL), constructed from light cruiser hulls and 112 escort carriers (CVE), converted from transport vessels. The latter class, while unspectacular as combat vessels, worked as part of submarine hunter-killer groups and proved decisive in driving German U-boats from the Atlantic Ocean. By war's end two huge 45,000-ton carriers, the *Franklin D. Roosevelt* and the *Coral Sea*, were under construction and joined the fleet in 1947. Since the end of WORLD WAR II aircraft carriers have figured prominently in American naval strategy,

and the U.S. Navy continues to operate the world's largest and most effective carrier fleet.

### aircraft industry

After the growth of aviation for both business and pleasure during the 1920s, the aircraft industry was hit hard by the onset of the GREAT DEPRESSION. Passenger travel nonetheless increased during the decade, and as WORLD WAR II approached, growing military demands for aircraft began the enormous wartime expansion of the industry. By the end of World War II, the importance of AIR POWER in modern warfare had been established, and aviation was poised to become an increasingly important component of American TRANSPORTATION.

The so-called Lindbergh Boom in the civil aircraft industry, associated with the famous transatlantic flight, peaked in 1929. Just a few years later, many aircraft manufacturers were bankrupt, and the total value of industry production plummeted from \$91 million in 1929 to \$33 million in 1933. GOVERNMENT policy then played an increasingly important part in the operations of the aircraft and airline industries during the 1930s. Government mail contracts were a major source of airline revenue, and the military purchases helped sustain aircraft production. New technologies developed by the National Advisory Committee for Aeronautics brought improvements in aircraft manufacturing. Better airframe construction enabled airlines to expand their passenger business and rely less on government contracts. In 1938, the federal government established the Civil Aeronautics Authority to oversee aviation, while the government also built and operated ground facilities for air traffic control.

Despite the economic hardships of the 1930s, the decade proved one of the most fruitful and innovative in terms of new technologies destined to improve the safety and performance of all aircraft. The most conspicuous change was the gradual replacement of wood with metal, which conferred greater strength and reliability to the airframes. The first airliner so endowed, the Boeing 247,

flew in February 1933 as a streamlined, low-wing, all-metal machine. Other innovations include scientifically streamlined engine cowlings for greatly reduced drag, high-octane aviation fuel for improved engine performance, variable pitch propellers that automatically adjusted to speed and RPM settings, and increasing use of wing flaps to assist both take-offs and landings. Cockpits were likewise revolutionized by canopies to enclose by them, use of pressurization for high altitudes, automatic piloting, artificial horizons, and turn and bank indicators, all of which enhanced pilot performance and airplane safety. These changes made the United States a world leader in the rapidly expanding field of commercial aviation. In 1938 these developments necessitated the rise of a new bureau, the Civil Aeronautics Authority (CAA), which promoted development of advanced airliners and safer air traffic control procedures in this rapidly expanding field.

By the late 1930s, the aircraft industry had begun to recover economically. The value of industry production increased to nearly \$200 million in 1938 and \$370 million by 1940. This was due in part to increased passenger travel, which grew from fewer than 400,000 passengers in 1930 to more than 2.5 million in 1940. In the mid-1930s, Douglas Aircraft began producing the venerable DC-3 airliner, which accounted for the great majority of air passengers by the end of the decade. This aircraft, by dint of high speed and passenger capacity, revolutionized air travel prior to World War II. Douglas manufactured more than 11,000 units, many of which, by dint of ruggedness and reliability, still fly commercially in the 21st century. But by 1940, the rise in industry sales came mostly from the demand for military aircraft. In November 1938, President FRANKLIN D. ROOSEVELT told advisers that he wanted the aircraft industry to expand production to supply the British and the French and to provide the American air corps with 10,000 aircraft. Despite criticisms from ISOLATIONISTS and others worried about possible violations of the NEUTRALITY ACTS, American aviation helped meet the needs of the British and the French.

In January 1939, Roosevelt asked Congress for a \$300 million special appropriation for aircraft construction, signaling the start of the American rearmament program. After the Nazi BLITZKRIEG overran western Europe in the spring of 1940, Roosevelt in May set a stunning production goal of 50,000 planes a year, in part to cover French and British requirements. Following PEARL HARBOR and American entry into the war, FDR increased his goals still further—to 60,000 aircraft in 1942 and 125,000 in 1943.

Although Roosevelt's goals at first seemed fantastic, the aircraft industry by the end of the war had produced some 300,000 aircraft—about the same number as Germany, Britain, and Japan combined. It took an unprecedented and monumental effort to reach such totals. Manufacturers

## 14 aircraft industry

had to expand current plants, create new facilities and production processes, subcontract smaller parts out to other industries, and recruit qualified workers. Dozens of new aircraft plants were created in the United States, many of them in the SUNBELT states. Cooperation within the aircraft industry in the sharing of manpower, materials, new techniques, and technologies also contributed to the remarkable production totals.

Naturally, this infusion of money, coupled with greater emphasis on scientific research and development, accelerated the trend toward aviation prowess. Pressurized fuselages, computer-directed fire control systems for gun turrets, radar bombing, more powerful engines, and flush riveting all gave the United States, particularly its strategic bomber fleet, decided advantages over Axis adversaries. The huge Boeing B-29 Superfortress, which was deployed in 1944, was the largest bombardment aircraft of the war and could fly higher, faster, and farther than any other con-

temporary. Massed formations of B-29s literally burned Japan's economic infrastructure to the ground, and B-29s also were called upon to deliver the first two atomic bombs over HIROSHIMA AND NAGASAKI. The Americans also acquired sophisticated jet engine technology from Great Britain and flew their first jet fighter, the Bell XP-59, in 1943. The following year the Lockheed P-80 Shooting Star took to the skies and, while it missed combat operations during World War II, performed capable frontline service as a fighter bomber throughout the Korean War, 1950–53. In 1944 the U.S. ARMY AIR FORCES also fielded the Sikorsky R-4 Hoverfly, the world's first military helicopter, and quickly secured dominance in this field throughout the postwar period.

Though never matching the efficiency and productivity of HENRY J. KAISER in wartime SHIPBUILDING, Henry Ford conceived and carried out the creation of an enormous aircraft facility near Detroit in Willow Run, Michi-

One of the most important World War II contractors was the Boeing Company of Seattle, Washington. In this photograph two assembly-line workers are seen completing the fuselage framework of a B-17 Flying Fortress bomber. (*Library of Congress*)

gan, that utilized the assembly line process. After early difficulties, “the Run” produced 500 bombers a month and at peak efficiency in 1944 could turn out a new B-24 Liberator bomber every 63 minutes. The standardization of parts in the industry allowed for certain components to be manufactured at smaller facilities and shipped for final assembly elsewhere. The switch to the assembly line process in aircraft plants not only increased efficiency and productivity but also allowed the use of unskilled and semi-skilled workers.

As the value of industry production soared to \$5.8 billion in 1942, \$12.5 billion in 1943, and the wartime peak of \$16 billion in 1944, employment within the aircraft industry burgeoned from some 50,000 in 1939 to over 2 million by 1943. AFRICAN AMERICANS comprised more than 6 percent of employees, while the employment of women, found to be highly efficient and more dexterous than men while welding in small spaces, increased to a peak of nearly one-half million. (Despite the enduring image of ROSIE THE RIVETER, relatively few women were trained as riveters or other higher-skilled jobs.) Facility managers counteracted low morale and high turnover among assembly-line workers with the use of on-site nurseries, music, and lunchtime entertainment as well as appeals to patriotism.

Government planning for RECONVERSION helped cushion the impact of the war’s end on aviation as it did for other industries in the early postwar period. The aircraft industry—which had effectively demonstrated the importance of air power, established the ease of air transport for passengers and cargo, and continued to create such new technologies as jet engines and helicopters—would continue to grow in size and importance in the postwar era.

## air power

WORLD WAR II was the first conflict in history to see the daily use of strategic and tactical air power. Air power thus played a major role in the war, not only in support of ground operations but also in naval combat in the WORLD WAR II PACIFIC THEATER.

Japanese air forces, divided into army and naval forces, contained the most sophisticated aircraft in the world by

1941, and scored triumphs against the United States at PEARL HARBOR in December 1941, and during campaigns in the Pacific early in 1942. But Japan suffered major defeats at the hands of the U.S. NAVY at the BATTLE OF THE CORAL SEA in May 1942 and at the BATTLE OF MIDWAY in June 1942—encounters that underscored the new importance of air power in naval warfare, for the surface fleets never came in contact. The BATTLE OF THE PHILIPPINE SEA in 1944 brought the effective end of Japanese air power. The Japanese air forces, and Japan’s smaller aircraft industry, were overwhelmed by more numerous and mobile American air forces to the point that air defenses of the home islands were practically nonexistent when the American BOMBING campaign began in mid-1944.

In the EUROPEAN THEATER, the Germans demonstrated air power in a ground support role in Poland in September 1939. The German Luftwaffe quickly destroyed the Polish air force, enabling attacks at will on depots, factories, transportation centers, and enemy forces. This same pattern, using aircraft as “flying artillery,” was used in every German BLITZKRIEG campaign in Europe between 1940 and mid-1942. However, the BATTLE OF BRITAIN in 1940 and subsequent military operations severely strained the Luftwaffe, as did demands for home air defense after Allied bombings campaigns began in 1942. Although the Anglo-American strategic air campaigns encountered heavy Luftwaffe resistance, this threat ended by early 1944, as did Germany’s ability to provide air support for German troops in the field.

The Allies developed sophisticated tactical air forces. As they prepared for the INVASION OF NORMANDY, the British Royal Air Force and the U.S. ARMY AIR FORCES gained air superiority over Europe and destroyed transportation and communications networks vital to counter-attacking enemy forces. When the Normandy invasion took place, Anglo-American air power was overwhelming, numbering approximately 12,000 aircraft, compared to 300 Luftwaffe aircraft. On D day, the Allies flew 15,000 sorties, the Luftwaffe only 100. For the remainder of the war, Allied air forces controlled European skies.

The Anglo-American strategic air campaigns against Germany and Japan were controversial and involved questions of effectiveness versus costs in money, material, and manpower, as well as the military value and morality of bombing urban areas. The British began the strategic bombing of Germany in 1940, but discovered that daylight long-range missions were costly and bombing inaccurate, prompting the start of night area attacks on nonindustrial targets. When the U.S. Eighth Army Air Force arrived in Britain in 1942, its leaders emphasized daylight precision bombing in the erroneous belief that B-17 Flying Fortresses, using the Norden bombsight, could obtain significant results with acceptable losses. They asserted

## 16 Amalgamated Clothing Workers of America

bombers could reach and destroy “choke points” in the German economy that would shut down the enemy war effort. Operations against ball bearing plants in 1943 had little impact, but the discovery that petroleum was the vital “choke point” quickly brought Germany to grief. In addition, the early 1944 advent of long-range escort fighters such as the U.S. P-51 Mustang and the P-47 Thunderbolt assured the survival of the bomber and made the Allied Combined Bomber Offensive more lethal. Although it failed to destroy enemy morale, strategic bombing reduced war production, snarled TRANSPORTATION and communications, and diverted significant resources from the fronts to home defense. Allied raids killed an estimated 600,000 German civilians.

In the Pacific, American raids on Japan, using the B-29 Superfortress, had little effect until bases were established in the MARIANA ISLANDS, and carpet bombing with napalm was substituted for high-level bombing in March 1945. Between March and August 1945, an estimated 60 percent of Japan’s urban areas were burned out, killing an estimated 500,000 people. In August 1945, American aircraft used the new ATOMIC BOMB on HIROSHIMA AND NAGASAKI and World War II came to an end.

A country’s capacity for developing air power depended on the availability of a large industrial base, scientific and technical knowledge, a skilled workforce, secure training and base areas, and ample raw materials and fuel. Between 1939 and 1945, the United States, with its productive AIRCRAFT INDUSTRY, produced some 300,000 aircraft. During the same period, the Soviet Union produced 157,000 aircraft; the United Kingdom, 131,000; Germany, 120,000; and Japan, 77,000. Aircraft losses were greatest for Germany (95,000), followed by the Soviet Union, the United States (59,000), Japan (49,000), and Great Britain (49,000).

### Amalgamated Clothing Workers of America (ACW)

The Amalgamated Clothing Workers of America (ACW) was founded on December 25, 1914, as an outgrowth of another labor union, the United Garment Workers (UGW). The latter was unable to adequately represent the influx of immigrant labor in a series of devastating STRIKES, 1910–14, so a faction arose under SIDNEY HILLMAN, a Lithuanian Jew, which declared its independence from

the older organization. The ACW was not recognized by the AMERICAN FEDERATION OF LABOR (AFL), but Hillman and his cohorts remained fixed in their determination to organize the entire men’s clothing industry. His dogged pursuit of this goal seemed far-fetched initially, but the aggressive Hillman proved himself an exceptionally talented labor organizer. In 1916 he secured a 44-hour workweek for the rank and file and agitated strongly against the exploitive sweatshop conditions usually encountered by immigrant workers. He also managed a rapprochement with the AFL and eventually joined their ranks in 1933. However, the clothing industry was devastated by the onset of the GREAT DEPRESSION in 1929 and the ACW was hard-pressed to keep its members fed, clothed, and housed over the next four years. Hillman managed to assist by mitigating wage and benefit cuts for those workers still employed, while agitating for the election of FRANKLIN D. ROOSEVELT. Roosevelt’s victory in the ELECTION OF 1932 placed a pro-labor administration in Washington, D.C., and the ACW proved to be at the cutting edge of labor reforms such as unemployment insurance, cooperative housing, employer-provided health and life insurance programs, and union daycare centers. Hillman’s militant activism grated upon the more conservative and trade-oriented AFL leaders, however, so in 1935 he joined UNITED MINE WORKERS OF AMERICA (UMW) leader JOHN L. LEWIS in founding the industrial-based CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO). The AFL eventually expelled the ACW in 1938 for its strident militancy. Hillman’s success as an organizer swelled the ranks of the ACW, which reached 260,000 members by 1939. Demographically, the union remained dominated by Jewish, Italian, and other ethnic groups from southern and eastern Europe. By the time Hillman died in 1946, he had made the ACW into one of the nation’s most effective labor unions, with an extensively broad social welfare program that many other unions sought to emulate.

### America First Committee

The America First Committee was the most prominent organization opposing American intervention in Europe and the Pacific and challenging the FOREIGN POLICY of President FRANKLIN D. ROOSEVELT during the 15 months leading up to PEARL HARBOR and the U.S. entry into

WORLD WAR II. It was the brainchild of R. Douglas Stuart, Jr., a Yale Law School student, who during the summer of 1940 enlisted the support of a number of businessmen and politicians, primarily from the Midwest, where ISOLATIONISTS were especially numerous.

The formation of the America First Committee was announced in Chicago on September 4, 1940, following the announcement of the DESTROYERS-FOR-BASES DEAL with England. General Robert E. Wood, the chairman of the board of Sears, Roebuck, & Company, became the national chairman; Stuart became the national director; and a five-member executive committee, mostly of midwestern businessmen, was established. A larger national committee included such prominent individuals as Alice Roosevelt Longworth, the daughter of Theodore Roosevelt; George N. Peek, the former head of the AGRICULTURAL ADJUSTMENT ADMINISTRATION; Eddie Rickenbacker, the noted aviator and World War I flying ace; and Lillian Gish, the famous silent film actress. Henry Ford served on the national committee for several months, but was dropped by America First because of his suspected ANTI-SEMITISM. The celebrated aviator Charles A. Lindbergh became a national committee member in April 1941, after declining an offer to replace Wood as chairman.

Many prominent Americans in business, labor, and politics spoke at America First rallies and lent their names to committee activities. The list included HERBERT C. HOOVER, BURTON K. WHEELER, Gerald P. Nye (chairman of the NYE COMMITTEE), ROBERT M. LA FOLLETTE, JR., NORMAN THOMAS, HUGH S. JOHNSON, and JOHN L. LEWIS. While most America First members and their allies were affiliated with the REPUBLICAN PARTY, a broad range of political ideologies were represented, including neofascists, members of the DEMOCRATIC PARTY, SOCIALISTS, and even a few COMMUNISTS. At its peak, the America First Committee had a membership of between 800,000 and 850,000, with the greatest concentration of members in the Midwest—especially within a 300-mile radius of Chicago. It was weakest in the interventionist SOUTH.

To the embarrassment of many America First leaders, the committee, its local chapters, and its activities, attracted some neo-Nazi elements, as well as followers of the vitriolic radio priest FATHER CHARLES E. COUGHLIN. Opponents of America First, including the Roosevelt administration, accused the committee of being a “Nazi transmission belt.” Roosevelt himself authorized wiretaps and FEDERAL BUREAU OF INVESTIGATION probes and urged his attorney general to investigate the America First Committee. While most members of America First were loyal, patriotic Americans who hated German tyranny, doubts lingered, especially after Lindbergh gave an inflammatory and, some believed, anti-Semitic speech under committee auspices at Des Moines, Iowa, in September 1941.

The America First Committee believed that it was more important for the United States to stay out of the European conflict than to assist a British victory over the AXIS powers. In early 1941, the America First Committee fought vigorously against LEND-LEASE aid to Great Britain. After Roosevelt signed the Lend-Lease bill, the America First Committee opposed naval escorts for shipping CONVOYS across the Atlantic Ocean, fearing that the sinking of American vessels would draw the nation into war. The committee also objected to sending U.S. military draftees outside the Western Hemisphere. Unsuccessful in those efforts, the America First Committee also failed to prevent the repeal of the provisions of the NEUTRALITY ACTS forbidding the arming of American vessels and allowing them access to belligerent ports.

The America First Committee nonetheless continued its efforts up until the attack on Pearl Harbor on December 7, 1941. Over the next month, the America First Committee ceased all noninterventionist activity, postponing rallies and halting the distribution of literature, and the national committee voted to dissolve the organization. By April 1942, the America First Committee had ceased to exist.

### American Civil Liberties Union (ACLU)

In 1920, members of the National Civil Liberties Bureau, which had defended conscientious objectors and other dissidents in World War I, founded the American Civil Liberties Union. For most of the 1920s, the ACLU was a small group of lawyers and other activists that fought primarily for freedom of political speech and occasionally for academic freedom, as in the famous Scopes trial of 1925. In 1929, the ACLU began contesting limits on other types of expression, such as CENSORSHIP of books and MOVIES.

Throughout the 1930s and 1940s, the ACLU's conception of CIVIL LIBERTIES became even broader and went beyond first amendment rights. The organization became especially active in cases involving issues of race and minority rights. In 1932, it issued a report entitled “Black Justice,” which detailed the extent of institutional racism in America, and it took part in *Powell v. Alabama*, a U.S. SUPREME COURT case that arose out of the SCOTTSBORO BOYS incident. In 1934, the ACLU lobbied for the INDIAN REORGANIZATION ACT. During WORLD WAR II, it opposed the RELOCATION OF JAPANESE AMERICANS on

## 18 American Federation of Labor

the basis of race and argued for the desegregation of the armed forces.

At the same time, the ACLU continued to defend political dissenters in the 1930s and 1940s. For example, it fought the loyalty oaths required of teachers by law in more than 20 states. The organization opposed the Alien Registration Act (known as the SMITH ACT) of 1940, which required all resident aliens to be fingerprinted and made it illegal to advocate violent overthrow of the U.S. GOVERNMENT. It also defended American Nazi groups' right to rally. Though it did not oppose the SELECTIVE SERVICE system, it did fight for the rights of CONSCIENTIOUS OBJECTORS in various court cases.

In other instances, the positions adopted by the ACLU sometimes seemed to contradict its professed ideals. In 1940, for example, the ACLU declared that persons belonging to "political organizations that support totalitarian governments" could no longer serve on any of its committees, a stipulation many considered analogous to the loyalty oaths previously denounced by the organization. And while ACLU lawyers represented Japanese Americans who claimed that internment during World War II was based on their race, and therefore illegal, they did not, as a group, challenge the constitutionality of EXECUTIVE ORDER 9066.

Despite being criticized by some for being too radical and by others for being too timid, the ACLU was an important organization in the 1930s and 1940s. Most significant were its efforts to prevent a repeat of the widespread abuses of civil liberties that had occurred during World War I and its willingness to broach the subject of racial injustice at a time when few Americans would.

—Pamela J. Lauer

### American Federation of Labor (AFL)

The American Federation of Labor (AFL), had long been the preeminent LABOR organization by the onset of the GREAT DEPRESSION. Founded in 1886 and led until his death in 1924 by Samuel Gompers, the AFL was an association of craft unions, including carpenters, clothing and garment workers, electricians, machinists, meat cutters, and teamsters, along with coal miners.

The AFL shunned radical politics in favor of conservative unionism, which emphasized volunteerism without GOVERNMENT interference in labor-management relations, and focused on the bread and butter goals of wages, hours, and working conditions of union members. Its membership primarily comprised native-born, "old-stock" skilled

craftsmen, rather than the "new-immigrant" (southern and eastern European) and African American unskilled workers who toiled in mass production industries such as automobiles, coal, and steel. In the heavy industries where the AFL had a presence, they impeded organizing, prevented strikes, and often ignored workers. The 1920s were not good years for organized labor, as prosperity, the hostility of BUSINESS toward workers, government sympathy toward employers, and the rigidity of the AFL's leadership, helped thin the ranks to less than 3 million members on the eve of the Great Depression.

Important AFL leaders, including its president, William Green, and JOHN L. LEWIS, had backed HERBERT C. HOOVER for president in 1928 and 1932. However, the election of FRANKLIN D. ROOSEVELT in 1932, and then such NEW DEAL legislation as the NATIONAL INDUSTRIAL RECOVERY ACT and the NATIONAL LABOR RELATIONS ACT, shifted labor support to the DEMOCRATIC PARTY. In the ELECTION OF 1936, AFL unions contributed significant amounts of money to Roosevelt and the Democrats and union members voted overwhelmingly Democratic.

By the mid-1930s, however, conflict was growing within the labor movement between the craft unionists, who wanted workers organized according to skill, and leaders like Lewis and SIDNEY HILLMAN, who believed in "industrial unionism"—gathering *all* workers in an industry into a single union. The tensions within the AFL reached a boiling point at the federation's convention in October 1935. There, Lewis appealed to the delegates that they had a duty to support the struggling unions in the mass production industries because the labor movement, he said, was founded on the principle that "the strong shall help the weak." A resolution demanding industrial unionism in the AFL was decisively defeated, and Lewis got into a fistfight with "Big Bill" Huteson, the head of the carpenters' union.

On November 4, 1935, Lewis, Hillman, and several other union leaders met and formed the Committee for Industrial Organization, originally intended to be a branch within the AFL. The AFL leadership, however, opposed the organizational efforts by the committee in the mass production industries, and suspended 10 dissident unions in 1937. A year later, in November 1938, Lewis, Hillman, and the other suspended unionists broke away from the AFL, and formed a separate labor federation, the CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO).

Hostilities between the two groups persisted as the AFL began a "counterreformation," claiming to be the honest union, rather than the "radical-infested" CIO—points they made by testifying before the House Un-American Activities Committee and urging boycotts of CIO-made products. Between 1937 and 1945, the AFL claimed nearly 4 million new members, more than the CIO over the same

period, and enjoyed remarkable growth in nonmanufacturing industries such as transportation, communication, construction, hotel, restaurant, and retail, and public service workers.

The onset of WORLD WAR II did not end the hostility between the two labor federations, despite efforts by some union leaders and Democratic Party politicians. Conflict occurred in defense industries such as aircraft and electrical plants, and the AFL was accused of red-baiting, corruption, and being cozy with business. Competition between the AFL and CIO continued after the war, until the two organizations came to a merger agreement as the AFL-CIO in 1955.

### American Liberty League

In August 1934, a number of conservative Democrats joined with important businessmen to form the American Liberty League for the purpose of opposing President FRANKLIN D. ROOSEVELT and the NEW DEAL. The Liberty League argued that the New Deal was an unconstitutional effort to enlarge GOVERNMENT and regulate BUSINESS and that it would impede recovery from the GREAT DEPRESSION and harm the nation's ECONOMY and political system. A significant voice of CONSERVATISM in the 1930s, this well-financed organization used speeches and publications to promote its message, but it never gained many followers and disbanded in 1940.

The league's leadership came largely from wealthy businessmen and members of the DEMOCRATIC PARTY who were unhappy with Roosevelt and the New Deal. The Du Pont family provided about one-third of the league's funding, but such major businessmen as Alfred Sloan of General Motors, Edward F. Hutton of General Foods, Sewell L. Avery of Montgomery Ward, and Nathan Miller of U.S. Steel contributed as well. Important conservative Democrats, including 1928 Democratic presidential candidate Al Smith, former Democratic Party chairman John J. Raskob, and 1924 Democratic presidential candidate John W. Davis, also joined the League and played important roles.

Though claiming to be nonpartisan and nonpolitical, the league spoke out against Roosevelt, New Deal programs and many of the people Roosevelt brought to government. Jouett Shouse, a former chairman of the Democratic Party

Executive Committee who headed the Liberty League, explained that the league's goal was "to defend and uphold the Constitution, . . . [to] teach the duty of government to encourage and protect individual and group initiative and enterprise, to foster the right to work, earn, save, and acquire property and to preserve the ownership and lawful use of property when acquired." In league speeches and publications Roosevelt was characterized as a tyrant and the New Deal was characterized as fascistic, socialistic, or communistic. (Roosevelt said that the league seemed to him like a group formed to support just two or three of the Ten Commandments.)

In 1936, the Liberty League focused on unseating Roosevelt in that year's presidential election. At a league dinner in Washington, D.C., on January 25, 1936, Al Smith gave the keynote address, in which he accused the New Deal of causing class warfare and betraying both the Democratic platform of 1932 and the United States Constitution. He said that "there can be only one capital, Washington or Moscow." The Roosevelt administration turned this speech on the league, arguing that it was merely representing big business and their selfish interests.

In the ELECTION OF 1936, the league supported REPUBLICAN PARTY presidential candidate ALFRED M. LONDON, who saw its endorsement as a liability. The league's membership (at its peak, reportedly 125,000) fell off following the landslide reelection of Roosevelt in 1936, and the league stopped its public activities and disbanded within a few years.

### amphibious warfare

During WORLD WAR II, amphibious warfare, the practice of invading enemy-held territory from the sea by transporting troops, along with armor, artillery, and all material to sustain short-term operations, and then securing a beachhead, became a new operational art. Requiring the full integration of air, land, and sea forces, it also depended upon a degree of planning, organization, technical and operational competence, and flexibility of command and control rarely seen prior to 1942. Although methods were initially crude, by 1945 the art of amphibious warfare was brought to near perfection, especially by the U.S. MARINES and the U.S. ARMY. Although Japan and Germany carried out limited amphibious assaults between 1937 and 1942, it was the United States that first created a specific amphibious warfare doctrine, with specialized troops, landing craft, weapons, and equipment.

The amphibious assault of Normandy beaches was a major part of the Allies' Operation Overlord. Seen here are men of the veteran U.S. First Infantry Division going ashore under enemy fire. (*Library of Congress*)

The U.S. Marine Corps began amphibious warfare experiments in the 1930s and subsequently tailored its weapons and units to fit the naval ships then under construction. In addition, the marines experimented with landing craft, based on the American Higgins boat, and with amphibious tracked vehicles and other larger types of craft developed in Britain. The marines also developed the concept of combat loading, ship-to-shore artillery support, as well as close air support. All six U.S. Marine divisions during World War II were trained in amphibious assault tactics, and marine instructors trained U.S. Army divisions that were used in the landings of the NORTH AFRICAN CAMPAIGN, at SICILY, in the ITALIAN CAMPAIGN, in the INVASION OF NORMANDY, and at the Aleutians, New Guinea, the PHILIPPINES, and OKINAWA.

The drive of the U.S. NAVY and Marine Corps across the central Pacific against Japan in the WORLD WAR II PACIFIC THEATER started with the assault on TARAWA in the Gilbert Islands in November 1943, which demonstrated the validity of amphibious warfare. Although marine forces encountered fierce opposition and heavy losses, amphibious assaults were subsequently carried out in the Marshall Islands (February 1944), in the MARIANA ISLANDS (June–July 1944), on Peleliu (September 1944), at IWO JIMA (February 1945), and at Okinawa (April 1945).

General Douglas MacArthur, commanding U.S. Army forces in the Southwest Pacific theater, became equally

expert in amphibious operations and performed a series of leapfrog assaults in New Guinea and the Philippines between 1942 and 1945. Indeed, U.S. Army forces in the Pacific undertook more amphibious assaults than the Marine Corps, and between October 1944 and August 1945 alone, MacArthur conducted 52 amphibious landings against Japanese-held areas.

In the EUROPEAN THEATER, the British carried out amphibious operations at Dieppe in August 1942, and larger, more successful landings with U.S. Army forces in North Africa; at Sicily, Salerno, and Anzio in Italy; in southern France; and at Normandy. Amphibious operations became central to British and American strategic conduct of the war. The amphibious assault was shown at its most complex in the Normandy invasion on June 6, 1944, and the January 1945 invasion of Luzon Island in the Philippines, which were the largest operations of their kind in history.

Landing forces were usually divided into assault troops, reinforcing units, and occupation forces. Following a prelanding air and naval bombardment, landing craft carrying the assault formations were guided toward the beaches. Landing craft were loaded with supplies and equipment in such a way that they could be unloaded in the order they were needed ashore. The assault took place in waves using specially designed landing craft, each carrying a complete military unit. Each wave was timed to reach shore at a particular time to prevent an excessive buildup of forces on the beach and to assure landing in the correct tactical order. Landing forces were most vulnerable when hitting the beach, and it was vital to have the correct mix of air and naval gunfire available at H-Hour, the moment of landing on D day, to assure that troops would not be pushed back into the sea. Complications necessitated great command flexibility. Once troops had secured a beachhead, reinforcing units arrived with heavier equipment and weapons. When the beachhead was secure, occupation forces, usually comprised of logistical and construction personnel, landed to establish a base for further operations.

### Anglo-American relations

The era of WORLD WAR II brought the development of a uniquely close diplomatic relationship between the United States and Great Britain. Although the United States was

absorbed by the GREAT DEPRESSION in the early 1930s and then sought insulation from global affairs with the NEUTRALITY ACTS of the mid-1930s, Anglo-American collaboration in World War II brought the two nations together in what came to be known as the “special relationship.”

During the Great Depression and the resulting domestic turmoil, the United States largely withdrew from leadership in international affairs. President HERBERT C. HOOVER did attempt to maintain some American involvement in global affairs, cooperating for example with Great Britain and Japan to limit naval building at the LONDON NAVAL CONFERENCE of 1930. But other actions, such as the protectionist HAWLEY-SMOOT TARIFF ACT of 1930, weak American responses to the Japanese invasion of MANCHURIA and the Italian invasion of ETHIOPIA, and the lack of American cooperation at the LONDON ECONOMIC CONFERENCE of 1933, during the HOOVER PRESIDENCY and the first term of FRANKLIN D. ROOSEVELT, reflected the U.S. reluctance to provide significant international leadership. The Neutrality Acts then confirmed the American effort to avoid entanglements in the events that ultimately led to World War II, and Roosevelt was essentially a bystander as British prime minister Neville Chamberlain concluded the MUNICH CONFERENCE with Nazi Germany. Such American policy, prompted in part by significant anti-British sentiment within sectors of the American public, contributed to an atmosphere of some suspicion between the two nations.

By the end of the 1930s, however, Roosevelt grew increasingly disturbed about events in Europe and, especially after the outbreak of war in 1939, sought to establish a closer relationship with Great Britain. In 1939, the president succeeded in ending the arms embargo of the Neutrality Acts and to have CASH-AND-CARRY apply to war goods, thus allowing belligerent nations (Britain, in particular) to obtain war supplies if they were paid for in cash and were not transported in American ships. Roosevelt further illustrated his belief that the United States and Great Britain had developed concurrent interests in FOREIGN POLICY by establishing a close personal relationship with new British prime minister Winston Churchill. Continued collaboration between the two world leaders would later play a crucial role in the course of Allied action in World War II.

American popular opinion began to shift significantly in favor of aiding England in wake of the German BLITZKRIEG offensive of spring 1940 and the ongoing BATTLE OF BRITAIN. Such measures as the DESTROYERS-FOR-BASES DEAL of 1940 and the LEND-LEASE Act of 1941 authorized significant American assistance to the British in the war against Germany. Discussions began in early 1941 to make strategic plans in preparation for the possibility of American entrance into World War II, a cooperation that would continue throughout the course of the war. Roosevelt and

Churchill met in person for the first time in August 1941 and produced the ATLANTIC CHARTER, which outlined Allied war principles and aims.

After PEARL HARBOR and the American entry into the war, the Soviet Union joined the United States and Great Britain in endorsing the terms of the Atlantic Charter, creating the GRAND ALLIANCE. Because the United States and Great Britain shared democratic views and values as well as mutual concerns and often similar visions of the postwar world, Anglo-American relations were always closer than SOVIET-AMERICAN RELATIONS. Significantly, the British were involved in the ATOMIC BOMB project and discussions about the bomb's potential use, while the Soviets were not notified of the bomb's existence until the POTSDAM CONFERENCE in July 1945—and even then cryptically. Shared interests between the United States and Great Britain often placed them in direct opposition with their Soviet allies. For much of the war, Roosevelt acquiesced in Churchill's desire to delay the opening of a SECOND FRONT in western Europe, much to the dismay of Soviet premier Joseph Stalin. These mutual interests also extended to preparations for the postwar world as both the British and Americans were concerned about Soviet efforts to create a sphere of influence in eastern Europe.

But there were differences as well, and some tensions in Anglo-American relations during the war. The British did not share the anticolonial views of the United States, and resisted American pressure to grant its colonial possessions—India in particular—independence. American strategists were much more eager than the British to open the second front as soon as possible. And as it became more apparent that Great Britain would no longer be able to maintain its previous stature in international affairs and that the United States and the Soviet Union would be the dominant postwar powers, Soviet-American relations became increasingly important in Roosevelt's priorities. At the TEHERAN CONFERENCE of late 1943, Roosevelt sided with Stalin in insisting on launching the Normandy invasion to open the second front in the spring of 1944.

Despite such differences and disagreements, and despite the shifts in global power, Anglo-American relations remained close. In the postwar world, Anglo-American relations would remain friendly as both nations would find themselves opposing their erstwhile Soviet ally in the developing cold war.

### anticommunism

The period immediately following World War I witnessed an upsurge in activities and membership of the American Communist Party, largely inspired by the Russian Revolution. Militant workers triggered a so-called “strike wave” that BUSINESS and other conservative interest groups believed was instigated by the new Soviet Communist party in Moscow. In the great red scare of 1919–20, the federal government also took an active role in arresting and deporting high-level communist leaders in a campaign orchestrated by Attorney General J. Mitchell Palmer. Palmer created the Bureau of Investigation (a precursor to the FEDERAL BUREAU OF INVESTIGATION) and placed its General Intelligence Division in the hands of a youthful agent, J. Edgar Hoover. High-ranking labor leaders like Samuel Gompers of the trade-oriented AMERICAN FEDERATION OF LABOR (AFL) also worked against COMMUNISTS within his organization and drove them out. Ultimately, Hoover and Palmer were responsible for the arrest and deportation of 6,000 Communists and suspected sympathizers by the end of the decade, when the communist threat had evidently subsided. The nation’s anticommunist animus nonetheless remained strong.

The American Communist Party rebounded in labor circles following the onset of the GREAT DEPRESSION in 1929 when some workers, perplexed by capitalism’s apparent collapse, turned to that ideology in desperation. The party’s resurgence increased after 1935, when the Soviet sympathizers were ordered by Joseph Stalin to stop advocating class revolution and to form associations within labor and liberal circles throughout the western democracies. American Communists consequently began agitating for helping the chronic unemployed, organizing workers, ending segregation, supporting NEW DEAL legislation, and forming a POPULAR FRONT against fascism around the world. They enjoyed their greatest success infiltrating the ranks of the new CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO), which was bitterly attacked by Gompers and other labor leaders for their perceived allegiance to Moscow.

In response to these developments, such conservative organizations as the American Legion and the U.S. Chamber of Commerce joined the anticommunist effort. By the late 1930s the REPUBLICAN PARTY increasingly alleged that the New Deal and the DEMOCRATIC PARTY had communist ties and sympathies, allegations that mounted in the 1940s. The Catholic Church also joined the crusade after 1938, alarmed by the treatment of the church and its clergy in the leftist-dominated SPANISH CIVIL WAR. The Vatican strongly denounced what it viewed as assaults upon organized religion by Communists, and American Catholics responded with organizations, such as the Association of Catholic Trade Unionists (ACTU), that urged

workers and trade unions to expel Communist members. Anticommunism in America received another boost in September 1939 following the NAZI-SOVIET PACT, which alienated American liberals and SOCIALISTS from the Communist Party. They joined with traditional anticommunist factions in business and religion and joined in denouncing the American Communist Party for placing Soviet aims over security interests of the United States. The Roosevelt administration also responded by arresting Communist Party leader Earl Browder on a passport charge, while the CIO began purging Communists from high office within its ranks.

The rising tide of anticommunism abated somewhat following the Nazi invasion of Russia in June 1941 and America’s entry into WORLD WAR II six months later. The United States was now part of the GRAND ALLIANCE with the Soviet Union against the Axis powers. The American Communist Party, previously isolationist, did much to ameliorate prior suspicions about its loyalty by throwing itself vigorously behind the war effort. But the anticommunist movement, though temporarily muted, emerged in the postwar period stronger than ever and drew up a variety of corporate, patriotic, political, labor, and church alliances that first coalesced in the late 1930s.

—John C. Fredriksen

### antilynching legislation

From Reconstruction down through the 1930s, white racial antipathy toward AFRICAN AMERICANS was often manifested in the form of mob violence and lynching, especially in the SOUTH, where the majority of lynchings occurred. Existing Jim Crow laws had basically stripped blacks of voting and other CIVIL RIGHTS, and white authorities typically felt no compulsion or obligation to arrest and prosecute those committing the murders. Not surprisingly, the strongest and most vocal opposition to racially induced mob violence came from the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP), which in 1919 sponsored the first national conference on lynching and published the noted tract *Thirty Years of Lynching in the United States, 1889–1918*, with annual supplements. The first concerted political action against lynching was introduced in 1922 by Republican congressman Leonidas Dyer of Missouri, who had worked closely with NAACP president James Weldon Johnson to fine and imprison local officials who failed to prosecute those responsible. The

Dyer Bill passed the House of Representatives but died in the Senate under the threat of a southern filibuster.

The onset of the NEW DEAL stimulated a renewed drive to pass antilynching legislation by CONGRESS. In 1933 the Commission on Interracial Cooperation published a report entitled *The Tragedy of Lynching*, which dwelt upon the 28 murders that had been committed that year. The following year NAACP president WALTER WHITE prevailed upon Democratic senator Joseph Costigan of Colorado to introduce legislation that would have declared lynching a federal crime if state and local authorities failed to act properly within 30 days. However, owing to entrenched opposition from southern senators, the bill never made it out of committee. Similar efforts attempted in 1935, 1936, and 1937 failed to muster the votes necessary to end a filibuster, despite vocal support for the bill mounted by a varied coalition of minorities, LABOR, women, churches, and civil liberties groups. In 1938 Costigan, backed by a fellow Democrat, Senator ROBERT F. WAGNER of New York, reintroduced antilynching legislation but was stymied by an intense obstructionist campaign by southerners in the Senate. The southern Democrats found allies in the conservative Republicans who, while generally opposed to lynching, were worried about further federal intrusion in state prerogatives.

Although President FRANKLIN D. ROOSEVELT and his wife, ELEANOR ROOSEVELT, went on record opposing lynching, neither took an active role in marshaling the political support necessary to outlaw it. The president, in particular, feared offending southern Democrats who controlled Congress through committee chairmanships and upon whom he depended to pass New Deal legislation. Eleanor Roosevelt, for her part, restricted her activities to consulting with the NAACP in the White House and sounding out possible legislative strategies. Not until 1968 did Congress formally enact federal laws outlawing lynching.

**Further reading:** Jonathan Markovitz, *Legacies of Lynching: Racial Violence and Memory* (Minneapolis: University of Minnesota Press, 2004); Robert L. Zangrando, *The NAACP Crusade against Lynching, 1909–1950* (Philadelphia: Temple University Press, 1980).

—John C. Fredriksen

### antimonopoly

The conviction that economic concentration harmed the economy and gave big BUSINESS excessive political power was an important part of 20th-century LIBERALISM going back to the Progressive Era and especially to the ideas of Louis Brandeis. But while Brandeis (a SUPREME COURT justice in the 1930s) and his views continued to have significant influence among liberals, antimonopoly (or antitrust)

policy did not figure prominently in NEW DEAL reform and recovery programs until the mid- and late 1930s. Efforts to reduce the size and power of the corporate giants then lost momentum during WORLD WAR II.

The most important development in antimonopoly policy in the HOOVER PRESIDENCY involved LABOR rather than business. The 1932 NORRIS–LA GUARDIA ACT, sponsored by Republican senator GEORGE NORRIS of Nebraska and Republican congressman FIORELLO LA GUARDIA of New York, prohibited the use of federal court injunctions under the antitrust laws to enforce “yellow dog” employment contracts forbidding workers to join unions. President HERBERT C. HOOVER, an opponent of monopoly and of suspending or easing antitrust laws for business trade associations, reluctantly signed the legislation.

With the election of FRANKLIN D. ROOSEVELT to the presidency in 1932, antitrust advocates, including Brandeis disciple FELIX FRANKFURTER, a Harvard Law School professor, tried to influence New Deal policy in an antimonopoly direction. But the so-called FIRST NEW DEAL of 1933 sought instead to combat the GREAT DEPRESSION by cooperating with big business in national planning and controls. The NATIONAL INDUSTRIAL RECOVERY ACT (NIRA) of 1933 suspended antitrust laws so that the NATIONAL RECOVERY ADMINISTRATION (NRA) could develop “codes” of fair competition with cartel-like arrangements in industry. The NRA, however, failed to bring economic

In June 1934 President Franklin D. Roosevelt established the Securities and Exchange Commission. The measure was intended to protect consumers and the national economy, but as the cartoon shown here indicates, some felt the federal government's efforts to regulate trade were simply not powerful enough to destroy all the “roadblocks” facing small businesses. Cartoon by Philip Dorf (Private collection)

recovery and came under sharp criticism for breeding monopoly power from such progressive Republicans in CONGRESS as Gerald Nye and WILLIAM E. BORAH as well as from liberal Democrats. In 1935, the Supreme Court found the NRA unconstitutional in *SCHECHTER POULTRY CORPORATION V. UNITED STATES*.

Frankfurter and his protégés in the administration had more influence on the SECOND NEW DEAL of 1935. The PUBLIC UTILITY HOLDING COMPANY ACT sought to dismantle the giant corporations that dominated the electric power industry. New Deal TAXATION beginning with the REVENUE ACT OF 1935 aimed at taxing big business much more heavily than before, and the undistributed profits tax proposed in 1936 had an important antimonopoly dimension. The Robinson-Patman Act of 1936 prohibited manufacturers or wholesalers from giving special discounts to chain stores and other large purchasers, and the 1937 Miller-Tydings Act extended such “fair trade” protection to small retailers. Nonetheless, antitrust efforts remained secondary to other New Deal programs.

The RECESSION OF 1937–1938 then gave antimonopoly policy a far more central place in administration priorities. A number of New Dealers, including LEON HENDERSON, maintained that concentrated economic power allowed business to restrict production and fix prices higher than they should be, which in turn led to depressed sales, unemployment, and insufficient consumer spending power. Brandeisians had long held that the depression itself could be ascribed in large part to such monopoly power—and the recession, they said, provided more evidence yet. In April 1938, just after he had also announced an increase in federal spending, Roosevelt asked Congress to conduct an investigation into concentrations of economic power, and Congress created the TEMPORARY NATIONAL ECONOMIC COMMITTEE (TNEC).

The creation of the TNEC, with Henderson as its executive secretary, and the 1938 appointment of Thurman Arnold as assistant attorney general in charge of the Anti-trust Division of the Justice Department gave antimonopoly efforts impressive new momentum. The TNEC undertook a massive investigation of the American economy from 1938 to 1941, calling some 552 witnesses and publishing several dozen volumes of testimony and analysis. Arnold enlarged his division’s budget and staff fivefold, greatly stepped up its antitrust suits (some of them against labor unions), and had significant early successes. Yet the antimonopoly momentum was soon spent. When the TNEC issued its final report and recommendations in 1941, they attracted little attention, and Arnold encountered increasing resistance and difficulties.

World War II proved decisive in the ebbing of the new antimonopoly campaign, despite Arnold’s efforts and the concern of liberals in Washington about the grow-

ing size and power of big business in wartime economic MOBILIZATION. Wartime spending and the resulting prosperity confirmed the doctrine of KEYNESIANISM that government compensatory spending could fire the economy, and antitrust policy lost appeal as a way to enhance consumption and bring prosperity. Conservatives and businessmen won increasing influence in national policy. By mid-1942, antitrust efforts were essentially called off for the duration of the war when business and the military persuaded the administration that antitrust efforts distracted business and impaired mobilization efforts. In early 1943, Roosevelt appointed Arnold to the Washington, D.C., Court of Appeals. By the end of the war, antimonopoly efforts had lost much of their force and support.

Hawley, *The New Deal and the Problem of Monopoly: A Study in Economic Ambivalence* (Princeton, N.J.: Princeton University Press, 1966); David Lynch, *The Concentration of Economic Power* (New York: Columbia University Press, 1946).

## anti-Semitism

Anti-Semitism in America, present since the nation’s founding and particularly virulent in the 1920s, remained high and in some ways intensified during the GREAT DEPRESSION and WORLD WAR II. Manifested not just in attitudes about JEWS but also in actions ranging from name-calling to discrimination to acts of vandalism and sometimes violence, anti-Semitism rose during the war before declining by the end of the war.

PUBLIC OPINION POLLS in the 1929–45 era indicated that a significant minority of Americans accepted derogatory stereotypes of Jews. Such views held, for example, that Jews had too much political and economic power, and that they used this power to manipulate world and national events for their own benefit. The economic insecurities of the depression years sometimes led to scapegoating and reinforced anti-Semitic attitudes and behavior. Job discrimination, restrictive quotas in universities, and bans against Jews belonging to clubs or buying property in some developments remained common. Because President FRANKLIN D. ROOSEVELT included a number of Jewish officials in his NEW DEAL, anti-Semites called his administration the “Jew Deal.” After the United States entered into World War II, many Americans erroneously accused Jews of shirking military duty and charged them with profiteering from the war. From 1941 until 1944, Americans consistently reported to poll-

sters that they were more suspicious of Jewish Americans than they were of either Japanese Americans or German Americans.

Anti-Semitism was frequently expressed in harsh rhetorical attacks against Jews, including those by the Silver Shirt League, a nativist group, and by the American Bund, a Nazi-funded group that the U.S. GOVERNMENT would later target after America's entry into the war. A single anti-Jewish demonstration in Madison Square Garden in 1939 by the Bund drew more than 20,000 people and little counterprotest. Millions of Americans listened as well to the RADIO programs of FATHER CHARLES E. COUGHLIN, a Catholic priest who accused Jews of being Communist sympathizers and of subversively plotting to draw America into World War II. In his broadcasts, Coughlin subtly advocated violence against Jews. He openly supported the Christian Front, a native fascist group, whose members physically assaulted Jewish children in cities across America and, in one instance, conspired to poison dozens of Jews in Detroit and to assassinate members of CONGRESS. Hostility toward Jews also led to vandalizing Jewish businesses and to desecrating synagogues in some cities.

Most tragically, anti-Semitism contributed to the refusal of most Americans to support admitting the mostly Jewish refugees fleeing from Hitler's regime and the unfolding HOLOCAUST in Europe into the United States. A poll in 1938, in fact, indicated that 60 percent of Americans objected to the presence of Jews in America. The anti-Semitism of high-ranking officers in the State Department and in consulates abroad helped produce restrictive IMMIGRATION procedures designed to drastically limit Jewish immigration into the United States. Fear of provoking a powerful anti-Jewish backlash inhibited pro-immigration organizations that might otherwise have more forcefully called for members of the United States Congress to liberalize immigration quotas.

Jewish organizations, including the Anti-Defamation League, formed the General Jewish Council to counter the real and perceived threats posed by widespread anti-Semitism and to debunk anti-Semitic rumors and stereotypes. The U.S. government used other evidence gathered by the council to pursue and dismantle the American Bund. Not until 1944, when Americans felt confident that the nation would emerge victorious from World War II, did anti-Semitic sentiment in the United States subside. After the war, anti-Semitism declined sharply, in part because of a horrified reaction to the Holocaust and the attitudes that had produced it.

## Army, U.S.

The U.S. Army in WORLD WAR II was the largest ground force ever fielded in the nation's history and was vital to the Allied victory in both the EUROPEAN THEATER and the PACIFIC THEATER. In Europe, the army engaged AXIS forces beginning in November 1942 in the NORTH AFRICAN CAMPAIGN, and followed the victory there with successful operations in SICILY, the ITALIAN CAMPAIGN, the INVASION OF NORMANDY, and central Europe. In the Pacific theater, the army supported island-hopping advances of the U.S. NAVY and U.S. MARINES in the central Pacific and vanquished Japanese forces in the southwest Pacific and the PHILIPPINES.

The U.S. Army raised a force of more than 8.2 million men and women by March 1945, in both combat and support arms, including nearly 1.8 million personnel in the U.S. ARMY AIR FORCES. Under President FRANKLIN D. ROOSEVELT as commander in chief, the War Department, with headquarters at the newly constructed Pentagon, supervised the recruitment, training, deployment, and operations of the largest force in American history.

Roosevelt, like British prime minister Winston Churchill and Soviet leader Joseph Stalin, retained overall control of the nation's war effort, but he entrusted his civilian and military subordinates with greater responsibility for the conduct of affairs than did his contemporaries. Secretary of War HENRY L. STIMSON was responsible for the administration of the army from July 1940 until the end of the war. Stimson was assisted by Under Secretary of War Robert P. Patterson, who was primarily concerned with procurement; by Assistant Secretary of War John J. McCloy, who acted as Stimson's deputy; and by Assistant Secretary of War for Air Robert A. Lovett, who supervised air force administrative functions.

This civilian team controlled subordinate military elements consisting of three separate, coequal, and autonomous components following the reorganization of the War Department in March 1942. The first component was the U.S. Army Ground Forces under Lieutenant General Lesley J. McNair, whose command trained and developed ground combat branches including armor, infantry, airborne, and artillery. Once units were raised, trained, and equipped, they were shipped overseas to one of seven theaters where they became the theater commander's responsibility.

The second component, and eventually the largest, was the Services of Supply (later Army Services Forces), under Lieutenant General Brehon B. Somervell. This command bore responsibility for ground force logistics and procurement, and included the transportation and quartermaster corps, chemical warfare service, ordnance, medical, and signal corps, and the corps of engineers and military police. The third component was the army air forces under

## 26 Army Air Forces, U.S.

General HENRY H. “Hap” ARNOLD, which had its own organizations comparable to those of the ground forces.

The establishment of these commands left chief of staff GEORGE C. MARSHALL and the War Department General Staff free to plan and execute operations from the Operations and Plans Division at the Pentagon. Marshall controlled the theater commanders worldwide and coordinated U.S. Army operations with other military services represented on the Joint Chiefs of Staff, as well as British forces through the Combined Chiefs of Staff.

When the war started in 1939, the army consisted of 190,000 troops that were well trained and led, yet were understrength and lacking in modern equipment. The National Guard consisted of a mere 200,000 men. With the beginning of conscription, following passage of the SELECTIVE SERVICE Act in September 1940, the army ranks increased rapidly to approximately 1.4 million men by December 1941. During the war, 38.8 percent of personnel were volunteers and 61.2 percent were draftees. Although Marshall planned to raise 100 divisions, the army finally comprised 90 divisions. Approximately 73 percent served overseas, with an average duration of 33 months. At the beginning of the war, the army accepted AFRICAN AMERICANS only in limited numbers, usually in segregated noncombat units, but by 1945 the numbers and duties of black soldiers had expanded and some steps had been taken toward desegregation. Women served in the WOMEN’S ARMY CORPS (WAC).

The creation of the triangular infantry divisions in May 1940, each consisting of three regiments with three battalions and three companies, totaling 14,250 men, with supporting engineer, artillery, armor, service, and headquarters units, proved wise, as they were flexible in combat. The army was deployed in 11 field armies (First to Ninth, and 10th and 15th), containing 26 corps total. In addition to infantry divisions, the basic unit, the army created 16 heavy and light armored divisions, with 390 and 263 TANKS, respectively, and 60 nondivisional tank battalions, 326 artillery battalions, 400 antiaircraft batteries, and 86 tank destroyer battalions. In response to needs for specialized units, the army raised one mountain, five airborne, and two cavalry divisions. The army deployed 68 divisions to the European theater and 22 divisions to the Pacific theater.

It is generally accepted that the organization and administration of the army during World War II, both at home and abroad, was second to none. Critics do cite a faulty replacement system that tended to damage unit cohesion, and a lack of infantry replacements late in the war because of the draw of other branches of the military. American soldiers, however, were well trained, equipped, fed, and led. Their access to, and liberal use of, copious amounts of materiel, munitions, technically advanced weaponry, and firepower usually gave them a crucial edge.

Overall, army personnel performed well under fire and aggressively took the initiative to the enemy in diverse terrain, weather, and battle conditions. Casualties (combat and noncombat losses) in the U.S. Army and U.S. Army Air Forces numbered approximately 820,000, including 234,874 dead.

### Army Air Forces, U.S.

By the end of WORLD WAR II, the U.S. Army Air Forces comprised the largest and most powerful air armada ever created and dominated the skies in both the EUROPEAN THEATER and the PACIFIC THEATER. Vastly superior in size and technical sophistication to any other air force on either side of the conflict, the army air forces conducted decisive strategic BOMBING campaigns against both Nazi Germany and imperial Japan, significantly impairing Axis war production and morale. The army air forces also provided vital tactical close air support to American and Allied ground forces in every major campaign worldwide, especially after 1943, effectively denying enemy forces of their mobility and supplies.

In September 1939, the U.S. Army Air Corps was an administrative unit of the U.S. ARMY, under the command of Major General HENRY H. “Hap” ARNOLD. Many airmen, however, desired greater autonomy, believed that AIR POWER would play a major role in any future conflict, and were dissatisfied by a chain of command dominated by ground officers. Their agitation prompted the army to create a nearly autonomous and coequal U.S. Army Air Forces within the larger army in June 1941. As commander of the later Army Air Forces Headquarters, Arnold sat on the Joint Chiefs of Staff and directed subsequent air operations without formally reporting through the army chain of command to the chief of staff.

With a separate headquarters, training establishment, bases, meteorological and intelligence services, communications and transport system, and procurement and supply structure, the army air forces expanded at an extraordinary rate following the outbreak of the European War in 1939. In that year the army possessed 17 air bases in the continental United States, a figure that grew to 345 main bases, 116 smaller bases, and 322 auxiliary fields by 1943 alone, not counting additional thousands of bomber bases, airstrips, and other tactical fighter bases in the combat theaters abroad. Manpower grew from 20,000 men in June 1938 to nearly 1.8 million by March 1945, eventually com-

Formation of P-40s in a practice flight at the Army Air Forces advanced flying school (Library of Congress)

prising about one-fifth of the U.S. Army's total strength. Barred from the army air forces at the beginning of the war, African Americans subsequently served in limited numbers as pilots and crewmembers, most notably in the 99th Pursuit Squadron of the Tuskegee Airmen. In addition to those in uniform, the air forces also employed a further 422,000 civilians performing a host of technical, administrative, and service duties such as ferrying aircraft or serving in the Civil Air Patrol. Some 1,000 women served in the WOMEN AIRFORCE SERVICE PILOTS (WASP), a quasimilitary civilian organization that performed a variety of piloting tasks for the army air forces.

In September 1939 the air force possessed 2,470 aircraft, largely obsolescent types, although new state-of-the-art models, such as the B-29 Superfortress, were already in development. By its peak strength in July 1944, the air force had nearly 80,000 operational aircraft of all types and descriptions from fighters, reconnaissance and cargo aircraft to light, medium, and heavy bombers, many of them rated among the best in the world in terms of bomb load capacity, technical and mechanical performance, durability, and ability to deliver firepower in the air and on the ground.

During World War II the army developed 16 separate air forces (the First through 16th), 11 of these serving either in strategic, reconnaissance, patrol, or tactical roles in the European theater and the Pacific theater, or in Panama, the Caribbean, or Alaska. Four of these air forces remained in the United States for purposes of continental defense and training. The organization and equipping of the air forces varied widely depending on roles and missions, but each force most usually contained fighter, bomber, and air service commands. Other air forces, such as the Ninth Air Force in Europe, played a primarily tactical support role, while the Eighth and 15th Air Forces in Britain and the Mediterranean, respectively, and the 20th Air Force in the Mariana Islands conducted largely strategic bombardment missions. The 10th Air Force in India provided tactical ground support in the China-Burma-India theater and organized and flew the "Hump" supply route over the Himalayas to Nationalist China.

The combat units in an air force varied widely as well, with the group, roughly equivalent to an army ground unit, serving as the main administrative and operational unit. Altogether the air forces created 243 fully equipped groups, each consisting of three or four squadrons, the basic combat unit. Squadrons were described and numbered according to function, and they normally did their training together and fought together as a unit. In 1944, a squadron, which contained three or more flights or aircraft, contained from seven B-29 Superfortress bombers up to 25 fighter aircraft, numbering from 200 to 500 men.

By the end of the war, the U.S. Army Air Forces had taken delivery of some 158,000 aircraft out of the 300,000 produced by the United States for itself and for the GRAND ALLIANCE. The force included 51,221 bombers and 47,000 fighters, of which nearly 23,000 were lost in combat. During the war the air force flew over 2,363,000 combat sorties, dropped 2,057,000 tons of bombs (more than 75 percent of that on Germany), and expended 459,750,000 rounds of ammunition. Casualties numbered 115,383, including 40,061 dead, of whom 17,021 were officers.

**Arnold, Henry H. ("Hap")** (1886–1950)

*commanding general of U.S. Army Air Forces*

The commanding general of the U.S. ARMY AIR FORCES during World War II, an aviation pioneer, and a leading proponent of AIR POWER, Henry Harley "Hap" Arnold is

considered the creator of the modern United States Air Force.

Born in Gladwyne, Pennsylvania, Arnold graduated from West Point in 1907. In 1911, he volunteered for flight training with the Wright Brothers, and was one of the first army aviators. During World War I, he served in Washington overseeing the training of flying units and the acquisition of air bases. In the 1920s and 1930s, Arnold served at a number of military posts where he developed his ideas on the uses of air power and the importance of technology. In 1938, he was promoted to the rank of major general and assumed command of the U.S. Army Air Corps (later the U.S. Army Air Forces).

Arnold played a vital role not only in building the U.S. Army Air Forces during World War II but also in furthering ANGLO-AMERICAN RELATIONS and the prosecution of the war. Recognizing the danger posed by the German Luftwaffe, Arnold began working in the late 1930s to impress upon President FRANKLIN D. ROOSEVELT the need to expand America's air strength. His efforts contributed to CONGRESS appropriating billions of dollars for the expansion of the army air forces from 1939 to 1941. Among Arnold's first tasks was to allocate aircraft production between expanding the U.S. forces and those of Allies under the LEND-LEASE Act, and he served as President Roosevelt's air adviser at the ATLANTIC CHARTER conference of Roosevelt and British prime minister Winston Churchill in 1941. Early in 1942, Arnold agreed to a British-American strategic BOMBING offensive in Europe. As a member of the American Joint Chiefs of Staff and the British-American combined staffs, Arnold attended the CASABLANCA CONFERENCE and the POTSDAM CONFERENCE. In 1944 he was promoted to the rank of five-star general.

General Arnold was known for his brusque and demanding style of command. More an organizer and builder than a strategist, he realized technology's importance and sponsored research into advanced electronics and aeronautical design. By war's end, his command had grown from fewer than 20,000 men and 300 aircraft to some 1.8 million personnel and well over 60,000 aircraft. He retired in early 1946 because of a heart condition. Even in retirement his influence continued, as he pushed to make the air force a separate branch of the armed forces, and for the use of missiles. (The U.S. Air Force was created in 1947.) Arnold died in 1950.

## art and architecture

From 1929 to 1945, American art and architecture underwent important developments that reflected both long-term trends and the momentous events of the era. Modernism (a broadly defined movement based upon the intentional rejection of traditional, classical methods of artistic expression) continued to profoundly influence American art, but the social and political context of the GREAT DEPRESSION and the NEW DEAL had a significant impact as well. Aided by a large influx of European artists, New York City especially revealed the growing accomplishments of American art and architecture and increasingly displaced Paris as the world capital of art.

Architectural achievement in the period included the continued prominence and productions of Frank Lloyd Wright and the emergence of urban skyscrapers, most notably in New York. A modernist architect with natural instincts, the Wisconsin-born Wright continued to build upon the legacy he had established in earlier decades. His most notable achievement of the era was the rustic Falling Water (constructed between 1936 and 1939), a blended, modernistic and Japanese-styled home built in the secluded woods of Pennsylvania near Pittsburgh.

Meanwhile, architecture in the New York City area in the interwar years came to epitomize the very notion of the modern big city. Especially in Manhattan, the 1920s and early 1930s witnessed the rise of the skyscraper as a powerful symbol of urban civilization. Relying upon an adapted French art deco style, the New York City skyline was expanded to include the Chrysler Building (designed by William Van Allen and completed in 1930) as well as the world-famous symbol of modern New York City itself, the towering Empire State Building (completed in 1931 under the direction of the architectural firm Shreve, Lamb and Harmon). The architect Raymond Hood, who had been at the forefront of early Manhattan skyscraper development in the 1920s (for example, the Daily News Building and the American Radiator Building), continued to be a powerful architectural force through the 1930s. While the McGraw-Hill Building was one of his notable achievements, he is best known for the Rockefeller Center, begun in 1929 and completed in 1939. Under the patronage of the powerful Rockefeller family, Hood designed the multipurpose area to include such notable venues as the RCA building and the popular Radio City Music Hall (conceptualized by Samuel Lionel "Roxy" Rothafel and designed by Wallace Harrison).

The opening of the NEW YORK WORLD'S FAIR in 1939 further cemented the developing image of New York City as the world's cosmopolitan, architectural center. The modernistic obelisk Trylon and the soaring, triangular Perisphere (also designed by Wallace Harrison) complemented

The home and studio of Frank Lloyd Wright, Chicago, Illinois (*Library of Congress*)

the prophetic Futurama exhibition, designed by Norman Bel Geddes under the sponsorship of the General Motors Corporation. Such international exposure gave New York City a creatively vibrant, cutting-edge feel, and helped to transform the image of Manhattan from one of a crowded destination for industrial immigrants to that of a center for cultural and artistic progressivism. With the construction of the Museum of Modern Art (1929) and the Whitney Museum (1931), New York City was poised to become the new world center for sculpture and painting as well. During World War II, war production and construction needs took priority over such architectural projects in New York and elsewhere.

The leading figure in American sculpture during the period was the innovative Alexander Calder (1898–1976). The inventor of the “mobile” form of sculpture, Calder had studied and worked in Paris prior to coming back to America. Calder constructed abstract figures out of wire, wood,

tin, and other materials, often placing ball-like shapes at the ends. Sometimes, his constructions were enormous (especially later creations, which could approach the size of an airplane), and at other times they were interconnected arcs or leaflike structures that moved with room air currents. Calder’s mechanical engineering background doubtless enabled him to effectively manipulate materials and shapes in unique ways that greatly expanded the creative horizons of modern sculpting.

The Great Depression brought about major changes in the relationship between GOVERNMENT and the arts. Such New Deal programs as the Public Works of Art Project (PWAP) and the FEDERAL ART PROJECT (FAP), undertook various art ventures in order to provide work RELIEF jobs for unemployed artists. The resulting publicly funded paintings, sculptures, and murals often reflected populist and patriotic themes. These works sometimes displayed a noticeably chauvinistic emphasis upon displaying

### 30 art and architecture

the strength of indigenous American character, as well as teaching the necessary public virtues to weather the economic crisis. Generally, the work produced by the federal programs was not highly regarded by art critics, although such subsequently renowned artists as Jackson Pollock and Willem de Kooning were at one time supported by the Federal Art Project.

The increasing role of government in the arts during the depression also offered opportunities to African American artists, particularly the New Jersey-born Jacob Lawrence. As a young man, Lawrence had traveled to New York City, where he was stimulated by the Harlem Renaissance. Lawrence focused on the contemporary Great Migration of AFRICAN AMERICANS from the southern poverty and racism to almost equally grim northern urban areas. During the 1930s and 1940s, Lawrence painted a series of 60 works that came to be known as the Migration Series (originally known as *The Migration of the Negro*). In these paintings, which were influenced by cubism and the French painter Henri Matisse, Lawrence depicted the harsh realities of life for African Americans during the Great Depression. Even while depicting such themes as rural African-American poverty, urban slums, and prison life, however, Lawrence did not display a radical or overtly political ideology in his works, in contrast to more openly leftist artists of the period.

PHOTOGRAPHY continued to develop as an art form in the era, particularly in the Western School of Ansel Adams and others. Also of continuing importance was Alfred Stieglitz (1864–1946), a pioneer in the emergence of photography as a distinct art form who brought European avant-garde artistic styles to America in the late 1800s. Opening in New York City the most influential artistic photography studio in America, Stieglitz was highly active not only in photography but also in promoting modernist painting and sculpture and in lecturing widely, until his death in 1946.

But photography reached a larger audience through the photojournalism of *LIFE* MAGAZINE and the NEWS MEDIA. As with other aspects of art, photography also reflected the social and political currents of the era—not only in the photojournalism of the depression and war years, but also in the documentary photographs of the New Deal's FARM SECURITY ADMINISTRATION (FSA). Such accomplished FSA photographers as DOROTHEA LANGE and WALKER EVANS provided graphic (and often carefully and purposefully composed) depictions of rural poverty designed to develop support for reform programs. During World War II, the FSA's photographic section was transferred to the OFFICE OF WAR INFORMATION, which sought to inspire patriotism as well as to document social change and progress.

*Nighthawks*, painting by Edward Hopper, 1942 (The Art Institute of Chicago)

During the Great Depression and World War II, three camps emerged that defined particular artistic styles and preoccupations: abstract artists, social realists, and regionalists. While the sculptor Alexander Calder clearly was one of the most notable representatives of the abstract wing, other important abstract artists of the period (overwhelmingly centered in New York City) included Fritz Glarner, Burgoyne Diller, Carl Holty, Ilya Bolotowsky, and Charmion von Wiegand. The abstract artists were influenced by Europeans (such as Piet Mondrian and others), and they often produced works of geometric and abstractly utopian construction. In general, however, this group received little attention at the time, perhaps because the economic and social difficulties of the Great Depression tended to point toward a focus upon more realistic themes.

The social realists of the time can themselves be broadly divided into two groups: those artists who were more overtly political from a liberal or leftist perspective and those who can best be characterized as apolitical. Strongly political and leftist themes were injected into the U.S. art scene by the Mexican artist Diego Rivera, whose mural, *Man at the Crossroads*, created a furor for its heroic depiction of Soviet leader Vladimir Lenin. Though commissioned by the Rockefeller family for inclusion in the new Rockefeller Center, the mural so offended the Rockefellers that they removed Rivera, and the mural, from the project. Other politically radical social realist artists included Ben Shahn, Jack Levine, and Philip Evergood, who generally displayed overtly Marxist themes and social commentary in their works.

From a more apolitical perspective, artists such as Stuart Davis and Edward Hopper especially focused on urban scenes and the realities of life in the big city. Davis tended more toward abstraction in his later works, as he was increasingly influenced by the cubist movement. Two of his most noteworthy works were both murals: *Men without Women* (1932) and *Swing Landscape* (1938), itself a piece created under the auspices of the New Deal's WORKS PROGRESS ADMINISTRATION. Davis often drew inspiration from his excursions into various New York City neighborhoods, including Chinatown and JAZZ clubs catering primarily to blacks.

Edward Hopper likewise portrayed landscape and cityscape works that often had the feel of a vignette, and a certain dreamlike character often pervaded his paintings. Hopper depicted the realities and complexities of both rural and especially urban life in 20th-century America, with a special attention given to lighting, shadow, and mood, which often provided his works with a mysterious or even lonely quality. Works such as *Early Sunday Morning* (1930), *Room in New York* (1932), and perhaps Hopper's most notable work, *Nighthawks* (1942), are primary examples of this particular style and emphasis.

From a completely different venue came the work of the regionalists, including such artists as Grant Wood, John Steuart Curry, and Thomas Hart Benton. These artists developed themes relating to small-town, rural, and farm life in the America of the period. Quintessentially American in their portrayal of heartland values, religion, and morality, these artists gained, perhaps surprisingly, a critical following in the sophisticated New York City art world of the day. Notable works of these artists include Wood's *Stone City, Iowa* (1930) and especially his well-known *American Gothic* (1930), Curry's *Baptism in Kansas* (1928), and Benton's *Social History of Missouri* (1935). In a somewhat different vein, the popular artist Norman Rockwell also gave attention to such themes in his mass-produced works. Rockwell's name became practically synonymous with the image of small-town Americana as exhibited in his productions, which provided reassurance in the trying days of depression and war, and his works were deeply beloved by the public at large.

Finally, the mid-1940s witnessed the emergence of the movement that would later become known as abstract expressionism, a phenomenon that would last into the 1950s and beyond. This movement would shift the artistic focus to the examination of Jungian-style concepts and themes, such as the primordial, the primitive, and archetypal explorations. Such notable figures as the "drip" artist Jackson Pollock (*Mural* and *Pasiphae*, both 1943), Willem de Kooning (*Seated Figure*, 1940), and Mark Rothko (*Baptismal Scene*, 1945), would all lay the foundations for this next influential period in American art in the postwar era.

## Asian Americans

Throughout the 1930s and 1940s, many Asian Americans struggled both to preserve their ethnic identity and customs and to deal with increased prejudice and win new opportunities. As it did for other groups, WORLD WAR II ultimately hastened their assimilation and acculturation, though only after severe trauma in the case of Japanese Americans.

Although the term "Asian Americans" can include a variety of peoples from throughout the Asian continent,

Japan, and the Philippines, it typically refers to those from East Asia. (Only a few thousand immigrants from India lived in the United States in this period.) Among the East Asians, Chinese Americans and Japanese Americans were most numerous and prominent. By 1930, primarily as a result of IMMIGRATION restrictions imposed during the late 19th century and early 20th century, culminating in the Johnson-Reed Act of 1924 that among other things essentially prohibited immigration from China and Japan, immigrants from East Asia represented only about 1 percent of the U.S. foreign-born population (and roughly one-tenth of 1 percent of the total population). East Asian immigrants were concentrated in the western states, particularly in California.

Like other immigrant groups, Asian Americans came in search of economic opportunities. Arriving at Angel Island in San Francisco Bay, many immigrants from East Asia looked for work in cities such as San Francisco where they established ethnic enclaves known as “Chinatowns” or “Japan towns.” However, unlike European immigrants in the East, the majority of Asian Americans found employment not as industrial workers but as laborers in the developing agricultural economy of the West and in mining. During the GREAT DEPRESSION, the scarcity of jobs often confined Asian Americans, even those with professional training, to menial jobs in the service sector as domestics.

Opportunities for Asian Americans were limited not only by the depression but by prejudice as well. Nativist groups such as the Asian Exclusion League and the Native Sons and Daughters of the Golden West worked to bar Asian Americans from more desirable occupations. And although some Chinese American workers in the garment industry experienced limited success in the INTERNATIONAL LADIES’ GARMENT WORKERS UNION of San Francisco, Asian Americans were largely kept out of LABOR unions. Federal law prevented Asian immigrants from becoming naturalized citizens, though the American-born children of Asian immigrants did have U.S. citizenship.

Because of the shortage of jobs and the growing extent and cost of RELIEF programs in the 1930s, GOVERNMENT officials wanted to limit additional immigration. The prevailing hostility toward nonwhite groups prompted officials to target MEXICAN AMERICANS and also Filipinos, who as residents of a U.S. territory had enjoyed unrestricted immigration. In 1934, after the Tydings-McDuffie Act pledged independence for the Philippines by 1945, Filipino nationals were classified as aliens, given an annual immigration quota of just 50 people, and disqualified from NEW DEAL programs.

Anti-Japanese sentiment escalated sharply after the bombing of PEARL HARBOR and U.S. entry into World War II. By February 1942, pressure from local political orga-

The 442nd Regimental Combat Team, established in 1943 and composed entirely of Japanese Americans from the mainland United States and Hawaii, was one of the most highly decorated in U.S. history. (*National Archives*)

nizations and the military prompted President FRANKLIN D. ROOSEVELT to issue EXECUTIVE ORDER 9066 that led to the RELOCATION OF JAPANESE AMERICANS from the West Coast. Suffering considerable financial and personal losses, more than 110,000 Japanese Americans—roughly two-thirds of whom were U.S. citizens—were incarcerated in camps. The SUPREME COURT sustained the relocation policy, by far the worst violation of CIVIL LIBERTIES on the WORLD WAR II HOME FRONT, in its 1944 decision in *KOREMATSU V. UNITED STATES*.

For Asian Americans, especially Japanese Americans, World War II marked a turning point in which many communities worked to identify more closely with mainstream America. During the war, an estimated 25,000 or more Japanese Americans, many seeking to demonstrate their loyalty, served in the U.S. armed forces. In fact, the most decorated unit in the U.S. ARMY, with more than 9,000 casualties, was the Japanese-American 442nd Regimental Combat Team. China’s suffering at the hands of Japanese militarism received considerable attention during the war, and Chinese Americans began to gain political influence and support from groups such as the AMERICAN CIVIL LIBERTIES UNION and prominent figures such as publisher HENRY LUCE in campaigns to permit Chinese immigration. After the war, the barriers facing Asian Americans did not disappear, but they began to steadily, if slowly, crumble as Asian Americans sought new opportunities and became more fully accepted members of American society.

### Atlantic, Battle of the (1940–1943)

The Battle of the Atlantic involved the effort of German SUBMARINES to disrupt the shipping of American goods to Great Britain and the Soviet Union. During the most intense period of the Battle of the Atlantic, from 1940 until early 1943, the Germans so threatened imports of American supplies and war materials to Great Britain that near crisis conditions existed. Yet the Allied ability to marshal technology, to organize and coordinate antisubmarine forces, and to produce ships, ultimately assured victory and enabled American LEND-LEASE Act materials to reach their destinations in sufficient quantities.

Germany possessed 40 U-boats in September 1939, but these vessels could not access Atlantic shipping routes

until the German conquest of Norway and France in April and June 1940. That summer, British antisubmarine resources were stretched thin, but CONVOYS soon reduced losses. Grand Admiral Karl Doenitz then ordered U-boats to attack in “wolf packs” of up to 20 U-boats, and the wolf packs sank increasing tonnage from September 1940 into 1941, including 1,299 merchant ships in 1941 alone. Despite British and American successes in CODE BREAKING, and in using improved radio direction-finding equipment, radar, sonar, depth charges, and sea and air escorts, the wolf packs dominated in 1942. U-boats scored successes along the North Atlantic “Murmansk run” to the Soviet Union, in the Caribbean, and along the American coast.

The tide turned quickly between February and May 1943. Allied naval and air forces made better use of intelligence, and the American SHIPBUILDING industry provided more shipping and escort ships with improved antisubmarine weapons. Air cover provided by escort carriers of the U.S. NAVY and by U.S. ARMY AIR FORCES B-24 bombers equipped with radar and searchlights closed the “Atlantic

## 34 Atlantic Charter

gap.” In February 1943, 22 U-boats were sunk, followed by 32 in March and April and 46 in May. Germany then suspended operations, tacitly admitting defeat, and convoys went unmolested to Europe after mid-1943. During the Battle of the Atlantic, the Germans lost 785 out of some 1,160 U-boats and sank nearly 2,600 Allied merchant ships.

### Atlantic Charter (1941)

The Atlantic Charter was a document of common principles issued by U.S. president FRANKLIN D. ROOSEVELT and British prime minister Winston Churchill on August 14, 1941, following a meeting on August 9–12 aboard U.S. and Royal Navy ships in Placentia Bay, off the coast of Newfoundland. The conference marked the first wartime meeting between Roosevelt and Churchill, but the two leaders had divergent aims. Churchill wanted a clear American commitment to join Britain in WORLD WAR II at a time when Britain was facing setbacks in North Africa, the Atlantic, and Southeast Asia. Already, the LEND-LEASE Act of March 1941 had enabled increased material support of England, and Lend-Lease had been extended to the Soviet Union following her invasion by Germany in June 1941. But with most Americans still hoping to avoid entry into the war (the conference came just as the SELECTIVE SERVICE Act was being extended by only one vote in the House of Representatives), Roosevelt wanted to signal cooperation with Great Britain, but to stop well short of an explicit commitment to a military alliance. He also wanted a statement of principles to show that American principles would not be eroded by cooperation with the British or the Soviets.

The Atlantic Charter reflected principles stated in Woodrow Wilson’s Fourteen Points of World War I, including self-determination, disarmament, and economic cooperation. It stated that neither country sought territorial aggrandizement. It acknowledged that all people had the right to choose their own form of government and not have territorial changes forced upon them, and called for free trade and freedom of the seas. The charter also vaguely indicated a desire for “the establishment of a wider and permanent system of general security.” Though ISOLATIONISTS remained suspicious, most Americans felt that Roosevelt had successfully avoided a commitment of war, while many in Britain felt that Churchill had gotten too little and given up too much, including the possibility of los-

ing its colonies. But the conference did serve to symbolize American-British cooperation. The Atlantic Charter itself became a basis of the Declaration of the United Nations in January 1942 and later a foundation of the UNITED NATIONS organization.

### atomic bomb

The atomic bomb was a stunningly powerful new weapon developed during WORLD WAR II that relied upon nuclear fission—splitting the nucleus of a uranium or plutonium atom—to release a tremendous amount of energy. It played a vital role not only in the surrender of Japan in the PACIFIC THEATER of the war but also in the deteriorating relations of the GRAND ALLIANCE after the war.

The wartime race for an atomic weapon began in Germany in 1938 when two scientists discovered a way to split uranium atoms and produce atomic fission. The following year, with the threat of a potential Nazi nuclear arsenal in mind, the physicist Albert Einstein successfully persuaded President FRANKLIN D. ROOSEVELT to undertake an American-sponsored effort to build a bomb. In 1941, the U.S. government’s OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT began secretly coordinating what became known as the MANHATTAN PROJECT. Scores of handpicked researchers at universities across the country confirmed that a fission chain reaction was possible by isolating the rarer uranium isotope U-235 from the more common form, U-238, and later found that a new element, plutonium, behaved the same way. Between 1943 and 1945, army general Leslie R. Groves and physicist J. Robert Oppenheimer directed about 120,000 personnel in the \$2 billion Manhattan Project at installations in 37 facilities in the United States and Canada. A laboratory at Los Alamos, in the New Mexico desert, was responsible for putting the weapon together.

In July 1945, as tests continued, and two months after Germany surrendered, President Harry S. Truman traveled to Germany to meet with his British and Soviet allies at the POTSDAM CONFERENCE. Among other issues, the “Big Three” leaders discussed how to prosecute the war against the sole remaining AXIS power, Japan. At the conclusion of the conference, Truman and new British prime minister Clement Attlee (the Soviets had not yet entered the war against Japan) issued the Potsdam Declaration, which called upon Japan to surrender unconditionally by August 3 or face “prompt and utter destruction,” although

not specifically mentioning the atomic bomb, which had just been successfully tested at Alamogordo. Nor did Truman explicitly inform Soviet leader Joseph Stalin about the bomb (the British had been involved in the project). Rather, as the conference neared its end, Truman (as he later wrote) “casually mentioned to Stalin that we had a new weapon of unusual destructive force.” Stalin, who knew about the Manhattan Project because of Soviet ESPIONAGE, gave little reaction.

As the bomb moved from a potential weapon to an actual one in the spring and summer of 1945, questions arose over whether and how to use the bomb against Japan. It had generally been assumed by policymakers that the bomb would be a legitimate weapon of war, but the reality of the bomb and its immense power reopened the issue. Some of the very scientists who helped create the bomb, Oppenheimer among them, argued for restraint. Others advised Truman to demonstrate the bomb for spectators at a disclosed site or issue a warning to Tokyo. Army Chief of Staff General GEORGE C. MARSHALL, however, argued that using the awesome weapon was preferable to accepting a large number of Allied casualties in an invasion of Japan. The excessive brutality of the Pacific war, anger at Japan, and racial antagonisms also contributed to the decision. So did worsening SOVIET-AMERICAN RELATIONS, for some American policymakers believed that using the bomb would impress the Soviets with American power and resolve and make them more amenable to cooperating on the host of postwar issues facing the Grand Alliance and causing disagreement and tension. Although he admitted “that an atomic bomb explosion would inflict damage and casualties beyond imagination,” Truman went ahead with the prior decision to use it.

On August 6, 1945, the B-29 bomber *Enola Gay* dropped a uranium bomb on Hiroshima, devastating the city and killing up to 50,000 people immediately, with another 50,000 or more dying soon thereafter. Still, the Japanese refused to accept surrender terms. On August 8, the Soviet Union declared war against Japan. On August 9, the United States dropped a plutonium bomb, this time on the port city of Nagasaki, killing at least 50,000, and injuring another 60,000 (see HIROSHIMA AND NAGASAKI). In the face of the new atomic threat, the emperor intervened and offered surrender.

Almost immediately, the atomic bomb began to affect the postwar American economy, foreign policy, domestic affairs, and popular culture. Scientists, cultural critics, and government officials debated control over atomic know-how. Some cold war anticommunists saw the American atomic monopoly as a way to forestall Soviet aggression and intimidation. Idealistic opponents, however, believed that atomic power was so awesome that only international control could preserve the fragile peace. In 1949, the Sovi-

ets shocked Americans when they detonated their first atomic device. This event contributed to the United States adopting a more stringent form of containing communism, launched the development of a hydrogen bomb, and sparked investigations into spying at Los Alamos.

The atomic bomb also triggered conflicting feelings of optimism and fear. In the 1950s, the government promoted atomic energy as an efficient, clean, inexpensive form of power. Unrealistic innovators foresaw a nuclear utopia where atomic power fueled kitchen appliances and automobiles. Others acknowledged the potential danger of radiation fallout by building bomb shelters. All the while, the government’s civil defense program assured Americans that fear had been exaggerated and that the peaceful atom could bring benefits to all.

Issues of control gradually gave way to the threat of proliferation. While the atomic bomb ignited the superpowers’ nuclear arms race, other nations also sought atomic technology. Despite a global nuclear nonproliferation treaty, by the end of the 20th century no fewer than two dozen countries possessed nuclear weapons, many of which were used for leverage against old regional enemies.

## automobile industry

By the 1920s, the American automobile industry had become one of the nation’s most important big businesses, central to the nation’s ECONOMY and to patterns of TRANSPORTATION. The secret to success for the “Big Three” manufacturers (Ford, General Motors [GM], and Chrysler) that dominated the industry was to mass produce automobiles for a mass market, selling the product at a reasonable price and thereby assuring large profits. In fact, GM was the world’s largest industrial corporation, responsible for manufacturing some 40 percent of all passenger cars, trucks, and buses then sold in the world. The United States dominated global auto production, providing 85 percent of all the world’s vehicles and exporting 10 percent of these to foreign markets. Workers were paid well but were nonunion, a condition that Ford and the other corporate heads enforced through various means of infiltration and intimidation. More than half a million people were employed in the automotive industry. In 1929 alone, nearly 4.5 million cars were sold—roughly one for every 25 Americans. The automobile industry

## 36 automobile industry

then suffered during the GREAT DEPRESSION, was crucial to the efforts of LABOR to unionize mass production industries in the 1930s, and played a vital role in economic MOBILIZATION during WORLD WAR II.

The 1930s proved to be a trying decade for automobile industry leaders, who had to cope with the impact of the depression and with NEW DEAL regulatory and labor policies. As automobile sales dropped by three-fourths between 1929 and 1932, production, profits, and employment all plummeted as well. The ranks of new car dealers thinned from 42,000 to 30,000. Against this backdrop, the New Deal's NATIONAL RECOVERY ADMINISTRATION (NRA) drafted codes of fair competition for automobiles as for other industries. Although Ford refused to cooperate, the auto codes were lenient, allowing for industry self-regulation and bypassing NRA Section 7(a)—the guarantee of collective bargaining between employers and workers—with a clause that enabled companies to hire and fire employees for union-related activities.

Another New Deal measure, the NATIONAL LABOR RELATIONS ACT of 1935, which guaranteed the right of collective bargaining and outlawed unfair labor practices, together with the emergence of the CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO) in the mid-1930s, then led to the unionization of much of the automobile industry. The key event in the automotive industry—and because of its significance, in mass production industries more generally—was the 44-day sit-down strike at General Motors' Fisher Body Plant in Flint, Michigan, the largest automobile industry plant in the world. The strike began on December 30, 1936, when workers refused to leave the plant until the demands of the new United Automobile Workers union were recognized, and ended on February 11, 1937, when GM gave in. During the brilliantly organized strike, neither Roosevelt nor Michigan's governor, Frank Murphy, used troops to break up the job action, and GM lost \$175 million in sales as car production dropped from 15,000 per week to barely 150.

Automobiles affected all levels of American life. Here a jeep is used by soldiers on a reconnaissance patrol in 1942. (*Library of Congress*)

As a result of the General Motors strike, UAW membership increased from 98,000 to 400,000 in the first months of 1937. Buoyed by success at GM and Chrysler, the auto-workers' next objective was Ford, but the old carmaker and his vigilante police force—the "Service Department," which intimidated and physically roughed up labor organizers—kept the UAW out until May 1941. But the CIO success with GM and Chrysler in the automobile industry helped produce unionization in the STEEL INDUSTRY and elsewhere.

After the RECESSION OF 1937–1938, when car sales dropped by half, the automobile industry recovered and was rolling out nearly 4 million vehicles by 1941, a million more than two years earlier. Remembering the lean years of the early 1930s, automakers worried about the consequences of converting to defense production at the expense of a growing consumer market and moved slowly and without urgency toward conversion to military production. They continued to produce new cars despite growing shortages of materials and the suspension of new model changes to allow the use of machine tools for military needs. After PEARL HARBOR, the WAR PRODUCTION BOARD ordered suspensions of passenger vehicle production for the duration of the war.

World War II proved a turning point in the history of the automotive industry because it was forced to quickly retool itself for manufacturing wartime material, and it played a large and vital role in the war effort. By dint of its massive factories; huge, highly trained workforce; and its proven capacity for mass production, the industry was strategically well placed to assist in the greater war effort. Not only did the automakers turn out trucks, jeeps, and TANKS, but they produced aircraft parts, machine guns, small arms ammunition, helmets, and binoculars as well. The tally came to 27,000 aircraft, 170,000 boat engines, and more than 5 million guns for military usage—in all, roughly one-fifth of all military supplies made during the war years. By any standard the automobile industry made indelible contributions to the allied cause. For its efforts, GM received \$802 million in public revenues to expand its various facilities, and by war's end the company enjoyed a commensurate 50 percent increase in production capability—paid for by the taxpayer. Conversion to military production led to the employment of new workers, including AFRICAN AMERICANS and women (who at one point constituted one-fourth of the workers in auto industry plants), and to a decline in factory control over workers, which increased workers' power and strikes.

Beginning in 1943, RECONVERSION of the auto plants was planned, but carmakers took part in the so-called war within a war, in which companies still producing war goods opposed others converting to peacetime production. At war's end, with much of the existing passenger vehicle

stock aging or lacking proper parts, the automobile industry began to make up for lost time, as more than 2 million new vehicles were produced in 1946 and nearly 7 million in 1950. In the immediate postwar years, the U.S. automotive industry produced 80 percent of all motor vehicles made in the world.

## Axis

The Axis was a coalition of nations led by Germany, Italy, and Japan that fought against the United States and other nations of the GRAND ALLIANCE during World War II. (See WORLD WAR II EUROPEAN THEATER.)

Several treaties signed from 1936 to 1940 bound Germany, Italy, and Japan together. The first came on October 25, 1936, with the announcement of an "axis" connecting Germany and Italy. A month later, on November 25, 1936, Germany and Japan signed an anti-Comintern treaty aimed at the Soviet Union, and on November 6, 1937, Italy joined Germany and Japan in an anti-Comintern agreement. On May 22, 1939, the "Pact of Steel" brought Germany and Italy into a full military alliance. And then on September 27, 1940, the Rome-Berlin-Tokyo Axis was cemented when Germany, Italy, and Japan signed the Tripartite Pact.

In the Tripartite Pact, signed after Germany had overrun western Europe in the spring of 1940, Germany, Italy, and Japan declared they would assist each other by "all political, economic and military means" if one of them were attacked by a "Power at present not involved in the European War or in the Chinese-Japanese conflict." The two major nations not involved in combat in Europe or Asia in September 1940 were the United States and the Soviet Union. But since a separate article excluded the Soviet Union, which had signed a mutual nonaggression treaty with Germany (the NAZI-SOVIET PACT) in 1939, the treaty was really aimed at the United States and at deterring the U.S. from military action on behalf of Britain or China. By 1940, therefore, Germany and Italy were cooperating in military operations in Europe and North Africa, while Germany, Italy, and Japan had joined together in what amounted to a military treaty of defense against the United States.

Benito Mussolini and Adolf Hitler (left to right) in Munich, Germany, 1940 (*Library of Congress*)

As the 1936 and 1937 anti-Comintern treaties indicated, concerns about the Soviet Union helped to produce the Axis alliance. But each of the three major Axis nations also had broad territorial and political ambitions that lay behind their alliance. In particular, Germany aspired to conquer Europe, establish a “thousand-year Reich” of Nazi domination, and implement the HOLOCAUST to eliminate Jewry, while Japan sought to create and dominate what it called a “Greater East Asia Co-prosperity Sphere.” One Axis strategy was to turn conquered territories into suppliers of their war machines, and in some cases Axis-controlled nations contributed troops to the war effort. Such states as Hungary, Bulgaria, Romania, and Slovakia, as well as the Japanese-controlled government in Manchukuo, became part of the Axis alliance.

Despite growing American opposition to the ambitions and actions of the Axis nations from the late 1930s on, and despite its increasingly pro-Allied and anti-Axis policies in 1940 and 1941, the United States did not enter the war until the Japanese attack on PEARL HARBOR in December 1941. In response to America’s declaration of war on Japan, Germany and Italy declared war on the United States. The

American entry into the war against the three Axis nations helped create the Grand Alliance of the United States, the Soviet Union, and Britain that ultimately defeated the Axis.

In actuality, there was little collaboration and coordination between the Germans and Italians on the one hand and the Japanese on the other. Japan had been angered when Germany concluded the Nazi-Soviet Pact of 1939 despite the anti-Comintern treaties of 1936 and 1937. Germany subsequently did not inform Japan when it abrogated the Nazi-Soviet Pact and invaded the Soviet Union in June 1941, nor did the Japanese tell Germany of their plans to attack Pearl Harbor on December 7, 1941. Japan did not declare war on the Soviet Union after the German invasion of the USSR. During critical points in the war, moreover, Japan and Germany cooperated only minimally, and Hitler criticized the Japanese for not doing more to attack Allied merchant shipping in the Pacific delivering American LEND-LEASE aid to the Soviets.

German and Italy did work together in the EUROPEAN THEATER, with Germany as the dominant partner. They jointly waged the NORTH AFRICAN CAMPAIGN, and Germans contributed in a major way to the defense of Italy during the ITALIAN CAMPAIGN. Italian troops went to the eastern front to support the Nazis in the German-Soviet campaign. But the Italian surrender to the Allies in September 1943 confirmed the German conviction that Italy was an unreliable partner.

The United States’s entrance into the war turned the tide of the war in favor of the Grand Alliance and led to the defeat of the Axis. In the European theater, American Lend-Lease assistance and the U.S. ARMY and the U.S. NAVY contributed importantly to bringing the surrender of Germany in May 1945 and, with it, the effective end of the Axis alliance. In the PACIFIC THEATER, the United States played the major role in defeating Japan, and the Japanese surrender came soon after the use of the ATOMIC BOMB on HIROSHIMA AND NAGASAKI in early August 1945.

### Bankhead-Jones Farm Tenant Act (1937)

AGRICULTURE, particularly in the SOUTH, had been hard-pressed economically before the advent of the GREAT DEPRESSION. After World War I a precipitous drop in crop prices meant that many farmers who were unable to meet their obligations became tenants rather than owners. During the depression years the number of farmers falling into tenantry increased sharply. The fact that many farmers lacked funds to purchase expensive farming machinery, in order to compete successfully in the marketplace, further stoked the rise in tenant farming. By 1935 it was estimated that tenants operated two-fifths of American farms. That year President FRANKLIN D. ROOSEVELT determined, as part of the NEW DEAL, to halt the trend toward farm tenancy and promote ownership through the Bankhead Bill of 1935. This ambitious piece of legislation, capitalized at \$1 billion, would facilitate GOVERNMENT purchase of farmland, which would then be resold to tenants and sharecroppers with easy credit terms. The bill passed the Senate but entrenched conservative opposition killed it in the House of Representatives.

In 1937 Roosevelt again sought to assist farmers with the new Bankhead-Jones Farm Tenant Act. This bill, the product of Senator John Bankhead of Alabama and Marvin Jones of Texas, differed from the original proposal, but it was passed by CONGRESS on July 22, 1937. It was capitalized at only \$10 million for 1938, a sum that rose to \$50 million by 1940. Moreover, the bill was designed to aid only tenants who possessed the capital necessary to make a down payment and could be expected to successfully pay off their obligations in a timely fashion. As such, the new law exerted only a marginal effect on the vast bulk of poor tenants and sharecroppers throughout the hard-hit South. After conservatives in 1941 tied future loans to average farm values in each county, the program languished in many of the poorest regions. The onset of WORLD WAR II dramatically revived the agricultural sector, making the

Bankhead-Jones Act seem less necessary. By 1946, when Congress terminated the FARM SECURITY ADMINISTRATION, which oversaw the Bankhead-Jones program, it had made only 44,300 loans and, overall, had failed to help the lowest tier of subsistence farmers.

### banking

Banking in the United States mushroomed throughout the 1920s, with a total of 30,000 commercial institutions in operation nationwide. However, many banks remained undercapitalized and served RURAL AREAS experiencing distress on account of overproduction and low commodity prices. Banks had previously loaned heavily to farmers during the World War I years, before the postwar price declines set in, and suddenly found themselves unable to collect their money. Consequently, 5,100 rural banks failed between 1921 and 1929. The GREAT DEPRESSION then shook the national banking system to the core when many banks, having invested heavily in stocks or made loans to brokers to buy stocks, found their assets badly depleted. This led to a run on the banking system by depositors desperately seeking to retrieve their savings, and banks were compelled to liquidate their assets to generate cash. Gold and currency hoarding by the general public also became endemic on a national scale. From 1929 to 1932, some 4,300 banks had failed, and President HERBERT C. HOOVER attempted to help by signing into law the RECONSTRUCTION FINANCE CORPORATION (RFC), which was designed to lend money to troubled institutions. But once the names of those institutions receiving RFC funds were published, frightened depositors resumed their hasty withdrawals. Furthermore,

## 40 Banking Act of 1933

the monies provided by RFC proved inadequate, and another 1,453 banks failed in 1932.

Bank collapses were reaching epidemic proportions when Governor William A. Comstock of Michigan ordered all banks to declare a “holiday” on February 14, 1933. By month’s end, no fewer than 21 states had also declared moratoria to stop the panics and hemorrhaging of funds. The first official act of the FRANKLIN D. ROOSEVELT administration was to declare a bank holiday from March 6 to March 9, whereby all banking actions—including money withdrawals—were temporarily suspended in the remaining states. This holiday was subsequently extended by presidential fiat to March 13. On March 12, the president also took to the airwaves in the first of his celebrated FIRESIDE CHATS to assure the American people that the banking system was safe. The public responded favorably to his appeal, and when the banks opened two days later, deposits greatly outnumbered withdrawals. Meanwhile, the EMERGENCY BANKING ACT OF 1933 included provisions for the RFC to help fund banks that appeared economically viable so that they could reopen as quickly as possible. It also received the ability to keep unsound banking establishments closed and placed under the supervision of conservators. Roosevelt was criticized by some liberal Democrats for failing to nationalize the banking system outright, but he took a more conservative route and chose instead to revive the existing system. The next major legislation was the BANKING ACT OF 1933, which established the FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC). This measure, designed to bolster consumer confidence, insured individual bank deposits up to \$2,500. Beyond protecting banks against panics, it further extended federal supervision over a larger number of state banks, thereby dramatically reducing the number of failures. The act also separated investment banking and commercial banking because one of the causes of the stock market crash of 1929 was securities speculation by several leading banks. Even more important was a shift in authority from Federal Reserve Banks to the Federal Reserve Board, which afforded additional oversight on these institutions.

As influential as the 1933 reforms were, Roosevelt intended them only as stop-gap measures as he was facing a myriad of other problems and priorities. Then in 1935 newly appointed Federal Reserve Board chairman MARLINER ECCLES approached the president with a plan to increase the powers of the Federal Reserve Board while also centralizing control of banking in Washington, D.C. Roosevelt was receptive to the idea, and on February 2 he signed the BANKING ACT OF 1935 into law. This was the most sweeping banking reform since creation of the Federal Reserve in 1913 and mandated changes in the overall structure of the entire system. Hereafter, regional Federal Reserve banks came under the control of the Fed-

eral Reserve Board and a new Board of Governors, whose members were appointed for 14-year terms. The chairman served a term of only four years. More important, the new board enjoyed abilities to directly control reserve requirements, discount operations, interest rates, and open-market operations. Members also became responsible for appointing the heads of district banks. Their new power signaled a new concentration of power in the Federal Reserve Board, whereby centralized banking became a distinguishing feature of the American banking industry.

Despite their far-reaching effects, the bank reforms initiated by President Roosevelt as part of the NEW DEAL were decidedly conservative in outlook and a far cry from the nationalization and direct government control called for by many in the Democratic Party. But the banking system was stabilized, and public confidence was restored. These reforms also ensured that abuses arising from securities speculation by banks, a leading cause of the stock market crash, would not be repeated. Hereafter, federal deposit insurance became a common and welcome fixture in banks across the nation, while centralized control of the entire banking process through the Federal Reserve Board, unthinkable before 1929, also became an accepted reality.

### Banking Act of 1933

The Banking Act of 1933, also known as the Glass-Steagall Act, was the first piece of NEW DEAL legislation to bring significant reform to the BANKING system. Developed by CONGRESS and signed by President FRANKLIN D. ROOSEVELT on June 16, 1933, the act’s main provisions were to separate commercial and investment banking, to create the FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC), and to increase the power of the Federal Reserve Board. It played a major role in strengthening and stabilizing American banking.

Banking policy of the early 20th century allowed commercial banks to trade in stocks and bonds and underwrite securities. This practice was never seriously challenged until the STOCK MARKET CRASH of 1929, which wiped out billions of dollars in assets. Because banks could not turn their greatly devalued paper assets into cash, they were often unable to pay off panicked depositors. As the GREAT DEPRESSION deepened in the early 1930s, thousands of

banks failed and countless individual bank accounts were lost. When President Roosevelt was inaugurated in March 1933, the banking system was in crisis and had been temporarily shut down by banking “holidays” declared in state after state. The EMERGENCY BANKING ACT OF 1933 restored confidence and brought the reopening of the banking system, but it did not bring fundamental change.

Although Roosevelt wanted to defer further banking legislation, members of Congress thought reform was essential. In mid-May, Senator Carter Glass (D-Va.) and Congressman Henry Steagall (D-Ala.) proposed their bill to address problems in banking. The prohibition against commercial banks from also engaging in investment banking ended a practice that had contributed not only to the liquidity crisis of the early 1930s but also to speculation that had helped bring on the stock market crash. The Glass-Steagall Act prohibited commercial banks from underwriting or dealing in corporate securities. The act’s most important contribution to banking stability, at first opposed by Roosevelt and most bankers, was the creation of the FDIC (initially called the Temporary Deposit Insurance Corporation). The FDIC insured individual bank depositors up to \$2,500 (raised to \$5,000 in 1934), a crucial guarantee that eliminated the individual investor’s fear of losing deposited money and thus prevented bank panics and resulting bank failures. The Glass-Steagall Act also gave the Federal Reserve Board new power over open-market operations (selling and buying government securities to affect interest rates), an important reform carried further by the BANKING ACT OF 1935.

The Glass-Steagall Act, especially the creation of the FDIC, brought stability to the banking industry and a sharp reduction in bank failures. In fact, fewer banks suspended operations between 1933 and 1940 than in any single year in the 1920s. Ironically, the Roosevelt administration received credit for a major and successful measure that really originated in Congress.

### Banking Act of 1935

Recognized as the last major accomplishment of the SECOND NEW DEAL of 1935 and as the most important BANKING reform of the NEW DEAL, the Banking Act of 1935 produced the first substantial modification of the Federal Reserve system since its inception in 1913. It gave the federal GOVERNMENT effective control of the banking system and MONETARY POLICY.

In 1934, President FRANKLIN D. ROOSEVELT appointed MARRINER ECCLES to head the Federal

Reserve Board, and Eccles then drafted a banking bill that would give the federal government more control over money and credit. Sent to CONGRESS in February 1935, the bill passed the House of Representatives relatively easily. It encountered resistance in the Senate, however, particularly from Virginia’s Carter Glass, a principal architect of the 1913 Federal Reserve Act who opposed centralized federal control of banking, and from many private bankers, especially the big New York bankers. In June, FDR made the bill a “must” item of legislation. Despite the fact that Glass rewrote much of the bill, the final draft, though not as far-reaching as originally intended, kept many of Eccles’s main objectives intact.

The banking act, signed by Roosevelt on August 23, 1935, had several key features. It created a strong, central board of governors of the Federal Reserve System that could control the operations of regional banks and manage discount and interest rates. The law centralized open-market operations (the sales and purchases of government securities to affect interest rates) in the Federal Open Market Committee in order to reduce the influence of the private bankers and to consolidate control of the U.S. money market. The law also empowered the president to appoint seven members to this newly formed board of governors, with the consent of the Senate, for 14-year terms. Eccles was appointed chairman of the new board of governors. Finally, the act also completed the implementation of deposit insurance and the FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC), which was initiated under the BANKING ACT OF 1933. State banks were required to join the Federal Reserve System before July 1, 1942, if they wanted the benefits from the FDIC.

**Baruch, Bernard M.** (1870–1965) *financier, presidential adviser*

A millionaire stock speculator, Bernard Baruch offered advice to the administration of President FRANKLIN D. ROOSEVELT, as he did to presidents from Woodrow Wilson to Lyndon B. Johnson. He assiduously cultivated the press and his own public image as the “park-bench statesman” and adviser to presidents.

Bernard Mannes Baruch was born in South Carolina, graduated from City College of New York, and became a millionaire by the time he was 30 by virtue of his success on the stock market. During World War I, President Wilson

## 42 Bataan Death March

appointed Baruch head of the War Industries Board, and Baruch won a favorable public reputation for his role in helping to increase American war production. He was an influential member of the DEMOCRATIC PARTY during the 1920s, and gave financial support to many Democrats in the CONGRESS, especially those sharing his pro-BUSINESS views.

In the ELECTION OF 1932, Baruch did not endorse Roosevelt until after FDR had won the Democratic nomination. Though a number of Roosevelt's advisers were wary of Baruch, his standing in the Democratic Party and the money he could bring to the campaign led Roosevelt to suggest that he consult with the BRAIN TRUST on industrial recovery policy. Baruch's protégé, General HUGH JOHNSON, became the first administrator of the NATIONAL RECOVERY ADMINISTRATION, a NEW DEAL agency modeled on the War Industries Board. Other Baruch associates, including George Peek, the first head of the AGRICULTURAL ADJUSTMENT ADMINISTRATION, also had significant roles in New Deal programs. Baruch himself remained close to conservative Democrats, had a good relationship with ELEANOR ROOSEVELT, and maintained his cordial relations with the press.

Baruch's relationship with FDR and other New Dealers remained strained, however, as his career in WORLD WAR II revealed. At first, Roosevelt attempted to keep him at arm's length, but Roosevelt eventually named him to lead an investigation of the RUBBER shortage. FDR then agreed that Baruch might become head of the WAR PRODUCTION BOARD (WPB), but the president backed away from the appointment and it never eventuated. Toward the end of the war, Baruch coauthored a report on RECONVERSION for the WPB that played an important role in shaping reconversion policy in a way favorable to business.

After the war, Baruch presented American recommendations on atomic energy to the UNITED NATIONS. But President Harry S. Truman, like others, thought Baruch self-serving and cut ties with him after Baruch refused to serve on Truman's 1948 reelection committee. Nonetheless, Baruch's public reputation remained such that Presidents John F. Kennedy and Lyndon B. Johnson made a point of consulting with him in the 1960s.

### Bataan Death March (1942)

On April 9, 1942, an estimated 10,000 American and 60,000 Filipino troops surrendered to the Japanese on the Bataan Peninsula of Luzon island in the PHILIPPINES. On the subsequent "Bataan Death March," the Japanese drove

Photograph taken of American and Filipino soldiers during the Bataan Death March (*National Archives*)

the 70,000 PRISONERS OF WAR (POWs), the largest seizure ever of American forces, on a brutal 65-mile journey to prison. Some 600 Americans and nearly 10,000 Filipinos died when the Japanese clubbed, bayoneted, or shot stragglers. Thousands more died in prison camps. The Bataan Death March was one of the events producing a fierce animosity toward Japan during WORLD WAR II.

The Japanese had landed in northern Luzon in December 1941 after the attack on PEARL HARBOR, and pushed American forces south to Bataan and Corregidor Island. On April 9, the embattled and weakened American and Filipino contingent, without sufficient ammunition, food, or medicine to continue effective resistance, surrendered. The Japanese, who were unprepared for so many prisoners and who did not respect them because they had surrendered, forced the POWs to march northward to Camp O'Donnell in the hot sun without food and water. Along the way, the Japanese subjected their captives to a variety of cruel humiliations, and to death by decapitation, beating, gunfire, or bayonets if they were to stop.

After reaching Camp O'Donnell, the remaining prisoners died at the rate of one person every 45 minutes. With only three badly working water taps, diseases such as malaria and dysentery along with starvation and dehydration took their toll. Another 1,500 Americans and at least 25,000 Filipinos died by July 1942. Beginning in June, the Americans were moved to a better-equipped POW camp on the other side of Manila Bay with those who had surrendered on Corregidor on May 6. Gradually, these pris-

oners would be split up and put to work for the Japanese until their eventual liberation at the end of the war. The Filipinos who remained behind at Camp O'Donnell were released at the end of July.

—Ronald G. Simon

**Berle, Adolf A., Jr.** (1895–1917) *government official*  
Adolf Augustus Berle, a member of the BRAIN TRUST of FRANKLIN D. ROOSEVELT and later an assistant secretary of state, was born January 29, 1895, in Boston, Massachusetts, to devoutly Christian and socially active parents. Berle graduated from high school at age 12 and earned his bachelor's, master's, and law degrees from Harvard University by the time he was 21. He practiced law and taught at Harvard Business School, developing expertise in corporate law and Latin American affairs, before joining the faculty of Columbia Law School in 1927. Heavily influenced by the Social Gospel movement, he entered public life through service with New York City's Henry Street Settlement House.

In 1932, RAYMOND C. MOLEY introduced Berle to Roosevelt, and Moley, Berle, and REXFORD G. TUGWELL formed the nucleus of FDR's Brain Trust. Also in 1932, *The Modern Corporation and Private Property* appeared, coauthored with the economist Gardiner C. Means. The book became Berle's most influential publication and articulated his intellectual contribution to the Brain Trust. He believed that the modern corporate economy had concentrated power in the hands of a professional managerial class, out of reach of stockholders and public control, a situation that required federal intervention through reform of the BANKING system and securities markets. As the most moderate of the Brain Trusters, and still steeped in his Social Gospel roots, Berle believed businessmen could be "converted" to a more responsible brand of capitalism rather than being forced to do so by the GOVERNMENT.

After Roosevelt's victory in the ELECTION OF 1932, Berle did not immediately take up a post in the administration, although he continued as a presidential adviser. He advised FIORELLO La GUARDIA in his successful 1933 New York City mayoral race and served as city chamberlain for three years. In 1938, Berle became an assistant secretary of state for Latin American affairs, and in this position played a crucial role in implementing Roosevelt's GOOD NEIGHBOR POLICY and advocating collective security in the Western Hemisphere after the outbreak of WORLD WAR II in 1939. During the war, his duties included coordinating the

INTELLIGENCE activities of the State Department. By 1944, however, Berle had lost much of his earlier influence with Roosevelt, and his notorious arrogance had alienated most of his State Department colleagues. In November 1944, he resigned his position as assistant secretary of state.

Berle then served for a year as ambassador to Brazil before returning full-time to his law practice and teaching. In later years, he remained active in public life, and although never regaining his earlier influence, served with such organizations as Radio Free Europe and John F. Kennedy's Interdepartmental Task Force on Latin America. Berle died in New York City on February 17, 1971.

**Bethune, Mary McLeod** (1875–1955) *educator, civil rights leader, presidential adviser*

Mary McLeod Bethune, an educator and the leading member of the BLACK CABINET of the NEW DEAL era, was an advocate for CIVIL RIGHTS and education for the black community and for New Deal efforts to assist AFRICAN AMERICANS. One of 17 children born to an illiterate sharecropper in South Carolina, Bethune was schooled at the

Mary McLeod Bethune (National Archives)

Presbyterian Mission School, graduated from Scotia Seminary in North Carolina in 1893, and then received two years of higher education at Moody Bible Institute in Chicago. In 1898 she married Albertus Bethune, and they had one son, Albert. After leaving Moody, Bethune went to teach in the SOUTH and in 1904 founded the Daytona Normal and Industrial School for Negro Girls, which later became Bethune-Cookman College in Daytona Beach, Florida.

In 1927, Bethune began an important personal friendship with ELEANOR ROOSEVELT after a meeting of the National Council of Women, where Bethune was the only black woman invited. She introduced Roosevelt to influential African Americans and educated her about race relations and racial inequalities. In 1935 she helped found the National Council of Negro Women, and throughout the 1930s fought for racial justice on a variety of issues, including the effort to free the black youths convicted in the SCOTTSBORO BOYS case. She also supported ANTI-LYNCHING LEGISLATION, demonstrated against the poll tax, worked for extended employment and educational opportunities for blacks, and urged federal support of the SOUTHERN TENANT FARMERS UNION, which sought to help tenant farmers and sharecroppers.

Bethune's formal relationship with FRANKLIN D. ROOSEVELT and the New Deal began in 1936, when she asked to meet with FDR regarding the impact of the NATIONAL YOUTH ADMINISTRATION (NYA) on minority groups. Roosevelt appointed Bethune as head of the NYA's Division of Negro Affairs, which made her the highest-ranking African American in the government. She became the leader of the Black Cabinet, an informal but significant group of black federal officials who worked to increase New Deal attention and assistance to African Americans.

Bethune received numerous honorary degrees and awards, and her writings include *What the Negro Wants*, *Spiritual Autobiographies*, weekly columns in newspapers, and articles in publications of the National Council of Negro Women. She continued her civil rights work until her death in 1955.

## big bands

Musically speaking, the 1920s was the "Age of JAZZ" but, by decade's end, a new form of jazz requiring larger ensem-

bles and a more forceful style of delivery began evolving. In terms of impact, it was one of the first popular styles aimed directly at younger audiences. The new style quickly acquired the name "big band" since it usually required instrumentation by three trumpets, three trombones, five saxophones, and numerous guitars, pianos, and drums. The GREAT DEPRESSION, which led to high UNEMPLOYMENT rates among musicians and a commensurate lowering of wages, further facilitated the formation of big bands. As with jazz, AFRICAN AMERICANS were quick to assert themselves creatively within the new format, and noted performers such as DUKE ELLINGTON, Louis Armstrong, and Cab Calloway began popularizing the sound among black and white audiences alike. In 1937 William "Count" Basie emerged with his own unique style of black music, which was based on carefully scripted precision and not the free-wheeling innovation of many contemporaries. Soon the big band sound, also called "swing" by jazz musicians, began permeating dance and concerts halls across the nation. It was further spread by the growth of RADIO and noted venues such as the Cotton Club in Harlem, which attracted a racially mixed audience. Ironically, the most successful exponent of the period was a young white clarinetist, BENNY GOODMAN, who soon gained a reputation as the "King of Swing." He was joined by competing bands led by Artie Shaw, Tommy and Jimmy Dorsey, and Glenn Miller. Miller's was one of the most popular bands of the WORLD WAR II era, and he led it at home and abroad until his death in an airplane crash in 1944. The big band sound continued after World War II as the sound of a mass youth culture, but it gradually lost popularity in the 1950s owing to increasing expense associated with large bands. Youthful musical tastes began moving toward rock and roll, which centered upon individual artists backed by far fewer musicians.

One important sidelight to big band music was its decidedly racial component. Black musicians were at the forefront of the big band sound throughout this period and, while they usually played to segregated white audiences, music began bridging the social and cultural divide. It also exposed millions of white youths to African-American-inspired music and also introduced black slang, or *jive*, into the mainstream culture. In this sense big bands helped transcend racial barriers on the stage, for white bandleaders began employing black performers such as BILLIE HOLIDAY, Lionel Hampton, and Roy Eldridge in their acts. Big band music thus afforded minority musicians greater and more favorable exposure to white audiences on a scale that would not be repeated until the onset of rock and roll music. In this significant respect, big bands helped pave the way for growing acceptance of black musicians and mixed audiences that finally arrived in the 1950s.

—John C. Fredriksen

**Black, Hugo L.** (1886–1971) *U.S. senator, associate justice of the Supreme Court*

Hugo Lafayette Black was a United States senator from Alabama (1927–1937) and the first SUPREME COURT justice appointed by President FRANKLIN D. ROOSEVELT.

Black was born on February 27, 1886, in Clay County, Alabama. He attended the University of Alabama Law School, graduating in 1906. Black's practice in Birmingham focused on the concerns of working-class whites, including personal injury litigation. He also served as a police court judge and public prosecutor, where he demonstrated great concern for CIVIL LIBERTIES. After army service in the United States during World War I, Black returned to an expanding law practice. To make contacts, he joined several organizations, including the Ku Klux Klan. Black was first elected to the Senate in 1926.

Reelected to a second term in 1932, Black became one of the strongest supporters of the NEW DEAL and gained significant attention for his investigation of public utility corporations. His dramatic style during legislative hearings delighted the press, but overshadowed his hard work in winning passage of significant legislation including the FAIR LABOR STANDARDS ACT, the PUBLIC UTILITY HOLDING COMPANY ACT, and the TENNESSEE VALLEY AUTHORITY. Black also supported some of President Roosevelt's less successful ventures, including the 1937 COURT-PACKING PLAN proposed after the Supreme Court overturned major New Deal programs in the mid-1930s.

Roosevelt nominated Black to the Supreme Court in August 1937, and after confirmation by the Senate, Black took his seat on the Court that month. Shortly thereafter, reports of his membership in the Klan made headlines. A storm of controversy raged until Black addressed the nation, admitting his past Klan membership but repudiating the Klan and declaring the matter closed. Though Black wrote the majority decision in *KOREMATSU V. UNITED STATES* (1944) that upheld the RELOCATION OF JAPANESE AMERICANS—he maintained that military necessity justified the policy—any doubts about his commitment to justice for Americans of all races were dispelled during the remainder of his career.

In his early years on the Court, Black joined the new liberal majority in decisions sustaining activist federal policy. During his 34 years as justice, Black became known especially for his belief in absolute freedom of speech; for

his strict, literal interpretation of the Constitution; and for his view that the Fourteenth Amendment required the states to abide by the limitations set by the first eight amendments.

After several strokes, Black retired from the Supreme Court on September 17, 1971. He died eight days later.

—Jill Frahm

## Black Cabinet

An informal, self-organized advisory group in the administration of President FRANKLIN D. ROOSEVELT, the "Black Cabinet" worked to improve the impact of NEW DEAL programs on AFRICAN AMERICANS. Sometimes also referred to by the press as the "black Brain Trust," though participants called themselves the Federal Council on Negro Affairs, the Black Cabinet included a changing group of African Americans holding official positions in the GOVERNMENT. The most important members of the Black Cabinet included MARY McLEOD BETHUNE, director of the Division of Negro Affairs in the NATIONAL YOUTH ADMINISTRATION (NYA); William H. Hastie, assistant solicitor in the Department of the Interior (and later appointed by FDR as the first black federal judge); Robert C. Weaver, adviser for Negro affairs in the PUBLIC WORKS ADMINISTRATION; and Robert Vann, assistant to the attorney general.

Often meeting at Bethune's home, the Black Cabinet sought to identify and recruit gifted black men and women to serve in government positions, to make the Roosevelt administration more sensitive to the problems of black communities, and to influence federal policies affecting African Americans. Their recommendations ranged from avoiding racial slurs in speeches and stories, to desegregating government cafeterias, to ensuring that African Americans got their fair and needed share of government programs. In such efforts, the Black Cabinet sometimes found ready allies from administration figures, including ELEANOR ROOSEVELT, Secretary of the Interior HAROLD ICKES, relief administrator HARRY L. HOPKINS, and NYA director Aubrey Williams. The Black Cabinet also fielded complaints and inquiries from black constituents, with some being forwarded to the White House's attention, and they provided information to the press on discriminatory aspects of the New Deal and of government programs.

The impact of the Black Cabinet was both significant and limited. It marked a distinct break from the absence of a significant black voice in the federal government and served to raise the consciousness of FDR and New Deal officials. In part because of its efforts, Roosevelt

appointed many more African Americans to federal positions than had previous administrations. And the Black Cabinet had some impact on New Deal programs. Thanks to Bethune and Aubrey Williams, the NYA gave substantial assistance to African Americans, while Harold Ickes worked to ensure that Public Works Administration projects hired black workers. Other New Deal agencies—the WORKS PROGRESS ADMINISTRATION and the CIVILIAN CONSERVATION CORPS, for example—were less discriminatory than they might otherwise have been. Yet New Deal programs frequently did discriminate against African Americans, often but not always because of local implementation; and in view of their disproportionate UNEMPLOYMENT and poverty blacks rarely got their full share of New Deal help despite the continuing efforts of the Black Cabinet.

Despite such limits, the Black Cabinet had both real and symbolic importance. It represented a change from past administrations, and it helped push the New Deal further than it would otherwise have gone in giving attention and help to African Americans. Many black Americans recognized and appreciated such change, and both by its efforts in Washington and by its active campaigning, the Black Cabinet helped Roosevelt win black votes as African Americans began to shift decisively to the DEMOCRATIC PARTY in the ELECTION OF 1936. By the end of the 1930s, as WORLD WAR II approached and attention went increasingly to FOREIGN POLICY and defense issues, the Black Cabinet became less active and influential.

Roosevelt,” *Journal of Negro History* 60 (January 1975): 1–28; Nancy J. Weiss, *Farewell to the Party of Lincoln: Black Politics in the Age of FDR* (Princeton, N.J.: Princeton University Press, 1983 [esp. chapter 7]).

## black market

In order to allocate consumer goods fairly during WORLD WAR II, the OFFICE OF PRICE ADMINISTRATION (OPA) administered the RATIONING program of the federal GOVERNMENT. To prevent inflation, the OPA regulated prices in the wartime system of WAGE AND PRICE CONTROLS. Though generally successful, rationing and restrictions on consumer spending proved unpopular in a nation just emerging from the GREAT DEPRESSION and with money to spend again after a decade of hard times. As a consequence, an illegal “black market” existed on the WORLD WAR II HOME FRONT.

Home front Americans understood the need for rationing and controls, but even though overall consumer spending increased during the war, the public did not enjoy or always abide by the rules. In order to buy additional amounts of coveted but scarce and rationed goods—gasoline, for example, or meat, or sugar, or shoes—people sometimes would pay prices above the established limits or buy items without using the required rationing coupons. Most black market violations took place in established retail operations between merchants and customers, and proved difficult for the OPA to prevent. Up to one-fourth of Americans surveyed said that it could be justifiable to purchase goods on the black market. One study estimated that one in five businesses received warnings about such activities and that one in 15 were charged with illegal operations. By some estimates, up to half of all businesses were involved in black market activities of various kinds. The court system generally gave no more than light fines to the few who were prosecuted and convicted.

Some of the rationed items proved especially susceptible to flourishing black market activities. Gasoline rationing, particularly unpopular because it limited the use of automobiles for both necessary and recreational driving, gave rise to an extensive black market. Here, organized criminals played an important role by producing counterfeit ration coupons that they sold both to gasoline station operators and to drivers. Legitimate coupons were stolen from OPA offices (coupons for 20 million gallons were lifted from the Washington, D.C., office) and sold at a premium. Motorists sometimes sold excess coupons to service stations or to other drivers—or gave them to friends, which was also an infraction of the rules. Working with the FEDERAL BUREAU OF INVESTIGATION, the OPA took such measures as it could to stop these and other black market activities, but the agency estimated that 5 percent of all gasoline sold was sold illegally. Similarly, an active black market existed for tires.

Food was another source of widespread black market activities, especially when shortages occurred. Meat gave rise to especially serious black market operations, including the resurgence of cattle rustling in some places and selling the stolen beef to cooperating packers and butchers. Wholesalers and retailers would sell meat and poultry above ceiling prices in a variety of ways, including taking side payments, or giving short weights. Another practice was the so-called red market, whereby a low grade of meat was sold for higher-grade prices or where more bone or fat than allowable was included. “Tie-in” sales, requiring customers to purchase an unpopular item in order to get a desired one, also took place in meat as with other items. Expensive restaurants apparently turned to the black market to ensure meat for their customers. Sugar, coffee, and other desirable scarce items also experienced black market operations.

The majority of home front Americans participated only incidentally at most in black market activities and supported efforts to end them—partly because the black market often siphoned goods away from legitimate sales. Some communities organized campaigns that reduced such operations. Even so, the black market was a reality on the World War II American home front, an indication that many people were unwilling to experience sacrifice that they thought excessive or unfair or even inconvenient, and that many merchants were willing to profit from scarcity.

### blitzkrieg

Blitzkrieg, or “lightning war,” was the tactic of rapid attack with massive numbers of mechanized infantry and tank divisions covered by close air support that enabled the German army to quickly invade and overrun Poland, Scandinavia, the Low Countries, and France in the early stages of WORLD WAR II. Blitzkrieg doctrine was to use highly mechanized armored forces to win quick victories, robbing the enemy of time to mobilize their forces and resources, and thus avoid a war of attrition that Germany was ill prepared to win.

Blitzkrieg tactics were developed from the traditional German military doctrine of encirclement and annihilation, and from the high losses during the static trench warfare during World War I. During the interwar period, the German general staff adopted the idea that TANKS should be separated from traditional infantry units and be used with motorized infantry units or operate independently. Tanks could be used to destroy the enemy's front lines, and then penetrate deep into the rear areas, destroying the enemy's command and control infrastructure and its will to fight. In theory, the use of mechanized forces in unison with tactical AIR POWER would allow movement of some 250 miles per day and devastate the enemy before they could form any resistance.

Europe got its first taste of blitzkrieg warfare on September 1, 1939, when 50 divisions of the German army rolled across the German-Polish border, and Poland surrendered by the end of the month. The true power of blitzkrieg was demonstrated in the spring of 1940. Using amphibious landings, paratroopers, and panzer divisions, the German army swept into Scandinavia in April 1940 with such speed that Denmark surrendered within a few hours and Norway was subdued in a few weeks. Then, on May 10, 1940, Germany invaded the Low Countries of Belgium, Holland, and Luxembourg. Four days later, German forces moved through the Ardennes Forest, north of the useless Maginot

line, and pivoted north toward the English Channel, eventually trapping the majority of the Allied army in the port of Dunkirk. The remaining French forces crumbled in front of the German onslaught and France surrendered in less than 40 days from the start of the invasion.

The greatest asset of blitzkrieg proved to be its largest drawback. While blitzkrieg gave the German army the ability to drive large distances over a relatively short period of time, it required huge amounts of supply and support to sustain such long-distance drives. It could not be successful against an enemy that could trade soldiers and space for time, a lesson that Germany would learn from the ultimately disastrous invasion of the Soviet Union in 1941.

### bombing

As early as January 1941, U.S. ARMY AIR FORCES representatives in London, England, began conferring with their Royal Air Force counterparts about the possibility of waging large-scale strategic bombing campaigns against Nazi Germany in the WORLD WAR II EUROPEAN THEATER. By that time British nighttime strategic bombing against German industrial targets involved area bombing of cities and industrial sectors to displace workers and the urban populations living there. The Americans, however, objected to such practices on a moral basis, preferring instead to use daylight precision raids against specific factories, which would cut down on collateral damage to civilians. The unexpected onset of war with Japan in December 1941 and the U.S. entry into WORLD WAR II complicated American war planning, so it was not until August 17, 1943, that a force of 12 Boeing B-17 Flying Fortresses, based in England, successfully struck the German marshaling yards of Sotteville-les-Rouen, France, and returned unscathed. The strategic campaign against the German heartland had commenced in earnest on August 13, 1943, when the U.S. Eighth Air Force massed two air groups to strike the aircraft factory at Regensburg and the critical ball bearing plant at Schweinfurt. Nearly 400 heavily armed B-17s were committed to combat, and they scored relatively good results, but tenacious resistance from German fighter and antiaircraft defenses knocked 60 of the giant bombers from the sky. A similar raid against Schweinfurt on October 14, 1943, brought the loss of another 60 aircraft. Given this staggering attrition, General Carl Spaatz suspended deep raids into Germany over the ensuing four months until large numbers of North American P-51

Mustang escort fighters, which could accompany bomber streams to Berlin and back, were deployed. Large-scale bombing resumed in January 1944, and this time Americans targeted oil production and transportation centers and urban areas, with crippling results to the defenders. By the time Germany surrendered in May 1945, large swaths of its industrial sector had been laid to waste by concerted British and American bombing, its air force was largely grounded due to lack of fuel, and its transportation net was almost completely shattered.

Operational conditions in the WORLD WAR II PACIFIC THEATER represented new challenges in TECHNOLOGY and logistics. Because of the vast distances involved, American strategic bombing of Japan did not materialize until August 1944, when a group of new Boeing B-29 Superfortresses flew from bases deep in China and hit the Yawata steel plants. Results from high-altitude bombing proved disappointing, largely because the Americans were unaware that a 200-mile-per-hour jet stream was directing their bombs off target. Sustained bombing efforts could not commence until the fall of the MARIANA ISLANDS in November 1944, which brought the B-29s much closer to their target. However, results from high altitude still proved unimpressive until a new commander, General Curtis E. LeMay, ordered his aircraft stripped of armament and sent in at low altitude, at night, with incendiary bombs. Results proved devastating, and the Tokyo raid of March 9–10, 1945, devastated large sections of the city, killing upwards of a half-million people. The tactic proved all the more devastating as Japanese housing construction was preponderantly of highly flammable wood. The Americans then enacted a sustained bombing effort of Japanese cities until the end of the war, although the Imperial government stubbornly refused to surrender. President Harry S. Truman, fearful of the casualties arising from a land invasion of the home islands, ordered two atomic bombs dropped on HIROSHIMA AND NAGASAKI in August 1945, and Japanese authorities finally capitulated and ended the war.

On November 3, 1944, President FRANKLIN D. ROOSEVELT authorized the United States Strategic Bombing Survey to analyze the aerial campaigns against Germany and Japan. Roosevelt, mindful of future developments, wanted to evaluate AIR POWER as a component of military strategy and its role in future national defense planning. The scientifically collated results suggested that, while the bombing campaign gutted oil production, halted submarine production, and made decisive inroads on ammunition and truck procurement, it was hardly the panacea that aerial advocates had envisioned. Moreover, while bombing did make significant contributions to the fall of Germany and Japan, it was not decisive in and of itself and cannot be isolated from the general collapse of either nation.

### Bonus Army (1932)

As the GREAT DEPRESSION deepened in the early 1930s, UNEMPLOYMENT reached at least one-fourth of the workforce and impoverished Americans increasingly looked to the federal GOVERNMENT for help. Asking for prepayment of a bonus due them beginning in 1945, World War I veterans constituted one group asking for federal assistance. In 1931, CONGRESS enacted (over the veto of President HERBERT C. HOOVER) legislation allowing the veterans to borrow up to half the value of their bonus. Then in 1932, some 20,000 veterans and family members—the “Bonus Army”—went to Washington, D.C., to demand full payment of their bonus. Hoover’s response in not just opposing the bonus but having the military forcibly disperse the Bonus Army contributed to his landslide defeat in the ELECTION OF 1932.

The “Bonus Expeditionary Force,” as the bonus marchers called themselves (after the American Expeditionary Force of World War I), came from across the country to urge Congress to pay their benefits immediately. Traveling by car, on trucks, in empty railroad cars, and even by foot, the Bonus Army arrived in Washington, D.C., in the late spring of 1932. Most lived in tents and huts in a makeshift camp in Anacostia Flats just outside the city. Some moved into empty federal buildings in downtown Washington.

President Hoover, who insisted that a balanced budget was essential for recovery from the depression, opposed accelerating the bonus payment. He also objected to prepaying the bonus because he thought it would set a bad precedent and encourage other groups to seek RELIEF assistance from the federal government—something the HOOVER PRESIDENCY firmly opposed. Many members of Congress, however, supported the veterans’ request. The Patman Bonus Bill, proposed in June 1932, called for immediate payment to the veterans and passed the House of Representatives. It was then defeated in the Senate, as Republicans and many Democrats agreed with Hoover that the bill would further harm the ECONOMY by seriously unbalancing the budget.

Following the failure of the Patman Bonus Bill, several thousand marchers departed, but others stayed on. Hoover, who never met with the veterans, had the White House put under armed guard, and in late July his administration ordered the veterans removed from the unused

Members of the Bonus Army at their tent city in Washington, D.C., before being evicted by the U.S. Army (*Library of Congress*)

federal buildings they occupied. On July 28, the Washington police took over the buildings, and in one confrontation two marchers were shot and killed. Hoover then directed the army to remove the marchers from the downtown area. Commanded by General Douglas MacArthur, some 600 troops, using tear gas, rifles affixed with bayonets, and light tanks, cleared downtown Washington and, with men, women, and children fleeing before them, moved on to empty and burn the Anacostia camp. One baby died from the tear gas.

MacArthur's use of force went beyond Hoover's orders, but the country blamed the president, who defended the army's actions and held the marchers themselves responsible for the consequences. Other administration officials claimed that the Bonus Army had been dominated by criminals and by radicals. But, as most people understood, the bonus marchers were in fact dispirited, down-and-out people who had served their country and wanted help from the government in the hard times of the Great Depression. In Washington, the marchers organized committees to operate the camp safely, disavowed Communist efforts, and with rare exceptions proved peaceful and law-abiding. The military action against the Bonus Army was an appalling episode that sent Hoover's popularity plummeting still further and spelled his certain defeat in the coming election.

The dispersal of the Bonus Army did not end the bonus issue. In May 1933, roughly 1,000 veterans came to Washington, hoping that the new president, FRANKLIN D. ROOSEVELT, would support their cause. Roosevelt also opposed accelerating the bonus payments (although

he did implement federal relief programs for the unemployed and destitute), but he was able to handle the protest far more adeptly than Hoover had the year before. His wife, ELEANOR ROOSEVELT, met the marchers to discuss their concerns, showing that the administration cared about their needs. Realizing that Roosevelt would veto any bonus bill, this second bonus march dispersed peacefully. Veterans finally succeeded in securing their bonus early in 1936, when Congress passed a bonus bill over Roosevelt's veto.

### **Borah, William E.** (1865–1940) *U.S. senator*

William E. Borah was one of the most visible progressive Republicans of the interwar years and one of the staunchest ISOLATIONISTS in FOREIGN POLICY. Known as the Lion of Idaho for his forthright and eloquent stands, he was also called the "spearless leader" by one colleague because his independence left him with little influence among fellow senators.

Born near Fairfield, Illinois, on June 29, 1865, Borah settled in Idaho on the advice of a fellow train passenger as he headed west to pursue a legal career. Borah became a successful prosecuting attorney, married an Idaho governor's daughter, and became involved in local REPUBLICAN PARTY politics. Elected by the Idaho legislature to the U.S. Senate in 1906, Borah served five and a half terms as senator until his death.

In the Senate, Borah became a progressive Republican, supporting regulation of big BUSINESS and other reforms. He supported American entry into World War I, but opposed U.S. membership in the League of Nations and remained a firm isolationist in the 1920s in his position as chairman of the Foreign Relations Committee. Borah backed HERBERT C. HOOVER for president in 1928, but along with other Republican progressives became disillusioned with the HOOVER PRESIDENCY and its response to the GREAT DEPRESSION. He refused to support Hoover for reelection in 1932, and was hopeful that the new president, FRANKLIN D. ROOSEVELT, would pursue a progressive agenda.

Borah endorsed much of the early NEW DEAL, but his steadfast individualism and distrust of big GOVERNMENT led him into vocal opposition by the time of Roosevelt's 1937 COURT-PACKING PLAN. In 1936, although 71 years old, Borah briefly ran for president, dropping out

after winning the Wisconsin primary but doing poorly elsewhere; in the fall, he refused to support Republican nominee ALFRED M. LONDON in the ELECTION OF 1936. He remained among the ardent isolationists in the 1930s, supporting the NEUTRALITY ACTS and opposing American military aid to Great Britain and France after WORLD WAR II erupted in Europe in 1939. Borah died in Washington, D.C., on January 19, 1940.

**Bourke-White, Margaret** (1904–1971) *photojournalist* Margaret Bourke-White was born in the Bronx, New York, on June 14, 1904, the daughter of an engineer and amateur photographer. She attended various colleges and also married and divorced before finally graduating from Cornell University in 1927 with a degree in biology. While at Cornell she supported herself by taking and selling photographs of students and the campus. Smitten by PHOTOGRAPHY, Bourke-White subsequently opened her own photographic studio in Cleveland, Ohio, while also employed by the natural museum there. At this stage in her career she was fascinated by anything industrial, and her coverage of factories and machines came to the attention of editor HENRY LUCE in 1929, who invited her to work for his new magazine *Fortune*. One of Bourke-White's first assignments was to photograph industry in the Soviet Union, which led to her first book, *Eyes on Russia* (1931). Back in America, she returned to industrial topics until 1934, when she switched to covering the DUST BOWL and the Plains States. The following year she was voted one of the 10 most successful women in New York City and, a year later, won similar kudos as one of the 10 most outstanding women in the nation. Following a brief marriage to writer Erskine Caldwell, she published another noted work on poor southern sharecroppers entitled *You Have Seen Their Faces* (1937), shortly after Luce signed her on as one of the four original photographers for his new *LIFE MAGAZINE*. Bourke-White's dramatic photo of Montana's Fort Peck Dam was chosen to adorn the cover illustration of the magazine's premiere issue.

Bourke-White continued functioning as a *Life* photo correspondent throughout WORLD WAR II. In this capacity she was the only foreign photographer in Moscow during the German invasion of 1941, and she gained further distinction as the only female photographer accredited by the U.S. ARMY. She also became the first woman to accompany and record a U.S. ARMY AIR FORCES bombing mission and also the first to document the horrors of the newly

liberated Buchenwald concentration camp in Germany. Among the leading and noteworthy personalities she covered were FRANKLIN D. ROOSEVELT, Joseph Stalin, Winston Churchill, Haile Selassie, and Pope Pius XII. After World War II Bourke-White functioned as a wide-ranging photojournalist for *Life*, and her topics included South African miners, the 1948 war between India and Pakistan, and the Korean War, which she attempted to cover from a Korean perspective. In 1956 she was diagnosed with Parkinson's disease and gradually retired from photography in favor of writing. She published her autobiography, *Portrait of Myself* (1963), and was the recipient of several photographic awards before succumbing to her illness in Stamford, Connecticut, on August 27, 1971. Bourke-White remains celebrated for her 26 years as a globe-trotting photojournalist who thrived on danger in a profession traditionally dominated by men.

**Bradley, Omar N.** (1893–1981) *American general* General Omar Nelson Bradley's tactical skills and firm but low-key leadership helped secure the Allied victory in the EUROPEAN THEATER of WORLD WAR II. His concern for his soldiers, celebrated by the journalist ERNIE PYLE, won him the reputation as the "G.I.'s general."

Born on February 12, 1893, in Clark, Missouri, Bradley graduated from the U.S. Military Academy at West Point in the famed class of 1915, which included Dwight D. Eisenhower. He remained on the home front during World War I and served in a variety of posts, including a number of U.S. ARMY schools, in the interwar period. In 1941, General GEORGE C. MARSHALL offered Bradley the position of Commandant of the Infantry School at Fort Benning, Georgia. This assignment brought Bradley the rank of brigadier general, and in 1942 he was promoted to Major General. In February 1943, Bradley was sent to North Africa, and in April he assumed command of the U.S. Army II Corps, directing important victories in the successful NORTH AFRICAN CAMPAIGN. Later in 1943, Bradley helped plan and implement the invasion of SICILY, and he was promoted to lieutenant general.

Bradley's greatest contributions came during and after the 1944 INVASION OF NORMANDY. After commanding the U.S. First Army at Normandy, Bradley was put in charge of the 12th Army Group, which comprised the Ninth, First,

and Third Armies and included roughly one million soldiers. Bradley led the 12th Army Group in the Allied advance across France and helped win the Ardennes campaign and the BATTLE OF THE BULGE in the winter of 1944–45. He then played a leading role in the drive westward through the Rhineland and the Ruhr area that ended with the surrender of Germany in May 1945. He was promoted to full general in 1945.

In 1948, President Harry S. Truman named Bradley army chief of staff. He then served as chairman of the Joint Chiefs of Staff from 1949 to 1953 and was promoted to five-star rank—general of the army—in 1950. Bradley retired in 1953.

## Brain Trust

The “Brain Trust” was the collective name given to a small group of academics who advised FRANKLIN D. ROOSEVELT and provided ideological foundations for the FIRST NEW DEAL of 1933. Assembled at Roosevelt’s request in 1932 by RAYMOND C. MOLEY, a professor of government at Columbia University’s Barnard College, the original and most important members of the Brain Trust were Moley, Columbia University economist REXFORD G. TUGWELL, and Columbia Law School professor ADOLF A. BERLE, JR. Roosevelt referred to these advisers as his “privy council,” and then a newspaper reporter dubbed them the “Brains Trust” in September 1932.

While the members of the Brain Trust often disagreed about what specific policy measures would end the GREAT DEPRESSION, they did agree that the depression was the result of structural flaws in the American ECONOMY, that antitrust and other efforts to restore an economy of small units were misguided, and that the economy should function, with appropriate planning, as an organic structure of interdependent parts. Corporate interests, in their view, had gained a disproportionate amount of power over the American economy in the years preceding the depression and had upset the balance of parts. Borrowing from the English economic theorist J. A. Hobson, the Brain Trusters held that, left unchecked, this imbalance had caused a crisis of “underconsumption” in which consumers could no longer afford to buy enough products and services to sustain prosperity. Moley and Berle believed this imbalance would be best remedied by allowing BUSINESS to regulate itself to eliminate unfair business practices. Tugwell, who believed that depressed farm prices caused by agricultural overproduction were central to problems in the domestic

economy, maintained that a GOVERNMENT-planned economy was required for economic recovery and balanced prosperity.

The First New Deal, as it took shape under the leadership of the Brain Trust, combated the Great Depression much differently from previous attempts by the HOOVER PRESIDENCY. In its insistence that the causes *and* solutions for the depression were domestic in nature, the Brain Trust rejected Hoover’s internationalist approach. The ideas of the Brain Trust contributed to the NATIONAL RECOVERY ADMINISTRATION (NRA) and the AGRICULTURAL ADJUSTMENT ADMINISTRATION (AAA), both of which involved economic planning and controls coordinated by the government. The NRA, created to implement the NATIONAL INDUSTRIAL RECOVERY ACT (NIRA) in 1933, sought to implement industry-wide codes of fair competition and improve employment practices in the manufacturing sector, while the AAA sought to raise agricultural prices by reducing output and granting subsidies to farmers who cut production. In practice, both the NRA and the AAA faced significant obstacles in achieving their established goals and had disappointing and sometimes unintended results.

The Brain Trust was most influential during 1932–33 in creating philosophical foundations of the First New Deal, but was less successful in directing the subsequent implementation of NEW DEAL policy. Many DEMOCRATIC PARTY politicians were suspicious of the Brain Trust and feared that their status as nonelected advisers to the president gave them undue influence in policy decisions without the accountability of having to answer to constituents. Political considerations made Roosevelt reluctant to associate himself with any specific economic philosophy for fear of alienating the conservatives within his own party. The problems of the NRA and the AAA only heightened Roosevelt’s increasing tendency to turn to other advisers and ideas. The Brain Trust was effectively disbanded when Raymond Moley left the Roosevelt administration in 1933. The other two original members, Tugwell and Berle, continued to work closely with Roosevelt until 1936 and 1944, respectively; but like Moley, although not for the same reasons, they would express disappointment with the subsequent path of the New Deal.

Despite the limits on their actual influence on policy-making, the Brain Trust left an important legacy, for their proximity to Roosevelt helped inspire a generation of idealistic and ambitious young liberal lawyers and scholars to enter careers with the federal government.

—Mary E. Carroll-Mason

**Bretton Woods Conference** (July 1944)

The United Nations Monetary and Financial Conference, commonly known as the Bretton Woods Conference, took place in New Hampshire in July 1944. It resulted in the establishment of two organizations: the International Monetary Fund (IMF), to facilitate international monetary cooperation; and the International Bank for Reconstruction and Development (IBRD, usually called the World Bank), to provide loans to individual nations and to the United Nations Relief and Rehabilitation Administration (UNRRA) for postwar rebuilding and development. The IMF and IBRD were designed to underwrite world peace and prosperity by preventing another global depression and the economic nationalism that many thought had contributed to the coming of WORLD WAR II.

Several dozen nations met at Bretton Woods, with the United States leading the discussions. The American position reflected long-term concerns of Secretary of State CORDELL HULL about the dangers of high tariffs and other forms of economic nationalism. But the principal American figures in creating the Bretton Woods system, with its emphasis on currency convertability, expanded trade, development loans, and a healthy, cooperative world economy, were Secretary of the Treasury HENRY T. MORGENTHAU, JR., and his assistant secretary, the economist Harry Dexter White.

The United States emerged from World War II with a large accumulation of gold and credits and a strong industrial economy. This great economic strength, together with American power in wartime and postwar global politics, made it virtually inevitable that the United States would dominate the Bretton Woods conference and the instrumentalities it created. The U.S. Senate approved the Bretton Woods agreements in July 1945, and by December 1945 the required number of governments had ratified the treaties establishing the IMF and the IBRD. The Soviet Union took part in the conference but did not participate in the Bretton Woods system because of worsening SOVIET-AMERICAN RELATIONS as the cold war developed.

The main objective of the International Monetary Fund was to prevent the currency devaluations of the 1930s that had seemed so harmful to international economic and political stability. It sought to protect and stabilize short-term foreign exchange rates without jeopardizing a country's domestic economic goals and production levels, and to standardize international monetary transactions in a smooth, efficient system that would promote free trade, stability, and prosperity. The U.S. plan that emerged from Bretton Woods protected the GOLD STANDARD and established the dollar as the world's dominant currency. IMF operations were disappointing in the early postwar period, but the agency did help to establish the principle that cur-

rency devaluations not be used in international economic competition.

The International Bank for Reconstruction and Development was to provide loans at reasonable interest rates to underwrite the reconstruction of economies damaged by World War II and to promote investments and growth in developing countries. The goal was a healthy, growing world economy. The United States, as the largest subscriber to the World Bank, had the principal voice in its operations, and in the early postwar period saw that it channeled assistance to European countries whose economic difficulties made them vulnerable to communist inroads. Such assistance was connected to American "containment" policy in the cold war and prefigured the Marshall Plan assistance to Europe. Smaller developing nations did not get the sort of assistance envisioned in the initial agreements.

Like the American leadership in creating and implementing the UNITED NATIONS, the Bretton Woods system reflected the new role and power of the United States in global affairs and its determination to use its power in pursuing its own interests and principles as well as global peace and prosperity. In the early postwar era, the IMF and IBRD became tied to American containment policy in the cold war, but both would play larger roles in subsequent decades in fostering currency convertability and stability and in providing loans for economic development.

—Anne Rothfeld

**Bridges, Harry** (1901–1977) *labor activist*

An Australian-born maritime worker who identified with the radical and militant elements of the LABOR movement, Harry Bridges played an important role in the resurgence of organized labor in the United States during the GREAT DEPRESSION.

Bridges was born on July 28, 1901, into a middle-class household near Melbourne, Australia, and went by the name Alfred Renton Bridges. A number of experiences and people in his early life exposed him to dissenting ideas, including his uncle Harry, an official of Australia's main labor party, whose name Bridges adopted. Bridges left home when he was 16 to pursue adventure as a sailor, and journeys to the slums of Bombay and London impressed upon him the degree to which capitalism could materially and spiritually impoverish working people. Bridges also learned of protest tactics and strategies as a participant in the massive 1917 general strike in Australia and as a brief

recruit of the International Workers of the World (IWW) while unemployed in New Orleans.

In 1922, Bridges found work as a longshoreman on the San Francisco waterfront and experienced its dreadful working conditions. Longshoremen who did not belong to the company union had to endure the humiliation of the morning “shape-up” in which throngs of men waited on the docks in hopes of gaining temporary employment. Blacklists, kickbacks, and favoritism often influenced hiring decisions, and speedups rendered already dangerous work even more threatening to life and limb. Bridges joined the International Longshoremen’s Association (ILA), but its conservative leadership refused to seek change. The Great Depression severely aggravated these hardships, leaving Bridges without work and his family on RELIEF and pushing him and many other longshoremen toward unionism and radicalism.

GOVERNMENT sanction of union organizing under the NATIONAL INDUSTRIAL RECOVERY ACT (NIRA) of the NEW DEAL inspired longshoremen to act. When 12,000 Pacific Coast longshoremen went on strike in May 1934, area seamen and teamsters joined them, as did more than 100,000 San Francisco workers who waged a general strike to protest police violence against unionists. Bridges became an effective union organizer and a major spokesperson for the longshoremen. Despite the use of strikebreakers, the longshoremen won union recognition, a pay increase, a shorter workweek, and an end to the hated shape-up.

The solidarity displayed by various maritime workers during the strike quickly crumbled. Seamen returned to the tradition of craft-oriented and racially discriminatory unionism, while Bridges and his ILA supporters championed industrial unionism. This conflict mirrored larger splits occurring within the labor movement during the 1930s between the AMERICAN FEDERATION OF LABOR (AFL) and the CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO). In 1937, Bridges led an overwhelming majority of Pacific Coast longshoremen into the CIO to form the International Longshoremen’s and Warehousemen’s Union (ILWU). Emphasizing common economic interests among workers, he welcomed AFRICAN AMERICANS into the ILWU and helped to organize a multiethnic force of sugar and pineapple plantation workers in Hawaii.

Between 1934 and 1962, Bridges fought a number of attempts on the part of his enemies in BUSINESS, government, and organized labor to force his deportation on the grounds that he sought to overthrow the government by force. These legal battles intensified considerably with the revival of ANTICOMMUNISM following WORLD WAR II. Although he apparently joined the Communist Party, according to his biographer, Bridges always denied membership, and he avoided deportation. In any event, he was

guided less by communist ideology than by a commitment to addressing the needs and desires of longshoremen.

By the 1960s, rapid technological changes undermined the bargaining power of skilled workers. Bridges accepted mechanization in return for a hefty pension benefit for older longshoremen, an agreement that contributed to high unemployment, unsafe working conditions, and a large temporary workforce on the docks. He died in 1977.

### Britain, Battle of (1940)

The Battle of Britain, waged between Great Britain and Germany in the summer and fall of 1940, was the first battle in history conducted entirely by AIR POWER, as Germany attempted to gain air supremacy over Britain in preparation for an invasion. Although the German effort was ultimately unsuccessful, the threat to Great Britain, following the success of the German BLITZKRIEG in overrunning western Europe in the previous months, was instrumental in the shift of American FOREIGN POLICY to anti-AXIS intervention through such measures as the DESTROYERS-FOR-BASES DEAL.

The German Luftwaffe forces based in France, the Low Countries, Norway, and Denmark consisted of 1,260 medium bombers, 320 dive-bombers, and more than 1,000 fighters. Continental bases were a mere 20 minutes from England, but German fighters had a short range, and Luftwaffe twin-engine fighters and dive-bombers could not match the RAF Supermarine Spitfire or Hawker Hurricane. In addition, German bombers carried small bomb loads.

The British Royal Air Force (RAF) Fighter Command operated over home ground, which allowed longer times in the air and rapid pilot recovery. Increases in fighter production in 1939, an efficient ground-to-air communications network, and a radar system along the southern coast, gave a slight advantage to the 600 RAF pilots flying 900 fighters.

Early skirmishes in the Battle of Britain began in July 1940, with combat beginning in earnest on August 13, called “Eagle Day,” when the Luftwaffe attacked in strength. The period of mid- to late August was one of heavy fighting, with RAF pilots flying multiple sorties each day. Yet both sides overestimated the other’s casualties and their own successes. German intelligence failures caused a shift in tactics based on the assumption that the RAF had suffered irreplaceable losses. The Luftwaffe starting

## 54 Brotherhood of Sleeping Car Porters

attacking airfields, but then shifted to terror BOMBING of cities, particularly London, in retaliation for an RAF raid on Berlin on August 25. Regular daylight attacks on London, known as the Blitz, began on September 7. The RAF responded quickly against Luftwaffe bombers over London on September 15, known as “Battle of Britain Day,” and downed 175 aircraft in one week, prompting a suspension of daylight raids. While the Blitz continued with decreasing intensity through May 1941, attacks on airfields never resumed, and the planned German invasion was canceled on September 17. Between July 31 and October 31, the RAF lost 788 aircraft compared to 1,295 Luftwaffe aircraft destroyed. Referring to the RAF’s successful defense of Britain, Churchill memorably said that “Never in the field of human conflict was so much owed by so many to so few.”

### Brotherhood of Sleeping Car Porters

The Pullman Company of Chicago, Illinois, employed large numbers of AFRICAN AMERICANS as porters beginning in the late 19th century. By 1920 the number reached 12,000, making it the largest private employer of blacks in the nation. However, low wages and insistence upon a servile attitude led to formation in 1925 of the Brotherhood of Sleeping Car Porters (BSCP), which insisted upon improved working conditions and greater respect for its members. The labor union achieved initial success in New York, where it first formed, but faltered in the Chicago region, where the Pullman Company, however paternalistic in nature, enjoyed deep roots in the black community, and resistance to the BSCP proved surprisingly strong. But the union, headed by A. PHILIP RANDOLPH, adopted a community-based strategy of winning over leaders such as clergymen, editors, and politicians, and by 1929 the union enjoyed a surging membership. This trend promptly ended with the onset of the GREAT DEPRESSION that year, and membership declined from 7,300 to only 658 in 1933. However, the BSCP was strategically placed to carry the message of unionism within African-American communities, and it began allying itself with the AMERICAN FEDERATION OF LABOR (AFL) to forge interracial alliances during those difficult times. But the union’s fortunes were not revived until the election of FRANKLIN D. ROOSEVELT as president in 1932 and the introduction of labor-friendly NEW DEAL legislation. Foremost among this was the Railway Labor Act as amended in 1934, which guaranteed railroad

workers the right of collective bargaining. Randolph also heightened his national visibility in the black community by serving as president of the National Negro Congress in 1936, and he began applying pressure upon Pullman for greater recognition. A year later the company signed a historic agreement with the BSCP, marking the first time an American corporation entered into a labor agreement with an all-black union.

Although concerned with the working conditions of its members, Randolph also agitated for a broad-based social agenda. His threat of a MARCH ON WASHINGTON MOVEMENT and protest in Washington, D.C., induced President Roosevelt to sign EXECUTIVE ORDER 8802 in June 1941, which banned discrimination in GOVERNMENT and defense-related employment and also led to establishment of the FAIR EMPLOYMENT PRACTICES COMMITTEE. In July 1948, Randolph used the BSCP’s leverage with Democrats to have President Harry S. Truman sign Executive Order 9981, which effectively ended segregation in the U.S. military. Over the ensuing decades airlines largely supplanted railways as the national mode of TRANSPORTATION, and in 1978 the BSCP merged with the Brotherhood of Railway and Airline Clerks. Prior to this it had performed seminal work in spreading unionism among black workers and committing the government to policies reflecting greater social justice.

### Bulge, Battle of the (December 1944–January 1945)

In the six months after the INVASION OF NORMANDY in June 1944, American and British forces drove the German army from France and began threatening the German border. In December 1944, the Germans launched a counteroffensive in the Ardennes Forest in Belgium in a desperate effort to halt the Allied advance and capture the vital Belgian port of Antwerp. This last German major thrust in the EUROPEAN THEATER of WORLD WAR II was named the Battle of the Bulge, because of the wedge that the Germans drove into the Allied lines before American forces repelled the German attack.

Early in the morning of December 16, 1944, the Germans attacked vulnerable American positions in the Ardennes Forest, sending them reeling back in surprise and confusion. But the German army soon encountered fierce American resistance. When the Germans demanded the

American soldiers of the 75th Division in the Ardennes during the Battle of the Bulge (U.S. Army)

surrender of the key town of Bastogne on December 22, General Anthony McAuliffe, personifying the courage and resiliency of American troops in the battle, replied with his famous single-word message: “Nuts!”

The tide turned for the Allies by December 23. In a remarkable feat of generalship, General GEORGE S. PATTON, JR., had wheeled his Third Army northward from the Moselle to attack the German flank from the south. The fog and heavy clouds that grounded Allied air forces lifted, and Allied planes resupplied isolated garrisons and began to attack the German troops and supply lines. The German advance was halted just miles from the Meuse River by the U.S. First Army on December 26. The extent of the “bulge” that the Germans created was some 60 miles deep and 50 miles wide at the base—a considerable salient, but well short of Hitler’s ambitious objectives. By mid-January, the battle had been won, and by end of the month the Allies were ready to press ahead into Germany.

The Battle of the Bulge was the largest engagement on the western front, and the largest that American soldiers—who did almost all of the fighting—had ever been part of.

More than a half-million American troops were involved, and the American casualties of at least 70,000 (virtually the entire Allied total and more than in any other battle of the war) included some 20,000 dead. British prime minister Winston Churchill said that the Battle of the Bulge would “be regarded as an ever-famous American victory.” Turning back this final German offensive and depleting the Germans’ reserves of manpower and equipment, this victory effectively secured the fate of Nazi Germany and led to its surrender in May 1945.

### Bureau of Motion Pictures

Throughout WORLD WAR II the United States did not possess a centralized PROPAGANDA agency to dictate feature film content. However, on June 13, 1942, President

FRANKLIN D. ROOSEVELT signed an executive order creating the OFFICE OF WAR INFORMATION (OWI) to oversee and coordinate domestic and foreign propaganda relating to the war effort. Among its various subdivisions was the Bureau of Motion Pictures (BMP) under White House assistant Lowell Mellett, with offices in New York; Washington, D.C.; and Hollywood, California. The New York office under playwright Sam Spewack became responsible for government information films produced at the OWI's behest. The 26 titles, known collectively as "Victory Films," were documentary in nature and portrayed various facets of the GOVERNMENT war effort in a favorable light. BMP also oversaw an additional 52 short films entitled "America Speaks." They were aimed directly at public audiences and intended to be screened in tandem with regular motion pictures at theaters, although smaller 16mm prints were released for schools, churches, and community centers. Given this mass distribution, an estimated 4.7 million people had seen at least one title by 1943.

BMP's Hollywood office was headed up by Nelson Poynter, who enjoyed close professional contacts with the film community and was charged with providing them with guidelines for assisting the war effort. His office wrote and distributed a pamphlet entitled *The Government Information Manual for the Motion Picture*, which contained voluntary guidelines. BMP agents were allowed to review scripts and make suggestions as to how best to portray America at war. Some changes in dialogue or emphasis could be requested and were usually made, although in some instances the bureau did ask that certain MOVIES not be filmed or distributed until after the war. Moreover, the agency wished that the military always be shown in a positive light, never surrendering, and invariably fighting to the end. Ultimately, the BMP reviewed 1,650 scripts and compliance for suggested changes remained completely voluntary. However, BMP's influence ended abruptly in May 1943 when Republicans in CONGRESS, fearful that the agency was promoting "Democratic" values for political ends, sharply reduced its funding.

**Bush, Vannevar** (1890–1974) *electrical engineer, science administrator*

Vannevar Bush, born in Everett, Massachusetts, the son of a Universalist minister, is best known for directing the mas-

sive effort to mobilize American SCIENCE and TECHNOLOGY for WORLD WAR II. His classic manifesto, *Science: The Endless Frontier*, written at the request of President FRANKLIN D. ROOSEVELT as a proposal for continuing this mobilization during peacetime, inspired the creation of the National Science Foundation and other GOVERNMENT funding organizations of the cold war.

During undergraduate work at Tufts College, doctoral studies in electrical engineering at the Massachusetts Institute of Technology, and various work with industry and the military, Bush developed an early faith in technology and its potential for public good. He held strong beliefs on ethics and public responsibility for engineers. As a professor in electrical engineering and later dean of engineering at MIT (1919–39), he was at the center of curricular reforms in this fast-developing field so closely connected with industry. Known for his administrative acumen, he also won respect as an able and innovative researcher in engineering science for his work in solving difficult quantitative engineering problems using graphical methods and analog computers.

In 1939, Bush became president of the Carnegie Institution of Washington, and also served as chairman of the National Advisory Committee on Aeronautics. Soon after arriving in Washington, he was at the center of mobilizing science and technology for the war effort. He instigated and chaired the National Defense Research Committee, which was quickly succeeded in 1941 by the OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT (OSRD) as the war MOBILIZATION effort expanded. Enjoying a close and trusted relationship with President Roosevelt, personal acquaintance with numerous industry leaders, familiarity with and respect in the university world, and knowledge

Vannevar Bush (Library of Congress)

of the military establishment, Bush masterfully led and defended OSRD during challenging and often chaotic times. The impressive number of major wartime inventions (radar, radio-inertial navigation, amphibious vehicles, the proximity fuse, penicillin, and of course the ATOMIC BOMB, to cite just a few) that issued from OSRD-sponsored research crowned Bush's already substantial reputation.

Bush's July 1945 report, *Science: The Endless Frontier*, became the blueprint for instituting what some scholars have called the "permanent mobilization" of science and technology for the cold war, and has been reprinted and studied continuously since, often forming the starting point for periodic review of the subject by government. Bush also arranged for an extensive history of OSRD to be written and published in a series of popular books—and proved to be as masterful in crafting and controlling the remembrance of OSRD as he was in building and operating it in the first place.

Bush believed that it was the peculiarly American democratic character and institutions that made science and technology successful in the United States and correspondingly hindered it in totalitarian states. He therefore wished to dismantle the OSRD as quickly as possible, viewing it as an effective but undemocratic emergency measure for the war effort. In its place he envisioned a National Research Foundation that would support science and technology with public money, but place funding decisions and accountability in the meritocracy of science and technology leadership rather than in a government body. The National Science Foundation was established by President Harry S. Truman in 1950, one of a number of postwar government agencies with responsibilities for science and technology.

## business

Few business enterprises, small or large, fully escaped the consequences of the GREAT DEPRESSION of the 1930s. Between 1929 and 1933, industrial production was halved and UNEMPLOYMENT soared from three percent to 25 percent. In these four years, 110,000 businesses failed and more than 5,000 banks went under. For many businesses that survived the initial collapse of the ECONOMY, the problems of these early years of the depression—reduced markets and low profits—dragged on for the rest of the 1930s. General conditions only improved following the increased

demand brought about by GOVERNMENT spending for military preparedness in Europe and the United States in the late 1930s, and then for MOBILIZATION for WORLD WAR II in the early 1940s. World War II then had important consequences for business.

Nevertheless, during the depression and war, experiences varied among businesses in different industries and sectors. Generally, larger businesses did better than smaller, manufacturing suffered less than BANKING and finance, consumer goods manufacturers performed better than makers of capital goods. The country's biggest businesses—those among the 100 largest industrial enterprises in the country in terms of employees, total assets, and gross receipts—probably did best. There were no bankruptcies within this group, although most initially faced reduced sales, profits, and dividends. The biggest enterprises were apt to be in oligopolistic industries—such as the AUTOMOBILE INDUSTRY, the STEEL INDUSTRY, chemicals, and electrical products—where the few firms in an industry had the market power and financial reserves to stay in business despite the difficult times. They cut back on operations, reduced workforces, repositioned resources, and concentrated on producing those products for which markets still existed. General Motors, for example, experienced a 75 percent drop in sales between 1929 and 1933. Sales declined precipitously for the company's most inexpensive vehicles, so GM focused on its more expensive lines of automobiles designed for the middle and upper classes.

Among the largest companies, managers took advantage of low LABOR, material, and equipment costs. Some stockpiled raw materials, upgraded equipment, repaired idle plant, and invested in improving manufacturing processes. Firms with established research laboratories—General Electric, AT&T, DuPont, Alcoa, General Motors, RCA, Merck & Co., Eli Lilly, Standard Oil of New Jersey, Shell Oil—were able to hire large numbers of engineers and scientists with advanced degrees because of the low wages for university graduates. Such highly trained personnel also found jobs in industries such as glass making and food processing, where they had not been so well represented before.

Managers also embraced strategies of product diversification that moved businesses into new markets. A long-term consequence of diversification and larger research and development (R and D) operations was that many enterprises were well positioned to meet the needs of the World War II economy. During the war, many firms proved adept at moving far afield from their accustomed markets. Workers at the consumer products company Procter & Gamble, for example, filled almost 25 percent of the country's artillery shells with explosives. Stepped up R and D in the 1930s led Alcoa to develop several alloys later widely used in military aircraft. Similarly, advances in

petroleum refining TECHNOLOGY prepared the industry to meet increased wartime demands for petroleum products, including high-octane aviation fuel.

Small businesses—defined as firms employing fewer than 100 workers—experienced the depression very differently. Historically, such enterprises had faced a precarious existence, enduring high rates of failure. The depression years were no exception. Even so, there was an increase in the numbers of small businesses formed during the 1930s. In the retail sector, there were almost 1.8 million stores in 1939, an increase of 300,000 from 1929. But most of these new enterprises were products of the troubled times, small operations in labor intensive, service-oriented businesses. Unemployed workers turned to small-scale, low capital retailing to eke out some kind of a living.

In contrast, larger businesses producing consumer goods fared best during the depression. Consumption spending (in “constant” dollars corrected for the deflation of the early depression) declined only about 20 percent between 1928 and 1932, whereas investment fell nearly 90 percent. Consequently, consumer goods manufacturers were apt to be more “depression proof” than those engaged in producing machinery and equipment. Households continued to purchase everyday items (groceries, beverages, cigarettes, soaps, medicines, detergents, personal hygiene products, work clothes, newspapers, magazines). Moreover, while most families could not afford new automobiles or new homes, they needed to fuel and service the cars, and maintain and repair the houses, they already had. Thus, sales of petroleum products, automobile parts, and tires remained strong. By 1936, for example, petroleum sales exceeded those of 1929. New home building plummeted during the depression, making the HOUSING construction sector one of the most troubled of the decade, along with AGRICULTURE and mining. Those already owning homes, though, continued to make improvements. In 1930, for example, only 51 percent of homes had flush toilets; by 1940 the proportion was 60 percent.

Further belying the general view that the 1930s were a period of unrelieved doom for business were examples of new companies that achieved later success. Entrepreneurs established companies in the 1930s that were destined to become household names to a later generation: Hewlett-Packard, Polaroid Camera, Texas Instruments, and Ryder Truck. Fledgling companies established earlier also took off in the 1930s. Because the SOCIAL SECURITY ACT of 1935 meant that the federal government needed to keep information about almost every wage earner, for example, IBM’s electromechanical punchcard equipment gave the company a new market and positioned it for even more rapid growth during the war and postwar periods.

The 1930s were also a period of important business innovations with far-reaching consequences for Ameri-

can life. New firms emerged, and established businesses grew, in industries that commercialized new technology, products, and services. Developments in industries related to aviation, supported in part by federal funding for their military applications, led to improvements in avionics, aircraft engines, aviation fuel, and aluminum alloys. These advances proved vital to the United States’s capabilities in fighting World War II. Commercial RADIO broadcasting, and the growth of the MOVIES, structured a mass entertainment industry with profound long-run consequences, both good and ill, in creating a more national, less regional, American POPULAR CULTURE. Chemical and petroleum companies engaged in research focused on carbon (found in petroleum), which served as the basis for the making of numerous synthetic materials. The most famous result of these efforts was DuPont’s commercialization of nylon, first created in 1934. Such work on polymers (the building blocks of this chemical revolution) in the 1930s paid off in the war years with the production of many new materials, including synthetic RUBBER.

The retail sector also saw innovations in the 1930s. A particularly vibrant area of growth was in gasoline service stations, funded in part by the major petroleum companies to spur on retail sales of gasoline. Chain grocery stores (which had over a third of the market for grocery sales in 1933) continued to grow during the 1930s, as did supermarkets, stores that sold a larger number and variety of goods than the chain stores. Between 1935 and 1939, the number of supermarkets increased from about 300 to almost 5,000.

Advances in grocery chain and supermarket retailing resulted from innovations in the food processing industry. Major food processing companies, such as General Foods and General Mills, invested heavily in improving processing, packaging, and distribution, and launched heavily advertised new products and product lines. The industry, for example, introduced pasteurized fruit juices and individually packaged baked goods. In adding zinc to can coatings, food processors made canned goods safer. By 1939, the output of these products had doubled from the 160 million units produced in 1931. Progress in bottling soft drinks, along with innovations in vending machines, increased the market for a growing variety of these popular products. General Foods Corporation introduced frozen foods in the 1930s, although it was not until after World War II that household refrigerators had freezers able to store such products safely.

Business also had to face up to the growing presence of the federal government in the economy during the 1930s. NEW DEAL legislation fundamentally altered the structure and behavior of key industries by creating new independent regulatory agencies or granting increased authority to already established government departments. Industries

affected included banking, securities, telephone, aviation, railroads, broadcasting, electric power, petroleum, lumber, mining, and agriculture. These changes affected businesses differently, and generated differing responses from business leaders, many of them hostile to the New Deal, but others more supportive. Perhaps the most significant piece of legislation from a general business point of view was the 1935 NATIONAL LABOR RELATIONS ACT. By conferring on workers a right to organize unions, the New Deal altered the fundamental relationship between workers and owners/managers. LABOR relations became for many businesses one of the most contentious matters of the time, an issue that for many firms lasted well into the postwar years.

World War II had a profound impact on American business. Wartime government spending of more than \$300 billion to finance mobilization ended the depression. This sum was 10 times greater than that expended on World War I. Indeed, it was about double what the federal government had spent in its entire history. The rapid economic turnaround provided a robust stimulus to employment, sales, and business profits. But, as with the depression, the consequences of the war for businesses varied among industries and economic sectors. The requirements of a government geared to total war had a greater positive impact on the largest enterprises than the smallest. Federal officials needed the expertise of mass production manufacturers to produce great quantities of war materials, and businessmen often played key roles in mobilization agencies. Government also employed the research and development skills of the largest businesses, enterprises capable of developing and producing highly sophisticated, technologically advanced products and weapons.

A high level of collaboration with technologically advanced companies continued into the cold war years, forming what became known as the military-industrial-university complex. Government-business cooperation during World War II was closest in munitions, aviation, electronics, metals, chemicals, and nuclear power. The most famous collaboration occurred in the MANHATTAN PROJECT that produced the ATOMIC BOMB. Perhaps less well known was the government's enlisting the pharmaceutical companies in a crash program to produce large quantities of penicillin to reduce combat deaths attributable to infection.

New technologies emerging from World War II had long-lasting effects on American business. In the postwar decades, many of the largest companies commercialized the new technologies. Wartime advances in aviation, nuclear power, radar, jet propulsion, antibiotics, synthetic materials, and computers eventually all found their way into products for industry and households. World War II also solidified the position of big business in the American economy. During the war, over half of the government's \$175 billion in prime defense contracts went to 33 compa-

nies. While many of them subcontracted work to smaller enterprises, about three-quarters of subcontracts went to enterprises employing more than 500 employees. Businesses employing more than 10,000 people increased their share of industrial employment from 13 to 30 percent between 1939 and 1944. Small businesses, employing 100 or fewer people, dropped from 26 to 19 percent of industrial employment in the same years. These trends toward industrial concentration were to continue in the postwar period.

The Great Depression and World War II thus had important consequences for American business. Few enterprises escaped the problems created by the collapse in 1929 or the effects of the U.S. involvement in World War II, and all had to deal with a federal government that had vastly increased powers because of the New Deal and wartime mobilization. This new environment often created problems for the owners of small firms, as well as for the managers of giant enterprises. But economic collapse and a wartime economy also prompted among the largest businesses a greater commitment to developing and commercializing technology, and to diversifying their operations. Smaller businesses had a more difficult time adjusting to the economic changes and challenges, but some also found opportunity in these years—especially during the war—by supplying goods and services to government and big business.

From the perspective of more than half a century, the business losses, failures, and disruption of the depression and war provide only part of the story. The 1930s were also a time of innovation and experiment that prepared business to meet the demands of a global war. And World War II also positioned business, mainly large enterprises, to meet the government's needs in the cold war and to take advantage of the boom times that followed the most destructive war in history.

**Byrnes, James F.** (1882–1972) *U.S. senator, associate justice of the Supreme Court, secretary of state*

As a United States senator from South Carolina, SUPREME COURT justice, wartime administrator, and secretary of state, James F. Byrnes was one of the most influential political figures of the 1929–45 period. Byrnes, who earned a reputation as sly and able, was perhaps the most important southern politician between John C. Calhoun and Lyndon B. Johnson.

James Francis Byrnes was born on May 2, 1882, in Charleston, South Carolina, seven weeks after his civil servant father died of tuberculosis. Though he dropped out of school at age 14 to help support his mother and sister, Byrnes was an ambitious young man who received his education in law and politics by running errands for a prominent Charleston attorney and working as a court stenographer.

By 1910, Byrnes had settled in Aiken, South Carolina, married (converting from the Roman Catholic to the Episcopal Church), and become a successful attorney and prosecutor. He was elected that year, at age 28, to the U.S. House of Representatives, where he would serve for 14 years. As a congressman, Byrnes gained several patrons important to his political career, including BERNARD M. BARUCH, the financier and DEMOCRATIC PARTY insider who owned a South Carolina estate, and FRANKLIN D. ROOSEVELT, who met Byrnes while assistant secretary of the navy. Byrnes ran unsuccessfully for the U.S. Senate in 1924, his refusal to join the Ku Klux Klan being a factor in his defeat, and returned to Aiken to practice law.

In 1930, Byrnes was elected to the U.S. Senate, and immediately became an important figure in Washington. He was an early supporter of Roosevelt's presidential candidacy in 1932, and served as consultant and sometimes speechwriter during the campaign. After Roosevelt's election, Byrnes was a staunch supporter of the NEW DEAL, helping to draft some legislation and to shepherd through CONGRESS such measures as the AGRICULTURAL ADJUSTMENT ACT, the NATIONAL INDUSTRIAL RECOVERY ACT, the CIVILIAN CONSERVATION CORPS, and the FEDERAL EMERGENCY RELIEF ADMINISTRATION. During the SECOND NEW DEAL of 1935, Byrnes helped win passage of the NATIONAL LABOR RELATIONS ACT despite his links to South Carolina textile interests and his growing antipathy toward organized LABOR.

In 1936, Byrnes easily won reelection to the Senate, defeating an opponent in the Democratic primary who attempted to tie the New Deal and Roosevelt to racial equality. Byrnes emphasized economic issues and how

the New Deal benefited all—especially white—South Carolinians. After Roosevelt's reelection in 1936, Byrnes backed the president's COURT-PACKING PLAN, but broke with FDR on labor issues, including sit-down strikes by the CONGRESS OF INDUSTRIAL ORGANIZATIONS. Byrnes also opposed Roosevelt's attempted "purge" of anti-New Deal Democrats (including his South Carolina colleague "Cotton Ed" Smith) in 1938, but he remained on friendly terms personally with the president. He worked against CIVIL RIGHTS for AFRICAN AMERICANS and helped defeat ANTI-LYNCHING LEGISLATION.

Although ambitious for the presidency himself, Byrnes backed Roosevelt for a third term in the ELECTION OF 1940, but was disappointed when he was passed over for the vice presidency, due to opposition from labor and northern liberals. In 1941, Roosevelt appointed Byrnes to the Supreme Court, but the South Carolinian found the job too constraining. After the American entry into WORLD WAR II, Byrnes resigned from the Court in 1942 to direct the Office of Economic Stabilization. A year later, Roosevelt named Byrnes to head the OFFICE OF WAR MOBILIZATION, a position so important that he had an office in the White House East Wing, and became known as the "assistant president."

In 1944, Byrnes was again passed over for the vice presidency, and again Roosevelt placated his old friend, this time by having him accompany the president to the YALTA CONFERENCE in February 1945. Rumors persisted that Roosevelt would name Byrnes as either secretary of state or UNITED NATIONS ambassador. After Roosevelt died in April 1945, the new president, Harry S. Truman, a former Senate colleague, named Byrnes secretary of state. Byrnes served in that position until 1947, when personal and philosophical differences with Truman, and growing disillusionment with the Democratic Party on labor and racial issues, led to his resignation.

In 1950, Byrnes was elected governor of South Carolina on a conservative, segregationist platform; he served one term. In 1952, although still nominally a Democrat, he made little secret of his preference for Republican Dwight D. Eisenhower in the presidential race. Byrnes lived out his final years in South Carolina as a wayward Democrat who in 1968 endorsed Richard M. Nixon for president. James F. Byrnes died in Key West, Florida, on April 9, 1972.

—William J. Thompson

### **Cairo Conference** (November 1943)

The Cairo Conference, involving the United States, Great Britain, and China, was held in late November 1943 to discuss strategy and objectives for the Far Eastern arena of the PACIFIC THEATER of WORLD WAR II.

American president FRANKLIN D. ROOSEVELT and British prime minister Winston Churchill scheduled this conference to take place before they met with Soviet leader Joseph Stalin at the TEHERAN CONFERENCE, which would focus on Allied strategy in Europe. Originally Roosevelt had planned to meet only with Stalin at Teheran; however, Churchill insisted that he attend the Teheran Conference and also that he and Roosevelt meet beforehand at Cairo, Egypt, to coordinate their approach to the Teheran meeting and decisions about Europe. Roosevelt suggested that the Soviets and Chinese join the Cairo Conference and discuss Allied strategy in the Pacific. China agreed, but the Soviets demurred, preferring not to meet with the Chinese because of the Soviet nonaggression pact with Japan.

Roosevelt intended that the Cairo Conference focus especially on discussions with Chinese leader Jiang Jieshi (Chiang Kai-shek) about the war in Asia. Besides wanting to keep China in the war, Roosevelt thought China should be added to the “Big Three” (the United States, Soviet Union, and Britain) and as one of the major powers should have a significant voice in wartime and postwar policies. Roosevelt also attempted to get Churchill to pledge postwar independence to Britain’s Asian colonies, as the United States had for the PHILIPPINES. Churchill tried unsuccessfully to ignore Jiang, whom he considered unimportant, and to pressure Roosevelt into agreeing upon a united diplomatic front to present to the Soviets at Teheran.

Despite tensions between Roosevelt and Churchill, the Cairo Conference did come to some agreements about the Pacific war before the two men flew on to their meeting with Stalin at Teheran. The conferees decided that Japan would be stripped of territorial gains it had made since World War I and would return to China territory taken

before and during the war, and they agreed that the Allies would require an unconditional surrender from Japan. These points, along with other decisions, were made public in December in the Cairo Declaration. Roosevelt also promised Jiang and his Nationalist Chinese forces continued assistance, including LEND-LEASE Act aid and American support of an attack on Burma, although he came to the conclusion previously reached by others that Jiang was a weak and indecisive leader.

Roosevelt and Churchill met again less formally at Cairo in early December 1943, just after the Teheran Conference, in what is sometimes known as the Second Cairo Conference. Here they unsuccessfully tried to coax neutral Turkey into the war on the Allied side, and decided to delay the Burma offensive in order to shift needed resources into the cross-Channel invasion of France set at Teheran for the spring of 1944.

### **Capra, Frank** (1897–1991) *motion picture director*

Frank Capra was perhaps the most famous motion picture director of the 1930s and 1940s. His celebration of democracy and the common man permeated his most important Hollywood MOVIES of the 1930s as well as his *Why We Fight* films of WORLD WAR II, produced in collaboration with the U.S. GOVERNMENT. Capra’s focus on the dignity and decency of ordinary people reflected not only his own views but also themes often found elsewhere in the ART,

## 62 Casablanca Conference

PHOTOGRAPHY, LITERATURE, and POPULAR CULTURE of the GREAT DEPRESSION.

Capra himself lived a version of the American dream after his family moved to the United States from Sicily when he was six years old. Working his way through college, Capra earned a degree in engineering before beginning his career in Hollywood. His 1934 comedy, *It Happened One Night*, won five Academy Awards, including both best picture and best director. Capra's celebration of American democracy and the American dream shaped his subsequent films of the 1930s, especially *Mr. Deeds Goes to Town* (1936) and *Mr. Smith Goes to Washington* (1939). Deeds, after inheriting a fortune and moving to the city, gives his money away and returns to his small-town home, disillusioned by greed and the power of money. Smith, a newly elected senator, sees the corruption of money and power in the U.S. Senate when he arrives in Washington and fights to expose it and return to the democratic ideal.

In 1941 Capra joined the U.S. ARMY Signal Corps and was asked by the War Department to create a series of films explaining the significance of the war and depicting the dangers of fascism and Nazism. Though much different in format from Capra's fictional Hollywood movies and really part of the government's wartime PROPAGANDA effort, the seven-film *Why We Fight* series also expressed his strong patriotism and his belief in the ideal of democratic government and the strength of ordinary people. The films were shown to soldiers going overseas to impress upon them the meaning of the war. The first film in the series was also released for general distribution and, while faring poorly at the box office, won a 1942 Academy Award.

After the war, Capra continued to make films designed to celebrate American values and inspire optimism in his audiences. His most famous work, *It's a Wonderful Life* (1946) is now considered to be the peak of Capra's career, though it was not a commercial success. By the 1950s and 1960s, audiences and their tastes changed, and Capra's films became relics of an older generation.

### Casablanca Conference (January 1943)

With victory near in the NORTH AFRICAN CAMPAIGN by early 1943, a meeting of the Allied leaders seemed desirable to discuss the next steps to be taken against the AXIS powers in the EUROPEAN THEATER of WORLD WAR II. President FRANKLIN D. ROOSEVELT wanted the conference to include Soviet premier Joseph Stalin, but Stalin insisted that the military situation in the Soviet Union was

U.S. general George S. Patton, Jr., was military host of the Casablanca Conference. He is shown here with President Franklin D. Roosevelt at Casablanca on January 17, 1943. (Patton Museum of Cavalry and Armor, Fort Knox, Kentucky)

too delicate for him to leave. British prime minister Winston Churchill and Roosevelt then decided to meet in the small seaside city of Casablanca in North Africa.

Roosevelt, Churchill, and their staffs met from January 13 to 23, 1943. Much of the conference was given over to debate between the British military, which wanted next to invade SICILY, and the smaller and less well-prepared American military contingent, which wanted to launch a cross-Channel invasion of German-occupied France as soon as possible and thus open a true SECOND FRONT in Europe. The joint communiqué of January 23 indicated that Sicily was to be the next target for the Allies and said that the BATTLE OF THE ATLANTIC would be given top priority in order to end the German U-boat threat to Allied shipping. Roosevelt and Churchill also pledged to fulfill LEND-LEASE Act agreements with the Soviet Union and to launch the round-the-clock Combined Bomber Offensive against Germany. They agreed to put 30 percent of the American total war effort to operations in the PACIFIC THEATER, thus allowing the U.S. NAVY to remain on the offensive against the Japanese.

Roosevelt and Churchill understood that Stalin would be angry about the decision not to open the second front by a cross-Channel invasion of France that would relieve German pressure on the Soviet Union. To help ease Stalin's suspicions after his inability to deliver the cross-Channel invasion, and after agreement to the negotiated surrender of Vichy French forces in North Africa, President Roosevelt announced at a January 24 press conference that the Allied powers would accept nothing less than unconditional surrender from the Axis powers. This doctrine of unconditional surrender was enunciated chiefly to reassure Stalin

and solidify the GRAND ALLIANCE and SOVIET-AMERICAN RELATIONS. Aiming also to prevent a future German leader from claiming, as Hitler had, that civilian leadership had “sold out” the military, it committed the Allied powers to totally defeat the Axis powers, possibly extending the duration and cost of the war.

### cash-and-carry

As global tensions increased in the 1930s, CONGRESS enacted a series of NEUTRALITY ACTS between 1935 and 1941 aimed at preventing the United States from entering war again as it had during World War I. To maintain American neutrality, yet permit sales of raw materials and other nonmilitary goods that might help the U.S. ECONOMY, a “cash-and-carry” provision was included in the 1937 Neutrality Act. It permitted nations at war to buy nonmilitary goods from the United States if paid for in advance by cash and carried away on ships not under United States registry. The cash-and-carry provision was set to expire in two years.

By the beginning of WORLD WAR II in 1939, cash-and-carry, like the Neutrality Acts generally, fit uncomfortably with the growing anti-AXIS sentiment in the United States. In the Atlantic, cash-and-carry helped Britain and France, which had significant trade contacts with the United States as well as ample shipping. In the Pacific conflict between China and Japan, however, the cash-and-carry principle favored Japan, with its shipping capacity and trade with the United States. And even for Britain and France the requirements of cash-and-carry had the potential to limit the acquisition of needed materials.

The Neutrality Acts had imposed an embargo on military items to nations at war, and these goods were also included under cash-and-carry after the beginning of the war in Europe in September 1939. Over the objections of ISOLATIONISTS, pro-Allied interventionists helped President FRANKLIN D. ROOSEVELT eliminate the arms embargo from the Neutrality Act of November 1939. Those opposed to intervention succeeded, however, in renewing cash-and-carry, which had expired in the spring and which now applied to the sale of military as well as nonmilitary items. The new legislation also continued the ban on loans to nations at war.

By late 1940, England was no longer able to pay cash for the war materials and other goods it needed. The BATTLE OF THE ATLANTIC, moreover, was reducing British

shipping at an alarming rate. In his annual address to Congress, on January 6, 1941, Roosevelt announced that he was sending LEND-LEASE legislation to Congress for action, so that England could acquire the materials it needed for its defense. Passage of the Lend-Lease Act removed the cash requirement of cash-and-carry, and the subsequent Neutrality Act of November 1941 allowed American ships to carry cargo to nations at war.

### Catholics

Throughout the era of the GREAT DEPRESSION and WORLD WAR II, the United States GOVERNMENT restricted IMMIGRATION in accordance with legislation of the 1920s. But previous Roman Catholic immigration, especially to larger CITIES, laid the foundation for such Catholic groups as IRISH AMERICANS, ITALIAN AMERICANS, and POLISH AMERICANS to become religious, social, and political forces in American life. Although the Roman Catholic Al Smith’s failed presidential run in 1928 exposed persistent strands of anti-Catholic nativism in America, ethnic Catholics would become key components in the political success of the NEW DEAL programs of President FRANKLIN D. ROOSEVELT in the 1930s and beyond. By far the largest religious group in the United States, Catholics generally became more “respectable” and accepted from 1929 to 1945, particularly in urban areas. They did so in part through devout juxtapositioning of traditional social concerns, which played directly into New Deal objectives, and staunchly antitotalitarianism sentiments (especially anticommunist), which were completely synchronized with existing American conservatism.

Roman Catholic lay people played an increasingly large role in American life in the era. JAMES A. FARLEY and EDWARD J. FLYNN served as chairmen of the DEMOCRATIC PARTY National Committee and as important political advisers to President Roosevelt, and other Catholics held important offices in federal, state, and local government. JOSEPH P. KENNEDY served as the first head of the SECURITIES AND EXCHANGE COMMISSION and as ambassador to Great Britain. Partly because of the unprecedented number of Catholics appointed to government positions by Roosevelt, though especially because of New Deal programs that helped the heavily working-class Catholic population, Catholic voters were a key part of the new Democratic majority forged in the elections of the 1930s. To many practicing church members, it appeared the

president was answering the call set out in Pope Pius XI's encyclical *Quadragesimo Anno* (1937), which called for social justice around the world and for all Catholics to work to that desired end. In 1940 Roosevelt further cemented his allegiance to Catholics by appointing Cardinal Francis Spellman of New York as his unofficial envoy to the Vatican in Rome, despite vocal protests mounted by several Protestant denominations. Thus the Catholic hierarchy was generally supportive of the New Deal and its goals, while church members engaged in levels of social and political activism that were unthinkable a generation earlier. Catholics also figured prominently in such diverse areas as LABOR, LITERATURE, and SPORTS.

Roman Catholics began to effectively utilize mass media, especially the RADIO. For instance, the popular bishop Fulton J. Sheen possessed keen intellectual abilities, but became known as a great preacher and orator who could connect personally and spiritually with the general American public. Later a television personality, Sheen is often credited with being a key founder of the so-called electronic church in America. A far more controversial Roman Catholic broadcaster was Father CHARLES E. COUGHLIN, who became as much known for his political and social commentary as for his purely doctrinal messages. His fierce anticommunist stances quickly became mixed with overtly anti-Semitic diatribes and global conspiracy theories. Coughlin opposed Franklin Roosevelt, the New Deal, and American involvement in World War II, as well as displaying pro-Nazi sympathies—and the church brought about an end to his public pronouncements.

Another notable Catholic figure of the era was Archbishop (later, Cardinal) Francis Joseph Spellman, who was simultaneously an ardent anticommunist, archbishop of New York, and diplomatic representative of Pope Pius XII during World War II. Serving as U.S. military vicar and unofficial envoy for Franklin Roosevelt during wartime, Spellman was also involved in promoting conservative social positions on such issues as birth control, movie CENSORSHIP, and the relationship between government funding and private EDUCATION.

Whereas the Catholic clergy was more or less uniformly conservative in its approach to communism and many social issues, the laity proved somewhat more diverse, often embracing LIBERALISM and containing some radical elements. Such women as Dorothy Day, who was a founding figure in the Catholic Worker movement, became active in the public arena. A pacifist, Day surprisingly had converted to Roman Catholicism from a secular, socialist past, and she pursued radical social and political change through the church. Another influential Roman Catholic figure of the period was Father John A. Ryan. Trained in political and economic theory, Ryan served as director of the Social Action Department of the influential National

Catholic Welfare Council. He was a fierce critic of the economic policies of President HERBERT C. HOOVER and one of Franklin Roosevelt's staunchest New Deal supporters. Ryan became a key figure in forging a progressive social and political image for the 20th-century Catholic Church in America.

The period also witnessed a developing focus upon issues involving AFRICAN AMERICANS, as demonstrated by the urban missionary priest William McCann in Harlem, and the Jesuit priest William Markoe in St. Louis, who functioned as a type of proto-CIVIL RIGHTS spokesman there. While Roman Catholicism did not generally appeal to African Americans, emerging groups like the Federation of Colored Catholics demonstrated that African American Catholics were attempting to shape the religious, political, and social debates of a stormy era. The Jesuit priest John LaFarge helped establish the Catholic Interracial Council in 1934, and by the 1940s, local chapters were located in cities throughout the North and SOUTH, thus providing key lay and clerical support for the future Civil Rights movement of the 1950s and beyond.

Where Roosevelt failed to gather strong Catholic support in the 1930s was in the realm of international relations. His recognition of the Soviet Union in 1933, for example, angered Catholics, who were averse to rising totalitarianism in Europe and the persecution of the church in Mexico and Spain. This position, however, radically changed with the outbreak of war in 1941. World War II saw Catholics patriotically supporting the war effort, further reinforcing their sociocultural legitimacy, though they were still perceived as "ethnics" by the broader Anglo-American culture. While continuing to hold important government positions, Catholics also served in large numbers in the U.S. military and constituted a significant part of the labor force in the defense industry. By the end of the war, MEXICAN-AMERICAN Catholic immigrants were moving in substantial numbers into already Hispanic areas of the American Southwest, especially around Los Angeles. These Hispanic Catholics imported a unique style of Catholicism, which often led to hostilities with already established Catholic communities.

From the depression to the end of World War II, Catholics continued to influence the evolving face of urban environments in America. At the grassroots level, Catholic laypeople displayed increased interest in Marian devotion and neighborhood festivals. Dynamic priests at the parish level often functioned as much as social and economic spokesmen and activists as they did as purely spiritual leaders. The period also marked Catholicism's rapid transition into the national mainstream, both politically and culturally, a remarkable occurrence considering the traditional Protestant domination of both spheres and their traditional antipathy toward Catholics and their church.

## censorship

Censorship is the prior review of all forms of expression in order to suppress or restrain, in part or entirely, anything considered objectionable. The era of the GREAT DEPRESSION and WORLD WAR II was marked by a number of efforts by the GOVERNMENT and by private organizations to censor objectionable speech, publications, and other forms of expression. The period also brought some state and federal court rulings that overturned or eased censorship laws and practices. During World War II, government censorship, while extensive and pervasive, was nonetheless less onerous than during World War I.

In the first part of the 20th century, censorship clashed with the prohibition in the First Amendment of the Constitution of laws abridging the freedom of speech or of the press. During World War I, for example, the Espionage Act and the Sedition Act sharply restricted opposition to the war or criticism of the government, and in 1919 the SUPREME COURT upheld such censorship in *Abrams v. the United States*. In 1925, the Supreme Court (*Gitlow v. New York*) ruled that even speeches that posed no immediate danger to public order could be punished. The 1930 HAWLEY-SMOOT TARIFF ACT prohibited the import of anything immoral or obscene.

New forms of expression, such as MOVIES and RADIO encountered censorship during this period. Following several scandals, the Motion Picture Association of America adopted a strict code for the film industry in the 1920s to head off government censorship. Private groups, notably the Roman Catholic Legion of Decency, had their own film rating system, lobbied against a number of movies, and contributed to the film industry strengthening its self-censorship with the Production Code Administration, established in 1934. Many states and municipality censorship boards banned totally, or in part, a number of films. Such actions did not apply only to obscenity or “immoral” behavior, but also to portrayals of violence, crime, and social problems. The Chicago Board of Censors refused to allow the show-

ing of a 1937 Paramount newsreel of the Republic Steel Memorial Day Massacre, for example, while a Memphis board blocked a film showing black and white children going to school together.

Because radio stations were licensed, strict government controls could be enforced on this medium. Programs considered inflammatory or immoral, such as those of FATHER CHARLES E. COUGHLIN and Mae West were reviewed by the FEDERAL COMMUNICATIONS COMMISSION or canceled by the radio stations. Radio and film self-censorship came partly for economic reasons. Since so many Americans attended movies or listened to the radio, continued income from admissions and ADVERTISING depended upon the widest possible audience appeal. Controversial programs or films would reduce industry profitability.

During the 1930s and 1940s, court decisions overturned some censorship laws and practices. In 1931, the Supreme Court (*Near v. Minnesota ex rel. Olson*) ruled that a Minnesota statute preventing the publication of “scandalous and malicious” material was an unconstitutional prior restraint of the press. In 1934, a New York federal judge lifted the ban on James Joyce’s *Ulysses*, seized under the Hawley-Smoot Tariff Act, although other courts upheld bans of the novels *Tropic of Cancer* (1934) by Henry Miller and *Lady Chatterley’s Lover* (1944) by D. H. Lawrence. The Supreme Court also struck down a Georgia law prohibiting speeches by COMMUNISTS (1937).

The approach of World War II caused the U.S. government to take actions to ensure domestic security and to protect military secrets. The U.S. ARMY and U.S. NAVY began planning for censorship by the late 1930s, and during the war censored communications and also correspondence of armed forces personnel. In 1940, CONGRESS passed the SMITH ACT, which among other things outlawed advocating the overthrow of the government and authorized deporting aliens who belonged to revolutionary organizations or expressed revolutionary sentiments.

On December 19, 1941, President FRANKLIN D. ROOSEVELT issued Executive Order 8985 creating the federal Office of Censorship under Associated Press editor Byron Price. The office eventually grew to 90 offices across the country staffed by more than 14,000 examiners who scanned radio and movie scripts, magazine and newspapers stories, listened to telephone conversations, monitored radio broadcasts, checked for invisible inks, banned crossword puzzles, and reviewed more than a million overseas letters a day. Letters marked with the sticker *Opened by Censor* became a common sight during the war.

While primarily meant to protect wartime secrets and uncover ESPIONAGE, censorship also shaped how Americans perceived the war and served PROPAGANDA purposes. Censors restricted the publication of brutal images of the

war and problems on the domestic front. Not until 1943 were photos of dead Americans released for publication; before then, such images were thought harmful to morale, but as the Allies clearly gained the upper hand, the government wanted to avoid home-front overconfidence. The armed forces censored their own photographers and filmmakers—and used their products for public relations purposes. The OFFICE OF WAR INFORMATION and its BUREAU OF MOTION PICTURES ensured that the content of Hollywood films during the war fit with the administration's war aims through appeals to patriotism and threats to restrict distribution. Like war reporters and photographers, filmmakers cooperated with government wishes.

Still, whatever the tensions with First Amendment rights, wartime censorship never seemed excessive, especially in comparison with the other nations at war or with the World War I home front. In part this was due to the unwillingness of many leaders, especially President Roosevelt, to repeat the excesses of World War I. Only two cases were brought to trial during the war under the Smith Act. Moreover, Byron Price exercised his power with restraint, while American journalists adhered to a system of self-censorship. The Office of Censorship was terminated at the end of the war.

## children

The dramatic events engaging Americans from 1929 to 1945 deeply shaped the lives of children, and young people made their own important contributions to the American experience during these significant years. Together with demographic shifts and other POPULATION TRENDS, these events also contributed to growing debates about the role of public policy for children and their families.

The census of 1930 showed the median age of Americans as 26.4 and counted approximately 24 million individuals of less than 20 years of age. This significant group constituted 38 percent of the total population. Although

the numbers suggest that America's youngest citizens were statistically important, the 1930 census also revealed that children and adolescents comprised a shrinking proportion of the total U.S. population. One hundred years earlier, people under 20 made up a majority of the total population (56 percent), and the country's median age was only 17.2. Over the next century, life expectancy lengthened and families became smaller, thereby reducing children's share of the total population.

Despite the fact that young people were a smaller part of the total, by the 1930s and 1940s social policies directed at children combined with a revised cultural definition of childhood to bring positive changes for America's youngest citizens. Beginning in the mid-19th century Americans moved toward a new middle-class definition of childhood and adolescence that was firmly grounded in law and culture by the 1930s and 1940s. In this new formulation, the average family (4.3 members) was approximately half of what it had been in 1830. Smaller families allowed parents to focus more attention on their offspring. Health care improved and overall life expectancy lengthened. A declining number of youngsters worked for wages and children spent more years in school. Compulsory school attendance fostered age segregation that increased the influence of peer groups and the development of a separate youth culture.

The GREAT DEPRESSION and WORLD WAR II then presented different but difficult hurdles for America's youngest citizens and produced ambivalence among adults toward expanded public policies for young people in the postwar years. As the U.S. Children's Bureau noted in its 1933 report, the onset of the Great Depression often hit children the hardest. One-third of Americans were ill-housed, ill-clothed, and ill-fed—and of those, the majority were children. In addition, young people eligible to work found it very difficult to get a job. Americans 16 to 20 years of age had UNEMPLOYMENT rates twice those of adults, and an estimated 23,000 homeless teens rode the nation's railways and hitchhiked along its highways looking for work.

Several NEW DEAL programs sought to help young people. The CIVILIAN CONSERVATION CORPS, a work RELIEF program open to males 16 through 23 years of age, but closed to females, provided jobs for unemployed young men. The NATIONAL YOUTH ADMINISTRATION offered part-time jobs and tuition assistance to help young people remain in high school and college (and off the job market). The NYA included a division focused on the needs of young AFRICAN AMERICANS, a foreshadowing of postwar efforts to end racial inequality.

New Deal policymakers also took advantage of the fact that the economic crisis of the 1930s eroded opposition to federal legislation to regulate child labor and increased pressure on the government to keep young people under

eighteen out of the paid LABOR force. Child labor regulations of the NATIONAL RECOVERY ADMINISTRATION (NRA) immediately removed 150,000 young workers from payrolls. After the NRA was declared unconstitutional in 1935, child labor provisions of the 1938 FAIR LABOR STANDARDS ACT outlawed the employment of individuals under 16 in the manufacture of materials shipped across state lines. The law also regulated the hiring of young people aged 16 and 17, although AGRICULTURE and domestic service were exempted from the law. The new legislation did not end the exploitation of all young workers, but it combined with the decade's labor crisis and existing compulsory school attendance laws to force the vast majority of individuals under 18 years of age out of the wage-labor market and into school.

During the 1930s, even Hollywood MOVIES reflected the new social status of children based on the middle-class model emphasizing EDUCATION. Films featuring the "Our Gang" kids, and child stars such as Mickey Rooney, Judy Garland, and Shirley Temple idealized childhood and adolescence as a time of schooling and fun absent from adult responsibilities. For the first time in American history a majority of 17-year-olds attended high school.

Young people also experienced greater independence. Dating moved adolescent boys and girls far from the watchful eyes of parents. Youth clubs such as the Boy Scouts, Girl Scouts, YMCA, YWCA, and 4-H gained new members. Racial and ethnic segregation persisted, but comic books and other "kid"-centered aspects of POPULAR CULTURE crossed such social lines. Reflecting the evolution of a separate youth culture, a 1941 article in *Popular Science* introduced the word "teenager" into the American print vocabulary for the first time.

Some of the programs involving children and youth begun during the New Deal era took on new aspects when the United States entered World War II. For example, nursery schools begun by the WORKS PROGRESS ADMINISTRATION to provide unemployed teachers with relief jobs during the Great Depression expanded as a growing pool of mothers entered the wartime labor force. Many parents and child welfare advocates worried that day care was not good for children, but the wartime demand for women's labor overrode such concerns.

The Title V program for maternal and child health of the SOCIAL SECURITY ACT was also transformed by wartime needs. As more men enlisted or were drafted into the military, authorities became concerned about maintaining high morale among the troops. Many soldiers and sailors worried about pregnant wives and newborns unable to get good health care. In response, CONGRESS expanded Title V to include the Emergency Maternity and Infant Care program (EMIC), which provided free prenatal, delivery, postnatal, and infant health care to the wives and children of

enlisted men. This far-reaching effort meant that one out of every seven children born in the United States from 1943 to 1949 could be called a "government baby." And just in time, for overall birthrates rose during the war years—and then continued to climb for the next two decades. EMIC appears to have contributed to the continued decline in the U.S. infant mortality rate, which fell from 47.0 deaths per 1,000 live births in 1940 to 29.2 in 1950. However, despite the program's popularity and the rising U.S. birthrate, Congress had designed EMIC only as a wartime measure to enhance morale among the troops. The program ended with the conclusion of DEMOBILIZATION in 1949.

Some child welfare advocates argued that the demise of EMIC reflected the growing ambivalence among adults about programs for children as the war came to a close. As more mothers worked outside the home, young people gained autonomy that some viewed as a threat to society. The postwar worry about juvenile delinquency actually began on the WORLD WAR II HOME FRONT. The population exploded near military bases and war production centers, and critics raised concerns about unsupervised children and adolescents judged to be "out of control." The 1943 riots against ZOOT-SUITERS in Los Angeles where U.S. sailors and soldiers attacked Mexican-American adolescents, ironically underscored for many adults their perception of rising delinquency among young people. A 1950 report by the U.S. Children's Bureau declared that such conclusions were false, but during the 1940s and 1950s adults became increasingly concerned about juvenile delinquency.

Of course, most children and adolescents did not engage in antisocial behavior during the war. Instead, they participated in SCRAP DRIVES, WAR BONDS sales, and other patriotic endeavors. Some youths took factory, service, or agricultural jobs. Older siblings cared for younger brothers and sisters while parents worked. The military draft included a deferment for all males through age 19 attending high school, but many younger boys lied about their age and joined up anyway.

### cities and urban life

In 1929, America's cities basked in the glow of nearly three decades of rapid growth and general prosperity. By 1932, cities were foundering and sliding toward bankruptcy as they attempted to deal with the massive **UNEMPLOYMENT** of the **GREAT DEPRESSION**. The continuation of the depression for another eight years affected cities in several fundamental ways. First, urban growth nearly halted. Population stagnated and did not rebound until **WORLD WAR II**, while new construction did not reach 1920s levels until the postwar era. Second, the depression created a municipal fiscal crisis that forced cities to cut back drastically on basic urban services and facilities, leaving many of them with serious problems in these areas by 1945. Deteriorating conditions and inadequate **HOUSING** in central cities helped lead to the burgeoning of **SUBURBS** in the postwar era. Finally, urban unemployment and fiscal problems caused cities to turn to the federal **GOVERNMENT** for aid, producing long-term alliances between cities and both the federal government and the **DEMOCRATIC PARTY**. The Second World War then created so many new war-related jobs that rural and small-town people flocked from **RURAL AREAS** to metropolitan areas. A number of southern and western cities expanded rapidly, laying foundations for a major shift in urban population centers away from the Northeast and Middle West toward **SUNBELT** areas of the **SOUTH**, the West, and especially the Pacific Coast.

The most visible impact of the Great Depression in the nation's cities was the huge decline in new construction. Housing starts fell to one-tenth of the peak years of the 1920s, and commercial or industrial construction likewise almost halted. Cities that had been growing rapidly for many decades suddenly seemed frozen in time, looking in 1940 much as they had in 1930. In the residential areas of cities and in their suburbs, miles of streets and sidewalks seemed to disappear as grass and weeds grew up in thousands of vacant lots. By 1940 almost all the major cities faced serious problems that stemmed in part from the depression: an aging and neglected physical plant, increased **TAXATION** made necessary by the decline of property values, and reduced urban services. War production demands created a substantial construction boom of new factories and other facilities in a number of cities and their suburbs; but there was little spending on the urban infrastructure.

Urban population during the 1929–45 era followed a pattern that was dictated by the economic health of each city. Prior to the 1930s, city populations had increased steadily through in-migration and the annexation of outlying suburbs. The Great Depression halted both these trends, and urban population growth slowed dramatically and in some cities was reversed. Among the nation's largest 15 cities, only New York and Los Angeles showed any significant gains, and even their growth rates were far below

those of the 1920s. World War II then reversed the population trend of the 1930s. Between 1940 and 1945, many cities experienced huge influxes of war workers and their families. The arrival of so many new residents created extremely overcrowded housing conditions and increased social problems.

During the 1930s, unemployment and destitution became a familiar part of urban life, most visibly in the big cities. During the depths of the depression, from 1931 to 1933, the nation's largest cities held hundreds of thousands of unemployed people, and **RELIEF** rolls exceeded anything ever seen before. In some manufacturing cities like Detroit, up to half and sometimes higher proportions of the labor force found themselves unemployed or working part-time. By 1931, private charitable agencies were overwhelmed, and municipal governments began to spend ever larger portions of their funds to aid the unemployed.

While **NEW DEAL** programs brought help from 1933 to 1941, the economic atmosphere of cities remained grim. Even in the late 1930s, unemployment remained high, and city dwellers who did hold jobs lived in fear of losing them. Yet without the New Deal's massive job programs, the history of the nation's cities during the depression years could have been quite turbulent. The only major urban violence arising from economic conditions occurred during the middle and late 1930s in connection with the formation of the new industrial **LABOR** unions; but even these disturbances fell far short of anything like a general uprising of the urban working class.

The continuing sluggishness of the urban economy throughout the 1930s also had an impact on the movement of people within cities, and from the city to the suburbs. Both types of movement slowed considerably. Very few people could afford to buy new homes on the urban fringe, and so they remained in houses and neighborhoods that in the normal course of events would have been turned over to a new generation of upwardly mobile families leaving overcrowded, substandard housing. World War II brought rising incomes and an influx of new residents, but little new housing. Thus, by 1945, cities contained a large number of people who had been living for over a decade in undesirable housing conditions, but whose savings were now sufficient to allow them to buy new homes.

In the postwar era, home builders, some of whom had learned how to mass-produce relatively good, inexpensive houses for the federally financed war worker housing projects, responded by constructing huge numbers of houses, mostly in the suburbs. Suburban housing was especially attractive because it allowed families to escape the problems that bedeviled the central cities and which they had been nearly powerless to deal with since 1930. The outflow of the city's middle classes, which had begun in a limited

A tenement in Pittsburgh, Pennsylvania, 1938 (*Library of Congress*)

way in the 1910–30 era, now commenced on a much larger scale.

Only the federal government in the 1930s might have been able to help America's cities sustain themselves as places where a large portion of the middle- and upper-income groups would have wished to live, but it proved unwilling to undertake such an ambitious (and perhaps impossible) task. Although the New Deal was quite active in cities, its spending, with the exception of low-income housing projects, was aimed primarily at relieving urban unemployment and only secondarily at efforts to improve the basic fabric of city life. Even so, the assistance that the New Deal brought to cities and city residents brought Roosevelt and the Democratic Party great support, and the urban vote played a major role in the emergence of the Democrats as the nation's new majority party in the *POLITICS IN THE ROOSEVELT ERA*.

The United States Conference of Mayors, formed in 1932 to seek federal aid for the unemployed, helped draw President FRANKLIN D. ROOSEVELT and the New Deal into their relationship with the nation's cities. Led by Mayor Frank Murphy of Detroit, the conference pleaded with the Roosevelt administration to give cities money to employ the

jobless—a financial burden that cities like Detroit could no longer carry. Indeed, by 1933 most of the nation's cities were headed toward bankruptcy or already in the hands of receivers. The municipal fiscal crisis of 1931–33 arose from the fact that property tax revenues fell sharply at the same time that unemployment relief added a large new item to municipal budgets. Few state governments had the resources, or, dominated by unsympathetic rural legislators, the desire to give cities much if any assistance.

The New Deal responded to the mayors' requests for help by providing millions of dollars for urban employment projects. Almost all the federally funded projects—through such agencies as the FEDERAL EMERGENCY RELIEF ADMINISTRATION, the CIVIL WORKS ADMINISTRATION, and the WORKS PROGRESS ADMINISTRATION—made improvements in the urban environment. These included such activities as street repairs, urban highway and bridge construction, the embellishment of parklands, and the expansion of water and sewer systems; but the projects were never large enough or numerous enough to make a major impact on the overall quality of city life. More important, the Roosevelt administration never conceived of these activities as anything like a coordinated or comprehensive

## 70 Civilian Conservation Corps

attack on the basic urban problems of poverty, lack of education and skills, social disorganization, crime, pollution, and traffic congestion.

The only long-range, permanent urban improvement undertaken by the New Deal was its slum clearance and low-income housing program embodied in the United States Housing Act of 1937. Under the UNITED STATES HOUSING AUTHORITY, terrible slums were cleared and replaced by safe, sanitary public housing projects. The chief drawbacks to the program were its late start and small scale. Still in operation today, it has never come close to replacing all the substandard dwellings in America's cities and has played only a small role in housing the urban poor.

In contrast to the economic stagnation and nearly static nature of the urban physical plant, the social and cultural life of cities retained a real vitality for their heterogeneous populations. City life was grim for the unemployed and impoverished, but for many working-class families and those of middle and upper income, the cities still offered a cornucopia of moderately priced or free entertainments and diversions: parks, playgrounds, professional SPORTS teams, movie theaters, department stores, soda fountains, dance halls, night clubs, amusement parks, and dozens of other attractions. Crime, vice, juvenile delinquency, and poverty continued to plague cities, but were accepted as part of the price of urban living—balanced by the big and little pleasures of city life.

A significant long-term trend often obscured by the economic problems of cities was that ethnic differences and antagonisms began to fade as the immigrants of the 1890–1920 era were gradually replaced by the second and third generations. Most cities still had their Little Italy or Polish Town; saloons (brought back by the end of prohibition) still catered to particular ethnic groups; and urban political machines still based much of their strength on ethnic allegiances. But dance halls, cabarets, and amusement parks became places where younger people of all backgrounds were thrown together. Both neighborhood theaters and downtown movie palaces showed Hollywood MOVIES that largely ignored the distinctiveness of America's ethnic cultures and thus tended to undermine them. City park and RECREATION departments sponsored a variety of sports and recreational programs that also brought people from different ethnic groups into contact. Tensions and even conflict persisted, and AFRICAN AMERICANS and MEXICAN AMERICANS remained isolated—but important change was under way.

World War II turned attention to the use of America's cities as war production centers. The huge task of economic MOBILIZATION for war ended urban unemployment and actually created a greater demand for workers than the local labor force could supply. Extraordinarily heavy wartime MIGRATION added a new layer of in-migrants to

American cities, particularly in rapidly growing Sunbelt cities. Despite some tensions between in-migrants and old-timers, the wartime emphasis on national unity, the breakdown of ethnic (and to some degree racial) barriers in war plants, and the intermingling of peoples at USO centers and other recreational facilities further reduced ethnic suspicions and differences. However, the renewed influx of African Americans, and a substantial immigration of Mexican immigrants into the cities of the West Coast, often heightened racial animosities and in some cities brought a wave of racial violence.

In conclusion, America's cities suffered significantly during the Great Depression from massive unemployment and financial problems that forced them to cut back drastically on municipal facilities and services. The New Deal made its major contribution to the nation's cities by giving work relief to the unemployed. Despite federal construction projects in the cities, the urban physical plant as a whole, and especially urban housing, was in poor condition by 1945. There was never any major attempt to address the basic social, economic and physical problems of the cities, problems sometimes exacerbated by World War II. When the war ended, the central cities appeared increasingly unattractive to many of its middle- and upper-income residents. They began to move to the suburbs and new housing as quickly as possible—creating problems for central cities that ultimately became even more serious than the ones they faced during the 1930s.

### Civilian Conservation Corps (CCC)

Established in March 1933 during the first Hundred Days of the FRANKLIN D. ROOSEVELT administration, the Civilian Conservation Corps (CCC) was an important part of both the conservation and the RELIEF efforts of the NEW DEAL. One of the most popular New Deal agencies, it was also especially close to the heart of Roosevelt himself. Deeply troubled by the plight of hundreds of thousands of youthful transients at the depth of the GREAT DEPRESSION, Roosevelt and others saw the CCC as a way to conserve not only the nation's land and natural resources but also the spirits of young men by providing them income and

new opportunities and experiences. The CCC peaked at roughly a half million workers in 1935, ultimately employed a total of some three million young men over its 1933–42 lifetime, and accomplished a large and imaginative assortment of projects.

At its inception, the CCC was authorized to employ some 250,000 young men in a variety of conservation efforts. Jobless young men between 18 and 25 years old were to enlist for a period of six months (renewable for three more terms, or up to two years) and were paid \$30 a month (\$25 of which they were to send home) for working on a variety of conservation projects. The program worked through established GOVERNMENT agencies, coordinated by the CCC director, with the Labor Department selecting the young men, the War Department transporting them to camps, and the Agriculture and Interior Departments supervising the projects. The CCC did not enroll women, and it imposed a quota on AFRICAN AMERICANS and operated segregated camps.

Perhaps most noted of the CCC accomplishments were its reforestation projects, which accounted for some 75 percent of all trees planted in the nation down to 1942. But the CCC did far more than this—in implementing other forms of erosion control; in protecting wildlife and building some 300,000 wildlife shelters; in stocking nearly 1 billion fish; in developing trails, campgrounds, and other infrastructure in national parks; in preserving and restoring national historical sites; in building dams for flood control; in building firebreaks, lookout towers, and trails for fire control; and in other ways protecting, preserving, and beautifying the nation's natural and built environment. And in accomplishing such tasks, the CCC also pioneered in work relief that brought needed money to destitute young people and their families. Like subsequent New Deal programs aimed at work relief, training, and education for young people, it also had the desired effect of keeping them off the job market, so that jobs might go to unemployed adults.

As a work-relief agency, the CCC seemed increasingly unnecessary and was vulnerable to conservative opposition as prosperity returned with WORLD WAR II. Even before the off-year election of 1942 gave a clear ideological majority to the congressional CONSERVATIVE COALITION of Republicans and conservative Democrats, Congress stepped up its opposition to such holdover 1930s agencies as the WORKS PROGRESS ADMINISTRATION (WPA) and the CCC. The CCC's numbers had been falling steadily since the late 1930s in any event, and by 1942 it was to focus its efforts on those related to the war effort. Even public support for the CCC waned in these new circumstances. In July 1942, Roosevelt unhappily terminated the agency after Congress cut off its appropriations.

## civil liberties

The term *civil liberties* refers to individual rights guaranteed in the federal Constitution, particularly in the Bill of Rights, and often refers especially to First Amendment rights of speech, RELIGION, the press, assembly, and petitioning the GOVERNMENT. From 1929 to 1945, civil liberties issues sometimes involved efforts at CENSORSHIP in such areas as MOVIES, the NEWS MEDIA, and LITERATURE, but they more often arose out of efforts to clamp down on radicalism and to protect national security. Despite challenges to civil liberties, the era also helped lay foundations for protecting and expanding civil liberties in the postwar era.

During the 1930s, government policies that raised worries about abridging First Amendment rights were largely responses to perceived threats from political groups on the far left and far right. In 1938, the House Committee on Un-American Activities was formed, and in 1939, CONGRESS passed the Hatch Act, denying federal employment to anyone belonging to a revolutionary group. The loyalty board of the Civil Service Commission subsequently increased its investigations of the political backgrounds and beliefs of potential employees. COMMUNISTS were often under surveillance and their literature was subject to confiscation, but the government also watched American Bundists and other pro-Nazi or pro-Fascist groups.

The economic impact of the GREAT DEPRESSION also led to concerns about civil liberties. High UNEMPLOYMENT levels and stiff competition for jobs, for example, led government officials to deport thousands of MEXICAN AMERICANS, many of whom were U.S. citizens, in the MEXICAN REPATRIATION PROGRAM. The growth and increased activism of organized LABOR raised worries about civil liberties, for during previous times of labor conflict, government had often taken the side of management and disregarded the civil liberties of workers and their leaders. By the mid-1930s, however, workers had gained significant protection under the law to organize, bargain collectively, and conduct strikes, especially with the passage of the NATIONAL LABOR RELATIONS ACT of 1935.

With the U.S. entrance into WORLD WAR II, some feared a renewal of the repressive governmental policies of World War I. The SMITH ACT of 1940 had authorized the deportation of any alien belonging to a “revolutionary” organization or expressing revolutionary sentiments, and it outlawed speech attempting to breed disloyalty in the military or advocating the overthrow of the government. But only two cases were brought under the Smith Act during

the war, and fears of a repressive home front proved generally to be unfounded. Widespread popular support for the war effort and a dearth of outspoken protestors, as well as the memory of World War I excesses, helped prevent widespread violations of civil liberties.

Even the draft did not ignite extensive protest, as it had in World War I and would years later during the Vietnam War. Groups such as the AMERICAN CIVIL LIBERTIES UNION, which championed civil liberties in a number of important episodes in the era, failed to protest the passage of the SELECTIVE SERVICE Act of 1940, although it tried to ensure that the draft was implemented democratically. The act provided alternatives for CONSCIENTIOUS OBJECTORS, and men who refused to participate in combat for religious reasons were offered noncombatant or civilian duties. However, those who objected for purely political reasons or for religious reasons deemed illegitimate were not excused, and more than 5,000 objectors were imprisoned over the course of the war.

But the WORLD WAR II HOME FRONT did witness one of the most egregious violations of civil liberties in American history, the relocation of JAPANESE AMERICANS, citizens and noncitizens alike, and their incarceration in internment camps. The SUPREME COURT let the relocation policy stand in the case of *KOREMATSU V. UNITED STATES*. Unnaturalized German-American and Italian-American immigrants were also labeled ENEMY ALIENS and subjected to various regulations, but these did not involve violations of the civil liberties of citizens.

## civil rights

Civil rights means, in effect, citizenship rights, including the rights to move about freely, to have economic opportunity, to obtain an education, to rent or own a home wherever personal fortune permits, to have access to public accommodations, and to vote and hold public office. The U.S. Constitution and its Bill of Rights incorporated civil rights into the nation's fundamental law. The extension of civil rights to all citizens has become a central tenet of American political culture and embodies the idea that "the people" have certain basic rights that may not be violated.

Until the era of the Civil War and Reconstruction, however, and the adoption of the Thirteenth, Fourteenth, and Fifteenth Amendments to the Constitution, the civil rights of AFRICAN AMERICANS were denied by slavery

or abridged by law and custom. By the early 20th century, a series of "Jim Crow" laws and practices producing segregation, disfranchisement, and discrimination in the SOUTH had eliminated most of the civil rights gained during Reconstruction. In other regions, custom and law also abridged the rights of African Americans and sometimes those of ASIAN AMERICANS and MEXICAN AMERICANS. The post-World War I period did not produce much progress toward safeguarding civil rights despite growing black protest, the activities of the NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE (NAACP), and the "Great Migration" of blacks from the rural South to urban areas of the nation.

The 1930s brought some limited gains in the area of civil rights for African Americans. The 1931 SCOTTSBORO BOYS case, in which Alabama authorities jailed and prosecuted nine young black men wrongly accused of raping two white women, brought national attention to civil rights, and ultimately federal court decisions overturned the convictions. During the decade, the NAACP and its executive secretary, WALTER WHITE lobbied heavily for the Costigan-Wagner antilynching bill from its introduction in CONGRESS in 1933 until its final failure late in the decade. Fear of the bill's passage did help reduce lynchings, and ANTI-LYNCHING LEGISLATION won significant support from the public and northern congressmen and senators, but President FRANKLIN D. ROOSEVELT, fearing alienating southern Democrats he thought crucial to his NEW DEAL programs, refused to sponsor it or other corrective federal legislation. The New Deal itself did little for civil rights, though its programs were extended to African Americans and ELEANOR ROOSEVELT, HAROLD ICKES, and others supported efforts to safeguard civil rights, as did the unofficial BLACK CABINET that advised the president.

Meanwhile, the NAACP and other groups continued chipping away at the wall of legal segregation. During the HOOVER PRESIDENCY, the NAACP had helped block the nomination to the SUPREME COURT of John J. Parker, a foe of civil rights for blacks. The all-white Democratic primary, which prevented blacks from taking part in the most important elections in the one-party Democratic South, remained a particular target of the NAACP Legal Defense Fund, which pursued a number of cases, culminating in *Smith v. Allwright* in 1944 that found the all-white primary unconstitutional. The NAACP's efforts in the 1930s and 1940s also produced decisions against segregation in higher EDUCATION that laid groundwork for the 1954 decision of *Brown v. Board of Education of Topeka* that overturned the legal sanction given segregation by *Plessy v. Ferguson* in 1896.

As WORLD WAR II approached, blacks remained largely excluded from economic opportunity. In 1941, the black activist A. PHILIP RANDOLPH organized the MARCH

A drinking fountain on the county courthouse lawn, Halifax, North Carolina, 1938 (*Library of Congress*)

ON WASHINGTON MOVEMENT and threatened a mass march on Washington to protest discrimination in defense plant hiring and in the armed forces. To head off the march, FDR issued EXECUTIVE ORDER 8802, which forbade discrimination on grounds of race, nationality, and religion in defense industry and government hiring and established the FAIR EMPLOYMENT PRACTICES COMMITTEE (FEPC) to implement the new rules.

The war years nonetheless saw continued denials of the civil rights of African Americans and other minorities. The most notable wartime violation of civil rights and CIVIL LIBERTIES was the relocation of JAPANESE AMERICANS, citizens and noncitizens alike. The South denied black servicemen civil rights that it granted German PRISONERS OF WAR, and despite Executive Order 8802, blacks only slowly were offered jobs in defense industry. The armed forces remained segregated for most of the war. Mexican Americans encountered discrimination in the West and Southwest. Wartime patterns of RACE AND RACIAL CONFLICT included race riots in the summer of 1943 between whites and African Americans and Mexican Americans.

Even so, World War II marked a turning point for civil rights. Black protest increased—the NAACP mushroomed from some 50,000 members to 450,000 members, for example, and many blacks talked about a double victory over the AXIS abroad and Jim Crow at home. White Americans outside the South became more aware of discrimination against African Americans and other racial minorities, in part because of the highly influential and best-selling 1944 study of American race relations by GUNNAR MYRDAL, *An American Dilemma*. Executive Order 8802 was a significant initiative, and by the end of the war a number of northern states had adopted interracial commissions and civil rights had won a new place on the agenda of liberals and northern Democrats. The armed forces had begun to move toward desegregation. And the wartime rhetoric of democracy and of opposing the master race philosophy of Nazi Germany resonated in postwar America and helped build more support for civil rights.

### Civil Works Administration (CWA)

The Civil Works Administration (CWA) was a NEW DEAL program that provided work RELIEF in the winter of 1933–34. In the autumn of 1933, relief administrator HARRY HOPKINS persuaded President FRANKLIN D. ROOSEVELT that millions of Americans would suffer during the coming winter without major new action. The ECONOMY was not recovering sufficiently to provide jobs for the unemployed, the PUBLIC WORKS ADMINISTRATION (PWA) could not produce a significant number of jobs until the spring of 1934, and the FEDERAL EMERGENCY RELIEF ADMINISTRATION (FERA) could not provide sufficient assistance for the jobless. UNEMPLOYMENT remained at over one-fifth of the labor force.

Early in November 1933, Roosevelt transferred \$400 million from the PWA and authorized Hopkins to establish the Civil Works Administration, which would implement work-relief projects to hire unemployed workers. Unlike the FERA, the CWA was entirely a federally supported program and was from the first a work-relief agency that hired needy people to work on specific projects, an approach that Hopkins and Roosevelt much preferred to dispensing direct relief. Half of the CWA workers came from existing relief rolls, but the other were unemployed and were not subjected to a means test. CWA workers were paid at regional average minimum wages, well above prevailing relief payments.

Harry Hopkins implemented the new agency with his characteristic energy. By late November, nearly 1 million workers had received their first checks from the CWA, and its height in mid-January, the agency employed more than 4 million people. Spending some \$900 million in just a few months, the CWA inevitably involved some inefficiencies and slipshod or seemingly unnecessary work (often called “boondoggles”), but it also enriched the nation’s infrastructure. CWA built or improved 40,000 schools, 1,000 airports, 3,500 parks and playgrounds, and hundreds of thousands of miles of roads. It laid more than 10 million feet of sewer pipe and built 150,000 outhouses for rural families. It employed 50,000 teachers and some 3,000 artists and writers. And it helped the nation through the winter of 1933–34, providing the dignity of work instead of a handout and raising both the income and the spirits of millions of Americans, not only in the Christmas season of 1933 but through the rest of the winter as well.

The CWA nonetheless came to seem too expensive and too vulnerable to President Roosevelt, who terminated

it in the spring of 1934. It had served its essential function of seeing the country through the winter of 1933–34; it was increasingly criticized for inefficiency and political manipulation (although, as with other New Deal relief efforts, corruption and graft were remarkably small); and by the spring, the administration hoped that economic improvement and PWA projects would provide jobs for CWA workers. Always concerned about the psychological impact as well as the costs of GOVERNMENT relief, moreover, Roosevelt was worried about creating a permanent group of people dependent upon government jobs and money. As early as February, Hopkins began reducing CWA rolls in the South, where warm weather returned first; and by early April he had let some 4 million workers go throughout the nation. A number of CWA projects were taken over by the FERA in 1934, and beginning in 1935, the WORKS PROGRESS ADMINISTRATION would begin an even more expansive work-relief program. Although a short-lived agency, CWA was nonetheless an important one, not only in the help it gave and in the projects it undertook but also in the precedents it established for work relief and federal responsibility for economic security.

### coal industry

Throughout the 1920s, the coal industry declined because of a profusion of mines and miners, large coal surpluses, and shrinking demands for their product. By 1927 bituminous (soft) coal production had fallen 60 million tons from the 1920 levels, while the number of miners constricted from 700,000 to 575,000. Moreover, the business was locked in a volatile competition involving numerous small nonunion companies, which usually resulted in lower wages being paid. In 1924 the secretary of commerce, HERBERT C. HOOVER, attempted to remedy the situation by arranging the so-called Jacksonville Agreement between management and the militant UNITED MINE WORKERS OF AMERICA (UMW) to stabilize the industry by establishing wage and production levels. But the agreement proved unenforceable due to harsh regional competition, and the plight of both the industry and its workers worsened steadily. The onset of the GREAT DEPRESSION in 1929 further exacerbated conditions in coal mining. As American industry began closing down, there was less demand for coal as an energy source, which in turn led to mass UNEMPLOYMENT in mining and greatly reduced wages. The miners and their families grew increasingly desperate and, at the behest of UMW president JOHN L. LEWIS, they resorted to their only

Coal miners in Jenkins, Kentucky, 1935. Photograph by Ben Shahn (*Library of Congress*)

remaining tactic—**STRIKES**. This militancy may have worsened their condition initially, but it induced the National Association of Manufacturers to encourage formation of economic cartels aimed at restricting overt competition and increasing wages, prices, and profits. President Hoover also encouraged voluntary cooperation among various sectors of the mining industry to the same ends. However, neither approach could mitigate the scope of deprivation occasioned by the depression, and the coal mining industry continued on the verge of collapse.

It took the election of **FRANKLIN D. ROOSEVELT** to create an improved climate for recovery. In 1933 Roosevelt sponsored the **NATIONAL RECOVERY ADMINISTRATION (NRA)**, which produced industrial codes written by business, **LABOR**, and **GOVERNMENT** representatives. In coal mining and other industries, such codes contained authority for imposing price fixing to maintain wages and profits. That year the government also established the Coal Arbitration Board to secure the peaceful resolution of strikes. Finally, in 1935, **CONGRESS** passed the comprehensive Guffey-Snyder Coal Stabilization Act, which legalized the miners' right to organize under collective bargaining, insti-

tuted minimum wages and maximum hours, and created a federal commission tasked with fixing prices and allocating production. When noncompliance from the private sector proved endemic, the government tightened its control over the industry even further. In 1935, when the **SUPREME COURT** ruled that the **NRA** was unconstitutional, Congress responded by passing the **NATIONAL LABOR RELATIONS ACT (NLRA)**, which guaranteed workers the right to unionize and facilitated the growth of trade unionism in mining. In 1936, the Supreme Court declared the Guffey-Snyder Act unconstitutional, though it did uphold the **NLRA** in 1937.

Despite all these efforts, the coal mining industry languished until the United States entered **WORLD WAR II** and, like virtually all union leaders, **UMW** president Lewis agreed to a "no-strike pledge" until the end of hostilities. Production rates soared commensurately, but wage caps imposed by the **NATIONAL WAR LABOR BOARD** restricted increases to the rate of inflation, or 15 percent. This limit induced Lewis to initiate a series of strikes in summer 1943, which the public perceived as unpatriotic in light of the overall war effort. Roosevelt, using authority granted to him by

the 1943 Smith-Connally War Labor Disputes Act, was preparing to have U.S. troops seize the mines when the UMW finally relented. That October Lewis again determined that the wage cap imposed by the government was excessive, and he called for a second strike. This time the government seized control of the mines, but the impasse continued until Secretary of the Interior HAROLD ICKES agreed with Lewis to boost miners' wages. Though ultimately successful, the UMW's militancy alienated many former supporters in the DEMOCRATIC PARTY and also began tilting public opinion against organized labor in general.

## code breaking

Code breaking played an important role in WORLD WAR II. Codes are systems of words, letters, or symbols that represent others. A code substitutes groups of two or more numbers or letters for words, phrases, or sentences making up a message. A cipher substitutes a letter or number for each letter of the message. After Samuel Morse invented his code of dots and dashes for telegraph communication in the 1830s, hundreds of different ways were soon invented to encode and decode the messages, and the invention of cipher machines and computers in the 20th century made the process of encoding and decoding faster and more complex. The German Enigma machine and the Japanese "J" or Type 97 Alphabetical Typewriter, or Purple machine, are the most famous examples.

Codes and ciphers were used during the American Civil War, the Russo-Japanese War of 1904–05, and World War I, but greater attention was devoted to code breaking following Britain's founding of the Code and Cypher School at Bletchley Park in 1919. Numbering 150 people in 1939, the Bletchley Park staff increased to 3,500 in 1942 and to 10,000 by 1945. Approximately 65 Americans worked at Bletchley Park, working almost exclusively on the German Enigma machine ciphers, which produced Ultra INTELLIGENCE, the code name for decrypted German and Italian radio messages. The British first deciphered German Enigma codes in May 1940.

The American code word *Magic* represented intelligence derived from Japanese diplomatic communications using the Purple machine, while *Ultra* referred to intercepted and decoded military communications. Unlike Great Britain and the USSR but like the AXIS nations, the United States did not have a central code and cipher school and

operated separate offices within the military services. The U.S. NAVY Operations Division (N-2) and the War Department General Staff (G-2) began code and cipher operations (known as cryptanalysis, which was distinct from traffic analysis) in 1924 and 1929, respectively. Americans working for the U.S. ARMY Signal Intelligence Service, later known as the Special Intelligence Branch, Military Intelligence Service, under Colonel William F. Friedman, first broke the Japanese Purple diplomatic code in September 1940 and provided a machine to the British in 1941. Although only occasionally deciphered through 1940 and 1941, the Japanese Purple code was read with increasingly regularity by 1942. By spring 1942, American code breakers working for the U.S. Navy Communications Security Unit formed by Commander Laurence F. Safford, were also reading messages enciphered in the Japanese naval code, known as JN-25. Breaking the JN-25 code was an extraordinary feat as the code comprised some 45,000 five-digit groups, each signifying a word or phrase, further embedded in additional five-digit groups taken from a continually changing list of 50,000 random numbers. Perhaps the greatest triumph of this navy unit during the war, under Commander Joseph P. Rochefort, Jr., was the accurate prediction of the Japanese attack at the BATTLE OF MIDWAY in time for Americans forces to take effective countermeasures and turn the tide of the war in the PACIFIC THEATER in June 1942.

The Germans and Japanese used many codes and ciphers during the war, some of which were never broken. The Japanese had more than 50 codes, while the Allies knew of 200 German codes by 1945. The Axis powers were convinced that their systems were unbreakable, as were the Allies, although both sides were successful in breaking each other's code to some extent. The Allied emphasis on strict security, especially between the Americans and British, prevented the Axis, and the Soviet Union, from breaking their codes following 1943, while Allied intelligence services had increasingly regular and direct knowledge of Axis plans through decrypted enemy communications after 1942.

## Committee to Defend America by Aiding the Allies

In 1939, events in Europe prompted formation of the Non-Partisan Committee for Peace through Revision of the

Neutrality Act, which supported the FOREIGN POLICY of the administration of President FRANKLIN D. ROOSEVELT. Its purpose was to mobilize public support for the president's plan to enact CASH-AND-CARRY policies to allow France and England to obtain American arms to fight Nazi Germany. However, Germany's smashing BLITZKRIEG in spring 1940 prompted concerned parties to revise the organization into a new entity, the Committee to Defend America by Aiding the Allies (CDAAA). It was headed by Clark M. Eichelberger, executive director of the League of Nations Association, and William Allen White, respected editor of the Emporia (Kansas) *Gazette*. The committee advocated direct governmental aid and assistance to the beleaguered Allies short of direct American intervention. Eichelberger proved something of an organizational genius in this respect, for by that fall the committee boasted 750 local chapters in all 48 states, along with a donor list numbering 10,000 and annual expenditures of \$230,000. One of its first objectives was marshaling public support behind Roosevelt's DESTROYERS-FOR-BASES DEAL with Great Britain, whereby the Royal Navy obtained 50 antiquated destroyers in exchange for naval bases in the Atlantic and the Caribbean. It also supported the LEND-LEASE program. However, its influence waned following White's resignation for health reasons in January 1941, and many chapters of the committee broke away to join the new and more aggressive Century Club Groups, based in New York City, which agitated for direct American intervention. The CDAAA's advocacy became further complicated in June 1941, following the Nazi invasion of the Soviet Union, because of the aversion of many members to Joseph Stalin and Communism, so rather than imply that the Soviets were allies it renamed itself simply Committee to Defend America (CDA). The committee's existence proved moot following the December 7, 1941, Japanese attack on PEARL HARBOR, and by January 1942 it had formally merged with the Council for Democracy to form a new entity, Citizens for Victory.

## Communists

While they were never a major force in American politics, the high point of influence for Communists came during the 1930s, when the GREAT DEPRESSION gave them hope that the impending collapse of capitalism would create favorable conditions for Marxist revolution in the

United States. The Communist Party of the United States (CPUSA) attracted disappointingly small political support and membership gains from 1929 to 1945, but Communists did play important roles in LABOR and other reform efforts in the 1930s. As directed by the Soviet Union, Communists also sometimes infiltrated GOVERNMENT agencies during the NEW DEAL and WORLD WAR II.

In the early years of the Great Depression, Communists established Unemployed Councils, which acted as local RELIEF agencies, and organized protest demonstrations and marches against poverty, joblessness, and hunger. Communists also fought for AFRICAN AMERICANS, as in the SCOTTSBORO BOYS case, although blacks never comprised over 10 percent of CPUSA membership. In the ELECTION OF 1932, however, Communist Party candidate William Z. Foster (and his African-American running mate, James Ford) received just 103,000 votes (three-tenths of 1 percent of the total popular vote), despite UNEMPLOYMENT of at least one-fourth of the labor force and the failure of the HOOVER PRESIDENCY and private enterprise to improve economic conditions.

But however favorable the circumstances for enlarged membership were, American Communists remained overtly beholden to the Communist International (Comintern) in Moscow. At that time, the Comintern's Sixth World Congress decreed that they alone formed the vanguard of revolution, and that party members around the world were expected to aggressively assert themselves and seize control of the working-class movement. Accordingly, Communists brooked no competition and harshly attacked reformists and other radical elements as traitors. Their vocal stridency had the net effect of preventing any cooperation between leftist groups and effectively kept them isolated from mainstream LIBERALISM until 1935.

From 1933 to mid-1935, Communists denounced new President FRANKLIN D. ROOSEVELT and his New Deal legislation, labeling FDR "a social fascist" who was worse than his predecessor, HERBERT C. HOOVER, and whose programs were "the same as [Adolf] Hitler's." Communists were especially critical of such key New Deal legislation as the NATIONAL INDUSTRIAL RECOVERY ACT, calling it a "slave program"; the AGRICULTURAL ADJUSTMENT ACT, which rewarded large farmers at the expense of sharecroppers, tenants, and migrant workers; and the NATIONAL LABOR RELATIONS ACT, termed an "antistrike" bill.

In the summer of 1935, the Communist line changed, when Soviet leader Joseph Stalin ordered a POPULAR FRONT strategy, with the Communist Party to forge alliances with SOCIALISTS, other left-wing groups, and liberals in the fight against fascism. American Communists were told to stop criticizing Roosevelt and the New Deal and work to gain influence within mainstream labor unions, peace, and youth groups. Thus disposed, the party took an

active lead in organizing union members in various industries, spearheading a drive for black CIVIL RIGHTS throughout the SOUTH and helping to spread an activist, antifascist message on college campuses. Despite their new, more pragmatic approach, Socialists remained skeptical and often hostile to CPUSA motives. The Roosevelt administration took a largely benign attitude toward Communists, believing that they were no threat to domestic order and had little influence as a political party.

During the Popular Front period from 1935 to 1939, Communists had their greatest impact in the industrial unions. When JOHN L. LEWIS and the mass production unions separated from the AMERICAN FEDERATION OF LABOR to create the CONGRESS OF INDUSTRIAL ORGANIZATIONS (CIO), Communists helped organize automotive and steel workers, resulting in control of a third of CIO unions by the late 1930s, and party influence in the national organization. With considerably less success, but with great personal courage, Communists attempted biracial organization of southern sharecroppers and tenant farmers and of California agricultural workers, an effort which was crushed by planters and growers. By dint of hard work and energetic organizing, the late 1930s was perhaps the apogee of Communist influence in labor matters. Party membership constituted only 1 percent of the CIO's overall workforce, yet by 1945 Communists clearly controlled 14 unions with 1.5 million workers. Another 1.5 million workers belonged to unions where Communist influence was very strong.

Although Communists were active in the political life of the 1930s, they had little success in building membership or political power. While an estimated 200,000 to 250,000 people joined the CPUSA during the decade, few stayed for more than a year, resulting in low membership numbers. Actual membership figures of the CPUSA ranged from about 9,000 in 1929 to roughly 80,000 ten years later. The CPUSA evolved from being a party of the unemployed with a largely foreign-born, Jewish, and New York-based leadership to a more middle-class, union-affiliated, and native-born membership. Few blacks or women were members, and even fewer had leadership roles. In the ELECTION OF 1936, Communist Party national chairman Earl Browder received only some 80,000 votes for president—just two-tenths of 1 percent—and he attracted barely more than half that total in 1940.

The Popular Front strategy remained the Moscow-directed policy for American Communists until August 1939, when the NAZI-SOVIET PACT was signed. For the next two years, Communists joined ISOLATIONISTS in criticizing Roosevelt's anti-AXIS defense and foreign policy, including the SELECTIVE SERVICE Act and LEND-LEASE, and some party members spoke at AMERICA FIRST COMMITTEE rallies. Hitler was treated as an ally of the Soviet Union by the CPUSA until Germany invaded Russia in

mid-1941, when the Communists reversed themselves again and attacked fascism. After PEARL HARBOR, Communists supported the war effort, endorsing universal military training and no-strike pledges by labor and calling for national unity.

In addition to the visible public world of American communism, a covert world also existed. The CPUSA was used by the Soviet Union to infiltrate federal government agencies from the AGRICULTURAL ADJUSTMENT ADMINISTRATION and NATIONAL LABOR RELATIONS BOARD to the State and Treasury Departments, and even the White House staff. Communists also engaged in ESPIONAGE during World War II, including gathering information on the nation's most closely guarded secret, the MANHATTAN PROJECT to produce the ATOMIC BOMB. Although the extent and impact of Soviet-sponsored espionage has often been exaggerated, it was nonetheless significant, as the release of documents in Moscow and Washington in the 1990s demonstrated.

The CPUSA, whose membership peaked at 80,000 in 1939, declined rapidly after World War II, as the cold war and domestic ANTICOMMUNISM so depleted the party that American communism had nearly ceased to exist by the late 1950s.

## Congress

Reflecting the political developments of the era, control of Congress from 1929 to 1945 shifted from the REPUBLICAN PARTY to the DEMOCRATIC PARTY, and Congress enacted major programs increasing the size, cost, and power of the federal government. Changes in American GOVERNMENT arising from the NEW DEAL and WORLD WAR II significantly enhanced the power of the PRESIDENCY, but Congress nonetheless played a large role in shaping domestic and foreign policy, particularly in the 1930s. Within Congress, power typically resided more with committee chairmen, the "barons" of Capitol Hill, than with the Speaker of the House or the Senate majority leader.

The election of 1928 that sent HERBERT C. HOOVER to the White House by an overwhelming margin also continued the control of Congress that Republicans had enjoyed in the 1920s. (See table "Party Strength in Congress, 1929–1946" on page 80.) Hoover called Congress into special session in the spring of 1929 to deal with economic issues facing farmers, and within two months, Con-

gress passed the AGRICULTURAL MARKETING ACT. In 1930, Congress also passed the HAWLEY-SMOOT TARIFF ACT, a much-criticized tariff that went beyond Hoover's wishes by raising protection to the highest levels ever. In the remainder of the year, Congress generally acquiesced in the president's program to deal with the early stages of the GREAT DEPRESSION.

In the off-year congressional elections of 1930, the Democrats made striking gains. Losing eight senators, Republicans held only a 48-47 edge in the Senate (a Farmer-Labor senator held the other seat). Each party won 217 seats in the House, with one Farmer-Labor representative as the potential decisive vote; but by the time Congress assembled in late 1931, deaths and replacements favoring the Democrats gave them a 220-214 seat majority. Despite the swing to the Democrats, the 1930 election results did not reflect quite such a rejection of Hoover and the Republicans as the totals might suggest, for the turnover of some 50 seats in the House was only about 15 more than the average loss for the incumbent president's party in off-year elections since 1900. Moreover, the Republicans, who won some 54 percent of the total popular vote for Congress, remained clearly the majority party outside the SOUTH. The loss of eight Senate seats, on the other hand, was about twice the usual number for the party holding the presidency and provided an early indication of the impact of the depression on the Republican Party.

The 72nd Congress that met in the final two years of the HOOVER PRESIDENCY only slowly staked out positions much different from Hoover's. A number of key Democratic leaders were southern conservatives who shared Hoover's concern about the federal government doing and spending too much. Early in 1932, Congress established at Hoover's request the RECONSTRUCTION FINANCE CORPORATION to lend money to banks and other financial institutions to help them weather the depression.

But as the ECONOMY continued down and as UNEMPLOYMENT continued its sharp rise, Congress became more active. A coalition of Democrats and progressive Republicans, often led in the Senate by New York Democrat ROBERT F. WAGNER, Wisconsin Republican ROBERT M. LA FOLLETTE, JR., and Nebraska Republican GEORGE W. NORRIS, pushed for public works and RELIEF spending. Partly to embarrass Hoover, conservative Democrats also became more assertive and critical of his policies. When Hoover vetoed the Garner-Wagner relief bill, Congress virtually forced upon him the RELIEF AND RECONSTRUCTION ACT of 1932, a compromise measure enabling the federal government to lend states money for relief and public works. Still, neither Congress nor the Democrats were ready to move much beyond Hoover, as revealed by their refusal to mandate direct relief assistance to the unemployed and by their approval of a record peacetime

tax increase in 1932, supported by an emotional plea for balancing the budget by Speaker of the House JOHN NANCE GARNER.

Democrats overwhelmingly controlled the 73rd Congress following their landslide victory in the ELECTION OF 1932. Though southern Democrats dominated leadership posts because of their seniority, the new Congress nonetheless proved exceptionally responsive to the agenda of new president FRANKLIN D. ROOSEVELT—and, in any case, southerners in the House and Senate tended to be more liberal than northerners on domestic economic policy in the early and mid-1930s. Not only did Democrats want to make a positive record to contrast with that of Hoover and the Republicans, but over half of the Democrats in Congress has been elected in 1930 and 1932, and were disposed to following the president and his more liberal policies. Roosevelt effectively used his personal leadership and patronage power to win support in Congress. Above all, the collapse of the economy—unemployment was at least 25 percent by early 1933 and national production and income were down by about 50 percent—compelled action. In the hundred days that produced the so-called FIRST NEW DEAL of 1933, Congress enacted a host of major programs, focusing especially on recovery and relief and including the NATIONAL INDUSTRIAL RECOVERY ACT, the AGRICULTURAL ADJUSTMENT ACT, and the FEDERAL EMERGENCY RELIEF ADMINISTRATION.

The election of 1934 then registered great public support for the New Deal. Counter to the usual trend in off-year elections, Democrats picked up seats in both the House and the Senate. Democratic gains came especially in urban areas, and in the 74th Congress urban liberal Democrats, led by Robert F. Wagner, had more power than before. The SECOND NEW DEAL enacted by Congress in 1935 reflected the greater strength of liberal Democrats and included such landmark reform legislation as the EMERGENCY RELIEF APPROPRIATIONS ACT, the NATIONAL LABOR RELATIONS ACT (also called the Wagner Act), the SOCIAL SECURITY ACT, and the REVENUE ACT OF 1935 (or "Wealth Tax"). But while Congress remained remarkably responsive to the president, it also asserted its own priorities. The Wealth Tax, for example, was more limited than Roosevelt had wanted, and Congress (especially Senator Wagner) was much more responsible than Roosevelt for the Wagner Act supporting organized labor.

The ELECTION OF 1936 gave Democrats their most top-heavy control of Congress ever. Yet even though voters had ratified the New Deal and reelected Roosevelt by a record landslide, Roosevelt achieved little of the expansive program he had in mind for his second term. A CONSERVATIVE COALITION of Republicans and conservative Democrats in Congress began to cooperate across party lines to oppose liberal measures. The coalition arose partly from

the changing nature of the Democratic Party, increasingly dominated by northern liberals pursuing the agenda of urban LIBERALISM and eclipsing southern, conservative, and rural leaders in the party. The coalition also reflected the continuing strength of CONSERVATISM in the nation, a prevailing “antimetropolitan” ideology in a Congress where rural constituencies retained a disproportionate influence, and also a sense that power was shifting too far to the presidency at the expense of the Congress. Roosevelt’s heavy-handed, and ultimately successful, effort to have the Senate elect Kentucky’s Alben Barkley as majority leader over Mississippi’s Pat Harrison further disaffected southern and conservative Democrats in Congress.

A series of events in 1937–38—especially Roosevelt’s COURT-PACKING PLAN, sit-down STRIKES by LABOR, and the RECESSION OF 1937–1938—brought the formation of the conservative coalition. In November 1937, a bipartisan group led by southern Democrats issued a “Conservative Manifesto,” criticizing the New Deal welfare state and insisting upon lower taxes, balanced budgets, states’ rights, and small government. A varying coalition of Republicans and conservative (mostly southern) Democrats cooperated to oppose key administration proposals beginning with the 1937 court-packing bill. The president did have some limited successes in his second term—the UNITED STATES HOUSING AUTHORITY, the FARM SECURITY ADMINISTRATION, the FAIR LABOR STANDARDS ACT, and the EXECUTIVE REORGANIZATION ACT, for example—but even they were weaker than proposed. Angered at anti-New Deal Democrats, Roosevelt tried to defeat a number of them in the party’s 1938 primaries. This largely unsuccessful “purge” attempt deepened party divisions and further

emboldened conservative Democrats to oppose the president. Then, in the election of 1938, Republicans gained more than 70 seats in the House and seven in the Senate, strengthening not only the GOP’s presence in Congress but also the power of the conservative coalition that stymied Roosevelt’s domestic program.

By the end of the 1930s, FOREIGN POLICY increasingly commanded attention of Roosevelt and the Congress. Earlier in the decade, Congress had demonstrated its power in foreign policy. With ISOLATIONISTS holding substantial power, the Senate rejected American participation in the World Court, the NYE COMMITTEE carried out its critical investigation of the munitions industry, and Congress passed the NEUTRALITY ACTS that went further than Roosevelt had wanted. As Roosevelt turned to more active and clearly anti-AXIS defense and foreign policies during his second term, he needed the support of southern Democrats in Congress, particularly as much of the midwestern and western delegations of both parties remained anti-interventionist. (The priority Roosevelt gave international affairs by the late 1930s and his dependence upon southern Democratic support further limited chances for domestic reform.) After the outbreak of World War II in the late summer of 1939, isolationists lost influence and Congress supported Roosevelt’s initiatives, beginning with the repeal of the arms embargo in 1939. In the next two years, Congress agreed to such key measures as the National Defense Appropriations Act of 1940, the SELECTIVE SERVICE Act of 1940, and the LEND-LEASE Act of 1941.

For the remainder of Roosevelt’s presidency, Congress largely followed the patterns established from 1937

PARTY STRENGTH IN CONGRESS, 1929–1946

Congress	Years	House			Senate		
		Dem.	Repub.	Other	Dem.	Repub.	Other
71st	1929–31	167	267	1	39	56	1
72nd	1931–33	220	214	1	47	48	1
73rd	1933–34	310	117	5	60	35	1
74th	1935–36	319	103	10	69	25	2
75th	1937–38	331	89	13	76	16	4
76th	1939–40	261	164	4	69	23	4
77th	1941–42	268	162	5	66	28	2
78th	1943–44	218	208	4	58	37	1
79th	1945–46	242	190	2	56	38	1

Source: *The Statistical History of the United States, from Colonial Times to the Present* (Stamford, Conn.: Fairfield Publishers, 1965)

to 1941. Democrats remained the majority party, but the conservative coalition continued to thwart domestic reform. In the ELECTION OF 1940, Roosevelt won an unprecedented third term, but Democrats picked up only seven House seats and lost three more senators. Then in the election of 1942, Republicans picked up nearly 50 congressional seats and nine seats in the Senate, paring the Democratic majority in the House to just 218-208. Those gains partly reflected the typical off-year pattern of losses by the incumbent party, but they also reflected the more limited appeal of New Deal issues in the context of wartime priorities and prosperity. By the early 1940s, moreover, southern Democrats in Congress had become distinctly more conservative than they had been in the early and mid-1930s and were instrumental in opposing liberal programs.

In this context, such New Deal relief programs as the WORKS PROGRESS ADMINISTRATION and the CIVILIAN CONSERVATION CORPS that now seemed unnecessary were eliminated or slashed. Proposals to expand the New Deal went nowhere, and the NATIONAL RESOURCES PLANNING BOARD, which proposed a far-reaching liberal agenda, was terminated. The most important social legislation Congress passed was the GI BILL OF RIGHTS, but that was enacted more as a politically popular reward to veterans than as a piece of domestic reform. As the war came to an end, Congress also ensured generous RECONVERSION policies for BUSINESS. Yet even the conservative 78th Congress that met from 1943 to 1944 did not seriously attack the heart of the New Deal regulatory welfare state. Democrats gained two dozen House seats but lost two more in the Senate in the ELECTION OF 1944, but neither those results nor Roosevelt's fourth-term reelection altered domestic policymaking.

In defense and foreign policy, Congress continued largely to go along with the president's requests during World War II. Although often justifiably critical of early disorganization and inefficiency in the MOBILIZATION programs, and frequently complaining about excessive executive power, Congress nonetheless gave Roosevelt great leeway to establish agencies and implement policies to spur production, mobilize manpower, and check inflation. Such important new agencies as the WAR PRODUCTION BOARD, the OFFICE OF WAR MOBILIZATION, and the OFFICE OF PRICE ADMINISTRATION had little congressional involvement. Congress played an even smaller role in military and foreign policy, whereas commander in chief Roosevelt had extraordinary authority. In planning postwar foreign policy, on the other hand, Roosevelt did have to play close attention to the Senate's authority over treaties in working toward such postwar international organizations as the UNITED NATIONS and the economic agencies coming out of the BRETTON WOODS CONFERENCE.

Trends established during Roosevelt's presidency persisted after 1945. Particularly in foreign policy, Congress typically responded to the president's agenda rather than taking the lead itself. The executive branch was larger, better organized, and more powerful than before. Changes in the NEWS MEDIA contributed to enhancing the power of the presidency, for RADIO (and later television) allowed the president to address the nation and mobilize support more effectively than could the Congress or its individual members. But while the dynamics of policymaking shifted toward the presidency in the 1929-45 era, Congress had by no means been eclipsed. It retained its essential legislative authority on both foreign and domestic policy, and the conservative coalition continued during Harry Truman's presidency and after (until briefly in the mid-1960s) to thwart liberal efforts to expand the regulatory-welfare state established in the 1930s.

### Congress of Industrial Organizations (CIO)

The Congress of Industrial Organizations (CIO) was formed in November 1938 by leaders of 10 dissident unions within the AMERICAN FEDERATION OF LABOR (AFL) who had created its predecessor, the Committee for Industrial Organization, three years earlier. Organizing workers by industry instead of by craft, the CIO quickly became a major LABOR organization with significant economic and political power.

The AFL, which had been the dominant labor organization in the United States since its founding in the 1880s, organized skilled workers according to craft or trade rather than seeking the mass organization of all workers in a particular industry. By the early 1930s, the AFL's approach increasingly frustrated union leaders in mass production industries, such as JOHN L. LEWIS of the UNITED MINE WORKERS OF AMERICA and SIDNEY HILLMAN of the AMALGAMATED CLOTHING WORKERS OF AMERICA, who believed that their members as well as other unskilled,

This cartoon of September 1937 depicts the angry Congress of Industrial Organizations leader John L. Lewis after the Supreme Court's ruling in *Jones and Laughlin Steel v. NLRB* (1937), which upheld the National Labor Relations Act. (Library of Congress)

immigrant, and African-American workers in big industry were being treated like second-class citizens.

Beginning in 1934, Lewis and other unhappy labor leaders called on the AFL at their annual convention to organize mass production workers into industrial unions. The first year, about one-third of the convention delegates agreed, and Lewis repeated his demands in October 1935, but the rank-and-file delegates voted down industrial unionism by an 18,464 to 10,987 margin. Three weeks later, Lewis, Hillman, DAVID DUBINSKY of the INTERNATIONAL LADIES' GARMENT WORKERS UNION, and seven other union leaders formed the Committee for Industrial Organization as a branch within the AFL.

Immediately, Lewis set out to organize the AUTOMOBILE INDUSTRY, the STEEL INDUSTRY, and the RUBBER industry by using United Mine Workers money and key lieutenants such as PHILIP MURRAY, who set up the Steel Workers Organizing Committee (SWOC). After "heresy" hearings, the AFL suspended the Committee for Industrial Organization unions in September 1937, and in November 1938, the committee formally became the Congress of Industrial Organizations, with Lewis as its president.

Between 1935 and 1938, the Committee for Industrial Organization achieved major successes in organizing unions in the mass production industries. In 1936, rubber workers went on strike at Goodyear Tire and Rubber, and Murray and the SWOC traveled throughout the Pennsylvan-

ia steel mills signing up new members. In late December 1936, the United Auto Workers (UAW) began a six-week sit-down strike against General Motors at the large Flint, Michigan, plant, which resulted in the automaker's capitulation to the union's demands for recognition and wage and hour benefits in February 1937. The United States Steel Corporation recognized the SWOC in March 1937, and agreed to their demands.

By late 1937, both the automotive and steel unions had grown to over 350,000 members. The CIO helped set up the Non-Partisan League, which worked for the reelection of FRANKLIN D. ROOSEVELT in the ELECTION OF 1936, and Lewis, a lifelong Republican, endorsed FDR in 1936. The CIO's progress was slowed in late 1937 and 1938 by several factors, the RECESSION OF 1937–1938 that raised UNEMPLOYMENT, the mobilization of moderate and conservative forces against "radical" sit-down STRIKES, and company police forces preventing union organizing at Republic, Bethlehem, and other "Little Steel" plants, and at the Ford Motor Company.

By the early 1940s, however, even Little Steel and Henry Ford could not stop the CIO organizing drive, as membership increased to 2.6 million. A factor that both helped and hurt the CIO was the presence by the early 1940s of active COMMUNISTS or those with pro-communist sympathies, who led several unions and maintained a strong and influential minority in others, including the UAW. Lewis resigned as head of the CIO after the ELECTION OF 1940, when his brief truce with Roosevelt ended and he endorsed Republican WENDELL L. WILLKIE, a decision opposed by his fellow union leaders, the majority of whom backed Roosevelt. Philip Murray succeeded Lewis as president of the CIO.

After PEARL HARBOR, the CIO, along with the AFL, agreed to a no-strike pledge for the duration of the war—although Lewis led the miners out on strike, independent of either large labor organization. During World War II, the CIO organized AIRCRAFT INDUSTRY and SHIPBUILDING workers, and increased its membership by nearly 2 million. Through its political action committee (PAC), the CIO helped forge a strong link in the post-war years between the American labor movement and the DEMOCRATIC PARTY. Strife between the CIO and AFL continued until the two organizations merged in 1955.

### conscientious objectors

During WORLD WAR II, religiously motivated conscientious objectors (COs) received exemptions from serving in combat roles in the armed forces. More than half of the roughly 70,000 men who applied for CO status received it, with some 25,000 serving as noncombatants in the military and 12,000 serving in alternative civilian public service positions.

Anticipating America's entry into World War II, CONGRESS in June 1940 held hearings on what would become the Selective Training and Service Act. Representatives of CIVIL LIBERTIES, religious, and pacifist groups testified at these hearings. They advocated a broad definition of conscientious objection to include a nonreligious exemption as well as provisions for alternative civilian service.

Signed into law by President FRANKLIN D. ROOSEVELT in September 1940, the act provided CO exemption from combat service only for a person who "by reason of religious training and belief is conscientiously opposed to participation in war in any form." Moral or ethical objection to war did not qualify. The act classified COs as noncombatants in the armed forces and also authorized a new status allowing COs to perform alternative work under civilian administration.

To influence the design of civilian service, historic peace churches (Quakers, for example) together with other religious organizations formed the National Service Board for Religious Objectors (NSBRO). NSBRO representatives, SELECTIVE SERVICE, and President Roosevelt agreed in December that NSBRO would be responsible for administering and financing civilian service COs, with the work performed under Selective Service direction. Unlike the noncombatant COs serving in uniform, COs performing civilian service were not paid any wages or benefits by the federal GOVERNMENT.

The plan called for civilian service COs to work in Civilian Public Service (CPS) camps and to continue CIVILIAN CONSERVATION CORPS projects. Projects at new CPS camps as well as in hospitals and on farms were later included. Some 500 COs volunteered as human guinea pigs in medical experiments, and more than 2,000 worked as attendants in hospitals for the mentally ill. Many COs spent the war performing such chores as digging ditches rather than performing work to benefit humanity as they desired.

Originally, noncombatant COs in the military served in medical or supply units around the world. After January 1943, noncombatant assignments were confined to the medical corps, where they often served with great bravery and distinction.

Between 5,500 and 6,000 people went to prison rather than perform duties in civilian service or in the military as noncombatants. Most of those imprisoned were Jehovah's

Witnesses, who had unsuccessfully sought deferments as ministers. Sentences generally ranged from one to three years imprisonment at federal penitentiaries.

### conservatism

Conservatism from 1929 to 1945 was concerned with what conservatives saw as the erosion of economic freedom, individual liberty, and moral values, resulting from the growth of a stronger federal GOVERNMENT and changes in traditional American institutions. Above all, conservatism in the era of the GREAT DEPRESSION, the NEW DEAL, and WORLD WAR II focused on limiting the growing power of the federal government. For most of the period it was primarily reactive, critical of the New Deal and of President FRANKLIN D. ROOSEVELT and their impact upon the country.

The rise of industrial capitalism in America during the decades after the Civil War engendered a debate about the right and capacity of government to regulate BUSINESS in the nation's general interest. In the 19th century, protecting individual liberty and economic freedom and otherwise limiting the power of the state was labeled "classical" or "laissez-faire" LIBERALISM. During the early 20th century, this limited-government approach to economic freedom and individual liberty became the domain of conservatives. Progressives (later redefined as liberals) called for a strong state to restrain the growing economic and political power of big business, to protect individuals from corporate power and political corruption, and to provide for social welfare and moral uplift. Conservatives defended the status quo: limited government, economic and individual freedom, government by elites, and fundamentalist religion.

In the 1920s, conservatism and the REPUBLICAN PARTY regained power because of a backlash against progressivism, the tensions of World War I, and challenges to traditional patterns of American life. Prosperity during the decade enabled business to reassert itself, the Republican administrations of the 1920s pursued pro-business policies and opposed social and economic reform, and a cautious and even docile LABOR movement made little impact on workers' lives. Cultural conservatism was manifest in several ways. The growth of urban immigrant populations threatened the "old stock" base of traditional America, and CONGRESS passed the National Origins Act in 1924, which restricted immigration, especially from southern and eastern Europe. Prohibition was to a significant degree a

response to the drinking habits of an “un-American America.” The controversy over evolution and the Scopes Trial was part of a larger debate between liberal Christianity, urban and with a somewhat secular outlook, and a mainly rural Protestant fundamentalism. The presidencies of Warren G. Harding, Calvin Coolidge, and HERBERT C. HOOVER reflected the economic and cultural conservatism of the times.

When the HOOVER PRESIDENCY began in 1929, there seemed little doubt that conservatism would be the governing mandate for the foreseeable future. Then in 1929 came the calamitous Great Depression. Conservatives held that there were no structural flaws in the national ECONOMY, and that prosperity would return if the market were allowed to correct itself. But despite Hoover’s efforts—which some conservatives criticized as going too far—the economy continued to fall and UNEMPLOYMENT soared. Conservatism seemed discredited, and certainly unsuccessful, and a new liberalism emerged in the 1930s, similar in ideas and programs to the old progressivism, with the goal of reforming capitalism.

After the election of Franklin D. Roosevelt in the ELECTION OF 1932, conservatism was defensive and sometimes confused, partly because of the new president’s adroitness in moving around the center of the ideological spectrum. The major measures of the FIRST NEW DEAL of 1933—the NATIONAL INDUSTRIAL RECOVERY ACT, the AGRICULTURAL ADJUSTMENT ACT, the FEDERAL EMERGENCY RELIEF ADMINISTRATION, the TENNESSEE VALLEY AUTHORITY, and the CIVILIAN CONSERVATION CORPS—were looked upon first with skepticism, then outright hostility by conservatives. By 1934, conservatives were harshly critical of the New Deal. Former president Hoover led the critics, calling for a return to the philosophy of individualism. A number of business and other conservative organizations, ranging from the U.S. Chamber of Commerce and the National Association of Manufacturers to the Sentinels of the Republic and the National Taxpayers League, all weighed in against the New Deal.

The most visible and vocal of the conservative organizations was the AMERICAN LIBERTY LEAGUE, a diverse group of businessmen, industrialists, and conservative Democrats, who were bankrolled with Du Pont money and led by dissident Democrats including former presidential nominees John W. Davis and Alfred E. Smith. For a brief time, the Liberty League raised nearly as much money as both major parties to support their message that the New Deal was an unconstitutional peril to the nation’s economy and institutions. However, for all their financial resources and organizational planning, the American Liberty League failed to stop Roosevelt and the New Deal, or for that matter, even to attract a wide group of conservatives under their banner. Hoover and other small-town, heartland con-

servatives, for example, distrusted the Wall Street-oriented leadership of the league.

Further conservative attacks on Roosevelt and the New Deal came from two additional sources. One was a small but committed group of intellectuals and journalists, some of whom could be classed as libertarians, who believed in government noninterference in both the economic and social spheres and retained a belief in social Darwinism; the other was a small but loud group of neofascists who came from the far right. The first group included such intellectuals as Irving Babbitt, Paul Elmer More, and George Santayana, and journalists such as Henry L. Mencken and Albert Jay Nock. Mencken, who had been a hero to liberals and civil libertarians for his attacks on CENSORSHIP and closed-minded thinking in the 1920s, became a caustic critic of the New Deal and of Roosevelt.

On the far right, the best known was Gerald L. K. Smith (a former associate of HUEY P. LONG), who saw the New Deal as either a “Red” or “Jewish” plot. Combining fundamentalist Christianity with ANTI-SEMITISM, the neofascists labeled the New Deal as the “Jew Deal,” because of the visible number of JEWS in the administration. Until he was later silenced by the Catholic Church, FATHER CHARLES E. COUGHLIN became notorious for his anti-Semitism mixed with harsh denunciations of the New Deal and Wall Street.

The programs of the SECOND NEW DEAL in 1935, such as the SOCIAL SECURITY ACT, the NATIONAL LABOR RELATIONS ACT, and the WORKS PROGRESS ADMINISTRATION, made labor and the working class central to liberal policy (and to the politics of the DEMOCRATIC PARTY). These measures further antagonized business conservatives as well as upper-class easterners who believed that Roosevelt, one of their own, was a “traitor to his class.” The REVENUE ACT OF 1935 and other New Deal efforts to reform TAXATION also alienated conservatives, business, and the wealthy.

With Congress dominated by liberal Democrats in the mid-1930s, only one branch of government, the SUPREME COURT, remained a bastion of conservatism at the federal level. To the delight of conservatives, the court upheld economic liberty by invalidating the NRA in 1935 and the AAA in 1936. Overturning other New Deal measures as well, the Court seemed to be sharply restricting the role of government and was due to rule on cases involving the National Labor Relations Act and Social Security.

In 1936, conservative forces geared up to defeat Roosevelt. The Liberty League gave money to Republican Party nominee ALFRED M. LANDON, but seemed more interested in attacking Roosevelt directly. The Coughlin–Gerald Smith faction formed the UNION PARTY, which won fewer than 900,000 votes. Roosevelt, in seeking reelection, relished attacking his conservative and well-heeled oppo-

nents, saying that he “welcomed their hatred.” He won a landslide victory, and Democrats controlled the Congress by enormous majorities in both the House and the Senate.

The ELECTION OF 1936 did not still the forces of conservative opposition. Roosevelt, angry about the Supreme Court overturning New Deal legislation (and denouncing the justices as “nine old men”), sent to Congress a court reorganization bill, called the COURT-PACKING PLAN by opponents. Conservatives in Congress, particularly southern Democrats and Republicans, joined by progressives from the GOP and maverick Democrats, eviscerated the court bill, although Roosevelt claimed to have lost the battle but won the war, as several of the justices retired and were replaced by liberals.

But perhaps Roosevelt won only a campaign and lost the larger struggle, for the court-packing episode helped change the dynamics of Congress and increase the influence of conservative legislators on Capitol Hill. Only a few years earlier, conservatives in Congress chiefly comprised eastern Republicans and a few southern Democrats. By the late 1930s, large Republican gains in the 1938 elections and the defection of a number of southern Democrats and progressive Republicans helped create a powerful CONSERVATIVE COALITION that emerged as a barrier to the New Deal’s expansion of liberal reform. The court-packing plan played a role in that, as did labor unrest, the RECESSION OF 1937–1938, and, for the southerners, concerns about the growing strength of urban northern Democrats in the party and their CIVIL RIGHTS efforts. As outlined in the “Conservative Manifesto” of November 1937, the conservative coalition opposed the New Deal regulatory welfare state and championed the core conservative issues of the era: limited central government, lower taxes, balanced budgets, individual responsibility, economic freedom, states’ rights, and property rights.

By the late 1930s, FOREIGN POLICY became an issue that affected all Americans as World War II approached. Conservatives, as with every political and ideological group, were divided between intervention and nonintervention. Conservative southern Democrats often supported anti-AXIS policies. A number of important conservatives were ISOLATIONISTS, however, as indicated by the leadership of the AMERICA FIRST COMMITTEE and by such important voices in Congress as ROBERT A. TAFT. Those on the far right, the neofascists, were thinly veiled Nazi sympathizers.

World War II strengthened conservatism in a number of ways. Wartime prosperity made liberal programs seem unnecessary, and wartime priorities made them seem diversionary. Business had more influence in Washington during the war than in the New Deal years as government MOBILIZATION agencies used businessmen in important positions. In 1942, the Republicans nearly won numerical

control of the House of Representatives, and the conservative coalition strengthened its control of Congress. Such liberal Depression-era RELIEF programs as the CCC and the WPA were terminated. The strike by JOHN L. LEWIS’s miners in 1943 gave antilabor conservatives the impetus to pass the Smith-Connally Act, which placed restrictions on certain union activities and presaged the postwar Taft-Hartley Act. The wartime Congresses did not roll back the heart of the New Deal, but conservatism plainly was resurgent.

In 1944, an important book was published that helped guide the postwar conservative movement—*The Road to Serfdom*, written by economist and Austrian émigré Friedrich A. von Hayek. In his book, Hayek contended that centralized state planning (such as the New Deal) inevitably led to totalitarianism. A free market would guarantee freedom; economic planning and social welfare in the hands of government would lead to dictatorship. Despite the general moderation of the Truman and Eisenhower presidencies, what has been called the “liberal consensus” generally characterized early postwar America. But the antistatist ideas of Hayek and of the 1937 “Conservative Manifesto,” joined to fierce ANTICOMMUNISM in the cold war, continued to dominate conservative thought. By the 1960s, beginning especially with the movement associated with Arizona senator Barry Goldwater, conservatism gained significant new strength and influence.

### conservative coalition

The conservative coalition was an informal alliance of Republicans and conservative Democrats in CONGRESS that formed during the second term of President FRANKLIN D. ROOSEVELT to oppose the NEW DEAL. Such opposition had been minimal in the first term. The devastating collapse of the ECONOMY in the early years of the GREAT DEPRESSION from 1929 to 1933 made decisive action seem essential. Democrats, in control of the national GOVERNMENT after the ELECTION OF 1932, wanted the party to make a positive record. Party loyalty and their generally

good personal relationships with Roosevelt brought support from most conservative as well as liberal Democrats, including southern Democrats who recognized also that New Deal aid was crucial to their region and popular among their constituents. Roosevelt could count as well on support from progressive Republicans, and liberal Democrats gained even more power in Congress in the election of 1934. With the overwhelming Democratic victory in the ELECTION OF 1936 that produced top-heavy Democratic majorities of nearly 4-1 in the House and 5-1 in the Senate, Roosevelt and the New Deal seemed to have little effective opposition.

Yet within a year, a group of Republican and conservative Democrats, dominated by southern Democrats, had issued a "Conservative Manifesto" enunciating major themes of CONSERVATISM in the Roosevelt years. The manifesto insisted upon balanced budgets, lower taxes, limited central government, states' rights, and property rights, and it sharply criticized the emerging welfare state of the New Deal. Republicans and conservative Democrats increasingly cooperated across party lines in support of those principles and succeeded in thwarting much of Roosevelt's second-term agenda. The conservative coalition, a loose working alliance varying from issue to issue, included at its core most Republicans, frequently joined by a large number of southern Democrats and a scattering of rural and conservative Democrats from other areas. With half or more of the membership of both houses coming from rural constituencies, an "antimetropolitan" ideology, affronted by the growing urban liberalism of New Deal policy, helped bring congressional conservatives together.

A number of circumstances and events gave rise to the conservative coalition. A key factor was the changing nature of the national DEMOCRATIC PARTY during Roosevelt's presidency. Democrats became the party of the big-government regulatory welfare state and increasingly pursued the agenda of urban liberalism. Northern liberals began eclipsing southerners in party councils and decisions, and government money and programs seemed to go increasingly to labor, to the urban unemployed and impoverished, to ethnic groups and to AFRICAN AMERICANS. Not only did rural constituencies and interests have less power and influence, but New Deal RELIEF, LABOR, SOCIAL SECURITY, and AGRICULTURE programs threatened to upset traditional economic and political patterns in the SOUTH. Southerners were further provoked by the 1938 antilynching bill that was supported by northern Democrats before being killed by a filibuster by southern Democrats. Most Republicans shared concerns about the size, cost, and focus of government programs with conservative Democrats, and they shared as well a sense that under Roosevelt and the New Deal excessive power was gravitating toward the executive branch at the expense of the Congress.

A series of developments in 1937 and 1938 then brought the coalition into being and led to the November 1937 "Conservative Manifesto." Roosevelt's 1937 inaugural address was a ringing call to expand the New Deal. Early in the year, he introduced an executive reorganization bill, which threatened further to increase presidential power at the expense of the Congress. Then he proposed the COURT-PACKING PLAN, which aroused conservatives (and many liberals as well). As one conservative Texas Democrat put it, "Boys, here's where I cash in"; and conservative Democrats worked across party lines with Republicans to oppose the bill. The sit-down strikes conducted by the CONGRESS OF INDUSTRIAL ORGANIZATIONS, in which strikers occupied plants seeking union recognition, seemed a radical assault on property that was enabled by New Deal policy. The RECESSION OF 1937-1938 sent the economy spiraling downward again in the fall, suggesting that New Deal economic policy had failed and leading conservatives to insist upon small-government, budget-balancing approaches.

Court-packing, labor unrest, and the "Roosevelt recession" also weakened public support for the president, emboldening New Deal opponents, as did the reelection in the mid-1930s of key conservative Democrats, which made them feel more secure in opposing FDR. Angered at the anti-New Deal Democrats, Roosevelt worked to defeat a number of them in the 1938 party primaries—but his "purge" attempt was largely an embarrassing failure and deepened the fissures in the party. In the election of 1938, Republicans gained some 70 seats in the House and seven in the Senate, significantly enlarging the Republican contingent in the Congress and strengthening the conservative coalition. By the late 1930s, moreover, the coming of WORLD WAR II shifted Roosevelt's priorities to defense and foreign policy, where he needed support from southern Democrats. For the remainder of Roosevelt's presidency, indeed well beyond it, Republicans and conservative Democrats effectively produced a sort of stalemate in domestic policy, in which the New Deal would not be significantly expanded or rolled back.

### convoys

Following the outbreak of WORLD WAR II in 1939, the Royal Navy began convoying seaborne commerce with the limited resources available to it. This practice entailed naval vessels as escorts to protect merchant ships. Usually,

a rectangular column was deployed 12 ships abreast and four to six ships deep for a distance of 1,000 yards. Several of these columns would make up the actual convoy while armed escort vessels assembled in the van, on the flanks, and in the rear of the procession. SUBMARINES launching a torpedo attack on the convoy were likely to be quickly detected by sonar and attacked by rockets and depth charges, sometimes with deadly effect. Initially the German attackers enjoyed modern submersibles and torpedoes, as well as the additional advantage of AIR POWER, and British shipping suffered enormously. But the BATTLE OF THE ATLANTIC slowly turned in the Allies' favor following American entry into World War II and the influx of numerous U.S. NAVY warships into the struggle. The Allies were further abetted by improved sonar and detection technology, better naval intelligence, deciphering of the German submarine code, and most important, the introduction of small, escort AIRCRAFT CARRIERS into the convoy system. This enabled armed warplanes to attack U-boats directly, and by 1944 the enhanced convoy system had effectively won the Battle of the Atlantic. The Germans managed to sink nearly 2,600 merchant vessels totaling 14.5 million tons, but at a cost of more than 780 U-boats sunk, along with 32,000 highly skilled sailors.

### **Coral Sea, Battle of the** (May 1942)

The Battle of the Coral Sea took place from May 3 to May 8, 1942. The Imperial Japanese Navy had been on the offensive since the attack on PEARL HARBOR in December 1941, and by the spring of 1942 was threatening Australia. Suffering from what has been called the “victory disease,” the Japanese overreached themselves. At the Battle of the Coral Sea, the U.S. NAVY was able to check Japanese expansion to the south; and although tactically neither side achieved full victory, strategically the battle was a significant American success. The battle was also important for revealing the new realities of naval warfare in which AIRCRAFT CARRIERS, not battleships, were the major force: Surface ships never encountered each other, and the battle was fought entirely by planes from the two fleets' aircraft carriers.

To cut off Australia from U.S. support, the Japanese aimed to win control of the Coral Sea, bordering Australia to the north, by taking over Port Moresby, on the southwest tip of New Guinea, and Tulagi in the SOLOMON ISLANDS. But American INTELLIGENCE was able to track movements of the Japanese fleet and to break the Japanese code, thus

allowing Admiral CHESTER W. NIMITZ to have two carrier groups ready to meet the Japanese. The battle began on May 3, with the Japanese invasion of Tulagi, though it did not reach full scale until May 7. On that day, the Americans were able to sink a Japanese light carrier and force the Japanese to abort their Port Moresby invasion. The battle ended on May 8, 1942, after a fierce naval air battle. The Japanese temporarily lost use of two of their most valuable ships, the badly damaged carriers *Shokaku* and *Zuikaku*, on this day, and retreated from the Coral Sea, ending their attempt on Port Moresby and their pressure on Australia. Because the American carrier *Lexington* was lost as a result of the action (and the carrier *Yorktown* damaged), the Japanese had something of a tactical edge in the battle; and the Japanese control of Tulagi would be significant in later combat in the Solomons. But the Japanese advance south toward Australia had been halted, and because of the Battle of the Coral Sea, the Japanese could not use their damaged carriers *Shokaku* and *Zuikaku* a month later at the pivotal BATTLE OF MIDWAY.

### **Coughlin, Father Charles E.** (1891–1979) *priest, radio personality*

Father Charles Edward Coughlin, the controversial “radio priest,” was an important figure in American politics in the 1930s and organized an unsuccessful political challenge to President FRANKLIN D. ROOSEVELT in the ELECTION OF 1936.

Coughlin was born on October 25, 1891, in Hamilton, Ontario, Canada, and at the urging of his mother decided to enter the Roman Catholic priesthood. He taught at Assumption College in Ontario and then received his first, and only, parish—the Shrine of the Little Flower outside Detroit in Royal Oak, Michigan. Using the relatively new medium of RADIO in an effort to raise funds for his struggling parish and increase its membership, Father Coughlin gave his first radio sermon on October 17, 1926. The program quickly became popular, and the donations sent to Father Coughlin allowed him to syndicate his show in 1929 and reach listeners throughout most of the Midwest. When he began broadcasting *The Golden Hour of the Little Flower* on CBS in 1930, Coughlin was heard by up to 40 million Americans every Sunday night.

Until 1930, Father Coughlin's radio program was primarily religious in nature. But as the GREAT DEPRESSION

Father Charles E. Coughlin (Library of Congress)

deepened, his sermons became more overtly political, as he denounced President HERBERT C. HOOVER and the group he blamed for the depression—international bankers. By 1932, Coughlin had become an enthusiastic supporter of Franklin D. Roosevelt, whom he believed would radically reform the American economy. “Roosevelt or Ruin,” he told his audience. Roosevelt, aware that Coughlin reached millions of listeners, cultivated the radio priest’s support. However, although Coughlin saw himself as a critical component of Roosevelt’s victory in the ELECTION OF 1932, the relationship was never a close or personal one. By 1934, frustrated by his lack of influence and by the BANKING policy of the FIRST NEW DEAL and the administration’s efforts to regulate rather than dismantle big BUSINESS, Coughlin broke with Roosevelt.

In November 1934, Coughlin created the National Union for Social Justice (NUSJ) and used the organization to increase his following and challenge Roosevelt and the NEW DEAL. At the heart of the NUSJ platform were its demands for establishing a central bank, nationalizing public utilities, and increasing the coinage of silver. Attracting a following dominated by working-class and lower-middle-class CATHOLICS who found Coughlin’s populist message appealing, the NUSJ claimed to have 8 million members at its peak in 1936. In addition, millions more were sympathetic to Coughlin’s message attacking international bankers and political parties and calling for radical monetary reform.

An apparent test of Coughlin’s power came in the Senate debate of early 1935 over the United States joining the World Court. Coughlin saw the World Court as dominated by the same international bankers he blamed for the depression, and he urged his listeners to call, telegram, and write to their senators to vote against the World Court. When the Senate voted against membership, it seemed that Coughlin had proven his political muscle. But the unsuccessful political party that he created in the presidential election of 1936 revealed how limited the radio priest’s power really was.

In 1936, Coughlin, Dr. FRANCIS TOWNSEND, and Gerald L. K. Smith, who had taken over the Share Our Wealth program following the death of HUEY LONG, joined to form the UNION PARTY. The new party nominated North Dakota congressman William Lemke for president, but it lacked both unity and organization and Lemke won less than 2 percent of the popular vote. The results reflected the facts that Coughlin’s followers also tended to support Roosevelt and that they overwhelmingly preferred Roosevelt to Coughlin’s candidate. Coughlin himself hurt the Union Party by denouncing the popular FDR as “anti-God” and as “Franklin Double-Crossing Roosevelt.” Rejected by the voters, denounced by superiors in the Catholic hierarchy, and likening himself to the martyred Jesus Christ, Coughlin announced his retirement from public life after the election.

Unhappy out of the spotlight, Coughlin resumed his radio show in January 1937, but his popularity was never the same. He became increasingly anti-Semitic; when he began speaking favorably of Adolf Hitler and Benito Mussolini in 1940, he lost all but his diehard supporters and his radio show was taken off the air. A fringe figure by the time the United States entered WORLD WAR II, Coughlin left the public arena for good in 1942. As part of the government’s CENSORSHIP of far right- and left-wing groups, the postmaster general prohibited delivery of Coughlin’s magazine, *Social Justice*, and the attorney general arranged to have Coughlin’s archbishop silence him. Father Coughlin then retreated back to his parish. He retired in 1966 and died an obscure figure in 1979.

### court-packing plan

The “court-packing plan” of 1937 was the controversial attempt by President FRANKLIN D. ROOSEVELT to enlarge

the SUPREME COURT so that it would make more favorable rulings on NEW DEAL programs.

In a remarkable period from May 1935 to May 1936, the Supreme Court had invalidated a number of major New Deal measures, including the NATIONAL INDUSTRIAL RECOVERY ACT and the AGRICULTURAL ADJUSTMENT ACT. The reasoning in those decisions suggested, moreover, that the SOCIAL SECURITY ACT and the NATIONAL LABOR RELATIONS ACT (Wagner Act) were likely to be overturned as well, and that a federal wages and hours law that President Roosevelt had in mind would stand no chance. One obvious possibility to protect the New Deal from judicial veto was a constitutional amendment to limit the Court's power or to augment the authority of the CONGRESS in economic and social areas. But agreeing upon wording proved difficult, and any amendment would need approval by two-thirds majorities in each house of Congress and then ratification by 36 states—a slow and uncertain process at best, especially when the Roosevelt administration believed that quick action was needed in order to safeguard programs made necessary by the GREAT DEPRESSION.

Congress also had the authority to alter the number of judges on the Supreme Court and other federal benches, and had done so in the past. Many of the unfavorable decisions, moreover, had been decided by narrow 5-4 and 6-3 votes, with four conservative justices—Willis Van Devanter, James C. McReynolds, George Sutherland, and Pierce Butler—consistently voting against the New Deal, often joined by Owen J. Roberts and Chief Justice Charles Evans Hughes. The liberal wing of the Court—Justices Louis D. Brandeis, Harlan Fiske Stone, and Benjamin N. Cardozo—believed that the Constitution was expansive enough to support most New Deal programs and that in any case the Court should more prudently exercise its power of judicial review.

On February 5, 1937, Roosevelt announced his Judicial Procedures Reform Bill, which was quickly dubbed the “court-packing bill.” If a federal judge who had served at least 10 years did not retire six months after reaching age 70, the president could appoint a new judge to the bench—up to as many as six to the Supreme Court and 44 to lower federal courts. (The average age of Supreme Court justices, not coincidentally, was 71.)

Roosevelt's proposal set off a furor. He had launched the bill with no advance warning to key congressional leaders and with no public mention in the 1936 presidential campaign or otherwise. He claimed he wanted a younger and more efficient judiciary, when he plainly wanted a more responsive and liberal one. Conservatives feared

that the bill was part of an administration plan to subordinate the legislative and judicial branches to the executive branch. Many liberals were also unhappy, upset not only by Roosevelt's tactics but worried about what a different kind of president might do with such powers. Even so, it was widely assumed that the court-packing bill would pass, given Roosevelt's landslide victory in the ELECTION OF 1936 just a few months earlier and his apparent power in the overwhelmingly Democratic Congress.

But the proposal encountered insuperable obstacles. Conservative Democrats joined with Republicans in working against it, and liberal Democrats often were passive at best. Chief Justice Hughes made it plain that the Court was neither inefficient nor behind in its work. In the famous “switch in time that saved nine,” Hughes and Roberts joined in 5-4 decisions that upheld the National Labor Relations Act in April and the Social Security Act in May, and in May conservative justice Van Devanter retired. With a liberal Supreme Court evidently assured, the court-packing bill's chances faded quickly, even after FDR agreed to a slightly revised version and became more forthright about his real purpose. Public opinion, so far as it can be measured, evidently turned against the proposal, too. Roosevelt, uncharacteristically politically tone-deaf, persevered nonetheless, but met humiliating defeat.

In the aftermath, Roosevelt claimed that he lost the battle (the court-packing bill) but won the war (a more liberal Supreme Court). He was partly right, for the Court would not invalidate another piece of New Deal legislation; and as vacancies occurred on the Supreme Court, Roosevelt was able to form a more liberal “Roosevelt Court.” But Roosevelt lost more than the court-packing bill. He also lost a cooperative Congress that would approve liberal legislation, as the disaffection of conservative Democrats over court-packing helped produce the CONSERVATIVE COALITION in Congress that would stymie and limit the New Deal for the remainder of Roosevelt's presidency. And although the Court had apparently changed direction in 1937 (some scholars believe that the Court was trending toward a more expansive view of GOVERNMENT policy in any event) and ratified the modern regulatory welfare state, it retained its powers of judicial review and would exercise them robustly in the years and decades to follow.

## demobilization

The surrenders of Germany and Japan in the spring and late summer of 1945 marked the beginning of the demobilization of the massive military and industrial machine that the United States had assembled to fight WORLD WAR II. The demobilization of the armed forces proceeded at a rapid pace. During the two-year period from June 1945 to June 1947, the number of military personnel dropped from 12 million to 1.5 million.

Almost immediately after V-J DAY in mid-August 1945, and weeks before Japan's formal surrender in early September aboard the USS *Missouri*, pressure began to mount to reduce the size of the armed services and to reconvert the nation's industry to peacetime production. Within a few months, disgruntled U.S. servicemen stationed overseas were protesting for Washington to bring them home so they could get on with their lives, especially to take civilian jobs and raise families. Idle and bored GIs in Manila booed top brass during one demonstration. Others, who were fed up with regulations and regimentation, protested in Frankfurt and also in Paris, where they marched down the Champs Elysees and yelled "scab" and "slacker" at American soldiers who refused to join the march. Some even purchased advertising space in American newspapers to voice their demands. Many civilians joined the protests, organizing into clubs and petitioning Washington for the immediate release of their husbands, sons, and loved ones from active duty.

The pressure at home and abroad forced the military to scrap its plans for an orderly partial demobilization. Originally the War Department had planned discharges based on a point system that recognized the length and difficulty of service. The department, however, decided to release all men with two years' service. U.S. ARMY Chief of Staff Dwight D. Eisenhower soon ordered his commanders to return home any men "for whom there is no military need."

The demobilization of U.S. forces proceeded at an alarming rate, one that President Truman admitted

amounted virtually to a "disintegration." Soon after Japan's surrender, the president announced that the army and the U.S. ARMY AIR FORCES would be cut to 1.95 million by June 1946. By spring 1946, he had further reduced the number to one million as of July 1946. The U.S. NAVY was reduced to less than 500,000 by 1947, the U.S. MARINES to less than 100,000. Along with the release of service members came training camp closures and the destruction and sale to private industry of ships and unneeded war equipment. The hasty discharge of seasoned specialists and combat veterans particularly damaged military readiness. Because of global instability, and at the president's request, Congress extended the SELECTIVE SERVICE Act to March 31, 1947.

The war's sudden end caught the Truman administration unprepared for peace and without a plan for confronting changing and potentially volatile domestic and global situations. Fears that the rapid demobilization and RECONVERSION would disrupt the ECONOMY and perhaps mean a return to depression conditions proved unfounded. Wartime savings, quick reconversion, pent-up demand for consumer goods, the return of many women to the home from industry jobs, and the 1944 GI BILL OF RIGHTS that sent many veterans to college kept UNEMPLOYMENT low and the economy strong.

In foreign affairs, the president's immediate problem was twofold. He had to find a way to maintain a military force sufficient both for the occupation of Germany and Japan and for ensuring global stability and national security. Balancing these requirements proved difficult, especially considering public pressure and Truman's tight fiscal policies.

Compounding his task was residual, although hardly dominant, isolationist sentiment in Congress. Believing that AIR POWER and the exclusive possession of the ATOMIC BOMB would ensure the nation's security, some conservative lawmakers wanted the president to leave the world's problems to the UNITED NATIONS. Taking this approach,

## 92 Democratic Party

they believed, would require only limited U.S. military participation. Their sentiments changed, however, as tensions between the United States and Soviet Union intensified in mid- and late 1940s. The reduction of military strength finally ended with the outbreak of war in Korea in June 1950.

Although Americans did not realize it at the time, a good deal of the regimentation and wartime way of life that had developed with the MOBILIZATION for World War II would not completely disappear with the end of the war. During the next few years, policymakers would find themselves having to come to grips with exactly how much of the wartime apparatus and system of doing things they should retain in order to confront new postwar problems.

### Democratic Party

From 1929 to 1945, the Democratic Party went from a disorganized minority party to the majority party of the nation. As the decade of the 1920s neared its end, the prospects of the Democratic Party in national politics seemed dim. Only two Democrats had won the presidency since 1860; the REPUBLICAN PARTY had been the normal majority party since the mid-1890s; and Republicans had dominated national politics throughout the 1920s. In the election of 1928, HERBERT C. HOOVER defeated the Democratic presidential nominee, Alfred E. Smith, by 58.2 to 40.9 percent of the popular vote. In the CONGRESS elected that year, Republicans outnumbered Democrats by 267-167 in the House of Representatives and by 56-39 in the Senate. The Republican Party's organizational strength, longstanding majority status, and identification with the prosperity of the 1920s seemed to promise its continued dominance.

The Democratic Party did have some areas of significant strength. The SOUTH, where few AFRICAN AMERICANS could vote, had been solidly Democratic since the era of the Civil War and Reconstruction, and Democrats controlled a number of CITIES outside the South because of strong organizations and support from Catholic immigrant groups (especially IRISH AMERICANS). But the party had severe weaknesses as well. It was more a collection of state and local machines than an organized national party. Its two major areas of strength, old-stock rural Protestants

in the Midwest and South and ethnic urban CATHOLICS in the North, were bitterly at odds on the polarizing social issues of the 1920s (Prohibition and IMMIGRATION restriction, for example), and it had taken the divided Democrats 103 ballots to decide upon a compromise presidential nominee in 1924. Al Smith, the Irish-American Catholic governor of New York, won the party's nomination in 1928; but while he rallied millions of new urban voters to the Democratic Party, he carried only six states in the deep South plus heavily Catholic Massachusetts and Rhode Island. In addition to its deep cultural and geographical divisions, the Democratic Party offered little real policy alternative to the Republicans and no common position on most big issues. "I don't belong to an organized political party," quipped the humorist Will Rogers. "I'm a Democrat."

The GREAT DEPRESSION provided the Democrats the opportunity to regain national power. The two parties essentially broke even in the election of 1930, and when the new Congress met, Democrats had a narrow majority in the House and a coalition of Democrats and progressive Republicans were able to control the Senate when they wished. But the Democrats were unified only in their efforts to blame the collapse of the ECONOMY on Hoover and the Republicans. A number of leading congressional Democrats from the South, including Speaker of the House JOHN NANCE GARNER of Texas, were traditional small-government conservatives, as unwilling as Hoover to support expensive or expansive new federal programs. Others in the party wanted more GOVERNMENT action, but progressive southern and western rural Democrats typically emphasized assistance to AGRICULTURE, while liberal urban Democrats focused on help for workers and the cities.

As the Democrats prepared for the ELECTION OF 1932, many supported the popular and progressive governor of New York, FRANKLIN D. ROOSEVELT. Roosevelt had ties to both rural and urban Democrats, partly through his efforts in the 1920s to have the party establish an effective national organization, and he understood that Democrats had to stress the economic problems that might unite the party. Although opposed by leading Democratic conservatives, and by Al Smith, who wanted renomination, Roosevelt was the early front-runner. He won the necessary two-thirds of the convention delegates on the fourth ballot, when John Nance Garner, subsequently nominated for vice president, helped deliver enough votes to ensure Roosevelt's nomination.

The election of 1932 was in many ways a transitional one for the Democratic Party. Roosevelt and the Democrats swept to landslide victory, with 57.4 percent of the presidential vote and with margins of 310-117 in the House and 60-35 in the Senate. But the election marked more a rejection of Hoover and the Republicans than an affirma-

tion of Roosevelt and the Democrats, who waged a campaign that was inconsistent and unclear, criticizing Hoover for doing and spending too much as well as for doing too little to deal with the depression. The Democrats' forthright opposition to Prohibition was perhaps the most obvious distinction between the two parties. Yet if Roosevelt did not clearly or consistently outline what would become the NEW DEAL, his greater emphasis on providing action for the economy and RELIEF for the unemployed distinguished him from Hoover. And the election had transferred power to the Democrats and given them a chance to govern—and to build a new coalition of voters that would keep them in power.

Once in office, Roosevelt began to implement the New Deal and, helped by new national chairman JAMES A. FARLEY, to build the organizational strength and voter support that made Democrats the majority party. Democrats gained strength in both houses of Congress in the election of 1934, a significant departure from the usual pattern of the incumbent president's party losing substantial ground in off-year elections and a telling confirmation of public support for Roosevelt and the New Deal. The Democratic gains, moreover, came especially from northern and urban constituencies increasingly central to the party's voter base and policy agenda. The social reform programs of 1935 came in significant measure from the greater strength of urban liberals in Congress, typified in many ways by Senator ROBERT F. WAGNER of New York. The new directions of the party upset conservative Democrats, some of whom joined Al Smith in the anti-New Deal AMERICAN LIBERTY LEAGUE.

The ELECTION OF 1936 confirmed the Democratic Party's new urban, liberal orientation and established it as the nation's new majority party. At their national convention, the Democrats abolished their requirement of a two-thirds majority for nomination, which ended the veto power that southern Democrats had long enjoyed. Roosevelt tried to rally the working class and lower middle class behind him and his party with rhetoric castigating "economic royalists." Democrats made particular efforts to turn out the vote among ethnic groups and LABOR, and unions in 1936 provided the party unprecedented financial and organizational support. Led by ELEANOR ROOSEVELT and MARY W. DEWSON of the Democratic National Committee, the party made special efforts to bring women to the polls. Secretary of Labor FRANCES PERKINS was the first woman cabinet member ever, and the New Deal's WOMEN'S NETWORK brought political dividends. Roosevelt's appointments of Catholics and JEWS to important government positions in unprecedented numbers helped solidify the support of those groups. Similarly, Roosevelt named many African Americans, such as MARY McLEOD BETHUNE, to significant posts, and the resulting informal BLACK CAB-

INET as well as assistance from New Deal programs led black Americans to vote Democratic in unprecedented numbers. New Deal programs, relief especially, also helped Democratic urban politicians build or strengthen powerful organizations that brought voters to the polls.

In November, FDR won more than three-fifths of the presidential vote, losing (as Farley had predicted) only Maine and Vermont, and Democrats swept to even more top-heavy control of the Congress, with margins of nearly 4 to 1 in the House and 5 to 1 in the Senate. Unlike 1932, the electorate had voted not just against the Republicans, but for Roosevelt, the Democrats, and the New Deal. The Democratic Party's new majority came from the Roosevelt Coalition of voters, based partly on the South but even more on overwhelming support in northern metropolitan areas from working-class and lower-income voters, Catholic and Jewish ethnic groups, and African Americans. And the realignment of the 1930s had not only made the Democratic Party the majority party at the national level but, in varying degrees, had also built substantial new Democratic strength in many states and cities.

Yet the Democratic Party's new top-heavy majority status carried its own difficulties. A coalition so broad was hard to keep together, as subsequent years would show. Many voters in 1936 had supported Roosevelt but did not necessarily think of themselves as Democrats. Democratic politicians and officials at the state and local levels, particularly in the South, were often lukewarm at best toward New Deal policy and at odds with liberal Democrats in Washington. Rural Democrats thought too much attention and money were going to urban areas and industrial workers. Southerners feared also that too much power was going to the North and that New Deal programs were undermining traditional social, political, and even racial patterns in the South. Senator JAMES F. BYRNES of South Carolina complained that the introduction of ANTILYNCHING LEGISLATION meant that southerners had "been deserted by the Democrats of the North," and by the end of the decade southern Democrats in Washington increasingly opposed social and economic reform. Conservative Democrats retained their small-government preferences and feared the growing size, power, and costs of the federal government. At times, Roosevelt seemed inclined to try to reorient the party system along clear liberal/conservative lines, but it was never a priority and was probably impossible given the exigencies of the era and the obstacles of the American political system.

Democratic factionalism flared in 1937 and 1938, when conservative, most southern and rural, Democrats in the Congress, began joining with Republicans to form a CONSERVATIVE COALITION that would stymie much of Roosevelt's domestic agenda for the remainder of his presidency. In addition to their concerns about the federal government
